*** Preface

Before Dale F. Eickelman, the study of Islamic societies was largely the domain of the Orientalists. Those towering old world figures - Caetani, Levi Della Vida, Margoliouth - loom large in the backdrop of Dale’s first mature work, an inventive, anthropological study of the pretender Musaylima’s failed mission in seventh century central Arabia (Eickelman 1967). To that venerable trade and remote time and place, Dale brought a gnawing sense of the dynamism of historical change and social transformation. Musaylima failed, Dale argued, because his message could not transcend his own tribal kin group, the Bani Tamim, whereas Muhammad’s message did. The theological rupture with the past, he insisted, did not dictate

a comparable social rupture in every instance. Ideas matter, but how and why they matter can be understood only within a specific context, one rendered intelligible through mastery of the language of the locale and intensive engagement with its residents, however many centuries separate them from the object of scholarly inquiry. In “Musaylima” we see the first evidence of Dale’s capacity for crisp argumentation and narrative (a Midwestern trait?), his synthesizing of diverse concerns and interests, and, most importantly, his creative ambitions. Drawing links between Arabia past and present, we also observe the scholar’s first encounter with the question of knowledge, authority, and change in Muslim societies, that is, the first outlines of a conceptual framework that would so influence the fields of anthropology and Middle East studies.

Dale moved swiftly out of the seventh century and into the world of modern Muslim learning and knowledge production in North Africa. In this he followed Clifford Geertz, but more explicitly the great French ethnographer and colonial administrator, Jacques Berque (d. 1995). Eickelman lauded Berque for almost singlehandedly preserving - against the euphoric attractions of modernization - scholarly interest in styles of contemporary Muslim learning in North Africa. For Dale, Berque’s iconoclastic scholarly tastes enabled an historically informed approach to the study of religious education in North Africa. When the world was clamoring for new knowledge on such topics in the wake of the Iranian revolution of 1979, Dale was able to map that uncharted space with nuance, clarity, and contrast - the stuff of great scholarship. In his obituary for Berque, Dale took further inspiration from the French scholar’s efforts “to break down the barriers to international scholarly communication” (Eickelman 1995: 150). It is hoped that the present volume, which includes contributions from Pakistan, Morocco, Israel, France, Bulgaria, the United Kingdom, the United Arab Emirates, and the United States, serves as a fitting tribute to Dale and to his own commitment to global scholarly communion.

Eickelman combined Jack Goody and Benedict Anderson’s groundbreaking theoretical paradigms with the linguistic facility and bibliophilia of the major Orientalists. He then wrapped this new synthesis in Geertz’s ethnographic focus and ambition to produce one of the most influential bodies of work in Middle Eastern and Islamic studies, as well as in his core discipline of anthropology - and he is by no means done yet. By concerning himself not only with Islamic texts, but with the economy and social life of their production, Dale helped establish a method for the anthropological study of Islamic societies. The study of Muslim societies demanded this kind of social science - in the postcolonial era, the Islamic world could not remain the exclusive domain of philologists and linguists. But social science, and anthropology in particular, needed Islam, too - Dale’s work continues to call attention to the fact that the symbols, rituals and social practices of a significant proportion of the nonWestern world are tied inextricably to a moment of scriptural revelation. That relationship between scriptural proof text and everyday culture was described famously by Talal Asad as a discursive tradition. Dale’s later work demonstrates how changes in the technologies of communication and the structures of religious authority in Muslim societies altered the parameters of this discursive tradition, leading to changes in the very meaning and understanding of Islam itself.

In his concluding remarks from Knowledge and Power, Dale (Eickelman 1985: 168) anticipated some of these transformations:

The carriers of religious knowledge will increasingly be anyone who can claim a strong Islamic commitment, as is the case among many of the educated urban youth. Freed from mnemonic domination, religious knowledge can be delineated and interpreted in a more abstract and flexible fashion. A long apprenticeship under an established man of learning is no longer a necessary prerequisite to legitimizing one's own religious knowledge. Printed and mimeographed tracts and the clandestine dissemination of 'lessons' on cassettes have begun to replace the mosque as the center for disseminating visions of Islam that challenge those offered by the state.

The fragmentation of Muslim religious authority (Eickelman and Piscato-ri 1996), augmented by the incursions of new media (Eickelman and Anderson 2003), have produced myriad new expressions of Muslim religiosity. From American female imams to aspiring jihadist caliphs, Dale has given us a framework for making coherent sense of these changes. His contributions to anthropology, Middle Eastern and Islamic studies, and the broader humanities and social sciences are recognized by a diverse and eclectic group of scholars within those disciplines. If there is one thing about which the wide spectrum of opinion in those associated fields can agree, it is the excellence of Dale, and the worthiness of his legacy.

** Introduction: Dale Eickelman on Knowledge, Authority and Change

Allen James Fromherz

For this book to be worthwhile, it is not necessary in my view that it should be assumed to embody the truth for years to come and with regard to the tiniest details. I shall be satisfied if it is credited with the modest achievement of having left a difficult problem in a rather less unsatisfactory state than it was before.

Levi Strauss 1964

Dale Eickelman (1976) quotes this challenge from Claude Levi-Strauss in his early, groundbreaking book, Moroccan Islam, Tradition and Society in a Pilgrimage Center. He not only provides a portrait of an important pilgrimage site in Morocco but also leaves the understanding of religion, knowledge, power, truth and change in a less unsatisfactory state than it was before. Eickelman (1976: xviii) presents a new “vision of the nature of social anthropology and its relation with history.” In doing so, he breaks down the old divisions and assumptions about the difference between popular and orthodox expressions of religion. This sweet and sour baking of categories, especially those previously considered incompatible, is a feature of Eickelman’s later work as well. Instead of focusing on one wavelength or another, he examines the spectrum. His work shows what many assume to be opposite is often complimentary; what has long seemed the same may, in fact, be more radically different than imagined. Eickelman’s method provides a set of tools for questions of meaning that may, at first, seem ambitious, questions such as what is Islam?

It is not surprising that the late Shahab Ahmed (2015: 8) in his work, What is Islam? quoted Eickelman (1987: 18) in the first pages: “the main challenge for the study of Islam is to describe how its universalistic or abstract principles have been realized in various historical and social contexts without representing Islam as a seamless essence on the one hand or as plastic congeries of beliefs and practices on the other.” In addressing such challenges on a broad scale, Dale Eickelman joins Claude Levi-Strauss and other major names in anthropology, such as Clifford Geertz, who called for “thicker” thinking about larger problems with relevance beyond the field. Eickelman looks up from field notes and footnotes, breaches the walls of discipline and clarifies not only the big issues faced by anthropologists of the Middle East and North Africa, but also broader discourse about the nature of religion, authority and social change. In short, his work causes scholars and non-scholars alike to think different, to reach beyond established categories and assumptions,

creating ripple effects into the far beyond the tributaries of Middle East and North African anthropology.

The challenge of describing and commemorating the career and impact of an anthropologist is similar to the challenge of anthropology itself. While it would be easy to get caught up in fascinating minutiae or incremental advances, his bibliography is impressively varied and wide ranging. It could be the subject of its own study on the nature of academic networks and exchange. Eickelman did not limit himself to Morocco. He knew it would be necessary to move around, to compare, to hold a mirror up to multiple examples and manifestations. As Islam Observed (Geertz 1971), which compares Islamic societies in Indonesia and Morocco showed, a description may be “thick,” but it won’t completely “stick” unless there is something or some variant reference to which it can be stuck. In this respect, Eickelman (2005) has certainly continued the footsteps of Geertz, who was his professor at the University of Chicago.

In an early article on Musaylima, Eickelman (1967) not only engaged the latest scholarship, he also posits important questions and observations of the social anthropology of seventh-century Arabia. In his later works, Eickel-man’s keen collaboration and community building within the academy stands out. Although he wrote the influential textbook, The Middle East and Central Asia: An Anthropological Approach as a single author, Eickelman also regularly teamed up with a large number of scholars, providing that rare combination of a book accessible to undergraduates but also on the vanguard of the discipline. On their own, his writings would be evidence enough of his collaborative tendencies, of his ability to apply his ideas to a larger world even as he describes how ideas interact in real world contexts.

Clifford Geertz uses Eickelman as an exemplar of modern ethnography, “ethnographers have a clearer understanding [now] of what they must do if they are to comprehend people different from themselves - start a conversation and maintain one” (Geertz 1985: 11). Eickelman has followed this method in the field. His conversations, however, go beyond the confines of ethnography. He has also started and maintained conversations outside of purely academic pursuits. His bridge building is not confined to written scholarship. His leadership as President of the Tangier American Legation Institute for Moroccan Studies (talim), and his work with the American University in Kuwait (auk), and other organizations has improved education and cultural understanding from Pakistan to Morocco. Eickelman has reached beyond the library and the academic conference circuit; he converses with the public sphere.

It would take much more than a chapter to adequately summarize Eickel-man’s contributions both inside and outside of the academy. Our goal, however, must be a more modest achievement. While a bibliography of his works is included in this book, we cannot consider the entire corpus, let alone the entire matrix of connections that emerged from

Eickelman’s work. Instead, the chapters in this book represent only a portion of his wide-ranging impacts. To commemorate Dale Eickelman’s far-reaching impact, this volume shows not simply examples of his contributions to the acquisition of tiniest details. The chapters reveal how Eickelman’s scholarship as a versatile, intellectual toolbox, useful for thinking about the nature of knowledge, authority and change in a variety of contexts.

*** 1. Knowledge

In his book Knowledge and Power in Morocco: The Education of a TwentiethCentury Notable, Eickelman (1985a) shows that power is knowledge. His discussion and analysis of the social networks surrounding the rural nobleman and qadi, Hajj ‘Abd ar-Rahman al-Mansuri, made this far from the usual biography. Instead, he uses the life of this man to make important observations about the nature of knowledge and power more broadly.

It is both engaging and scholarly. For example, Eickelman (1985a: 21) provides an intriguing anecdote about the way he gathered information for the book, a story that says as much about the social architecture of power (and an awareness of his own role as an outsider) as any specific legal ruling.

In Boujad, the qadi decided I must sit with him and his clerk, since I could not sit with the litigants. I always moved my chair to the edge of the table to indicate that I was not a part of the proceedings. Nonetheless, some tribesmen unfamiliar with court procedures recognized me as a foreigner and sometimes saluted.

He goes on to describe the role of the bailiff, the court clerks and the judge, even suggesting that some in the court may have assumed Eickelman (1985a: 21), was yet another clerk or secretary of the rural Islamic court.

North African, rabbinical courts bear surprising parallels and distinctions, but also serve as important symbolic bearers of the social networks that create knowledge and authority. Connecting his own work on the Eickelman’s experience in Boujad, Harvey Goldberg’s engaging chapter, “An Anthropologist’s ‘Day in Rabbinical Court’ in late Ottoman Tripoli” is the first in this volume. The meaningful parallels between Goldberg’s research on a Jewish court in the metropolitan center of Tripoli, Libya, and Eickelman’s work in a Muslim court in rural Morocco, show the social basis for knowledge as power as similar across multiple religious and geographical categories. Even though Goldberg was unable to meet his subject, Mordecai Hacohen (d. 1929) personally, his chapter demonstrates the social and familial networks that continued to make Mordecai a locus of knowledge and power, even after his death. The message here is striking. The social power of knowledge is one of the few that can actually increase, and emerge unexpectedly, long after the end of life.

Education, the production and reproduction of knowledge as a means of instilling students with degrees of social power, is explored in “Islamic Education in Eighteenth and Early Nineteenth Century India” by Muhammad Qasim Zaman. His essay provides insights into the madrasa tradition in late Mughal and early colonial South Asia. Synthesizing moral philosophy with an anthropology of Islam pioneered in part by Eickelman, Zaman treats the madrasa not as a physical institution but as a set of practices, norms, and expectations that collectively constitute an educational tradition. Zaman surveys some of the harmonies and tensions that he discerns in the tradition of madrasa education as it adapts to changing circumstances. He provides textured sociological profiles of the teacher-scholars who embodied the madrasa tradition and describes the competing social and political networks shaping of the curricula that they taught.

Knowledge and power are also expressed and transmitted within the field of anthropology itself. Moundib’s comparison of the early works of two great anthropologists of Islam, Geertz and Eickelman, anchors our volume in important ways. Moundib’s close reading of Eickelman and Geertz demonstrates the broad methodological concordance of these post-structuralist scholars with respect to their reading of Moroccan social formations.

Seeing is not the same as knowing, or is it? Is a preference for evidentiary, “scientific” notions of knowledge an expression of power and dominance over sincerely (or even insincerely) held belief in the jinn? This is the compelling question behind the Simon O’Meara chapter, “Out of Sight in Morocco, or How to See Jinn in Museums?” The questions posed by Simon are both serious and compelling; they challenge anthropology and anthropologists in general to revise the usual presumptions of their fieldnotes, to engage with the jinn, even if unseen, as the only way to understand significance, their power to make the museum more than an objectification of culture.

*** 2. Authority

President of the Middle East Studies Association (mesa), in 1991 Eickelman gave an address about the changing nature of frontiers, state authority and the nation-state. Traditional notions of the frontier were “obsolete” (Eickelman 1991). Eickelman noted very early, the importance of “mass higher education” and “mass communication” well before the rise of Al-Jazeera on the religious imagination and the so-called Arab Spring.[1] Eickelman’s call for studies on the “academic frontier,” for new work on transnational mass communication, media and their influence on religion and identities beyond the traditional ambit of “area studies” was well received. The innovative studies of this section prove that Middle East studies has, indeed, been transformed. The challenge remains to explain why major, structural changes in the Middle East over the past decades have not, except in Tunisia, have not led to the “irreversible democratization” that Eickelman optimistically predicted in his address. Instead, the forces he points to have been even more disruptive than could have been imagined in 1991. They have been turbulent to such an extent that democratic

institutions are under strain throughout the world, including the West. The fragmentation of identities and traditional authorities and the rise of extreme thinking and polarization online and in the media means we must reconsider assumptions about the public sphere. In Muslim Politics, Eickelman and James Piscatori (2004) clarified the impact of recent changes in the Muslim world, showing how being Muslim has been transformed. The blurring of tradition and modernity, the rise of Muslim communities in the West, the fragmentation of political authority and the changing role of women have all overturned answers to Ahmed's (2015) question of "What is Islam?" But, changes in Muslim politics and society have also led to questions outside the strictly religious ambit, such as what is freedom?

In "Rethinking New Media in the Public Sphere: Beyond the Freedom Paradox," Jon Anderson builds on his pioneering collaboration with Dale Eickel-man in New Media in the Muslim World (Eickelman and Anderson 2003) to ask new and probing questions about the transformative influence of the Internet on social group formation and interaction. Anderson synthesizes important Susan Slyomovics, in her chapter "New Moroccan Publics, Prisons, Cemeteries and Human Remains," also reconsiders the public sphere and challenges to authority. In her interviews of political prisoners from 1999-2000, Dr. Slyomovics described the legacy and impact of the "Years of Lead." The post-Hassan ii (d. 1999) era has allowed for the creation of "New Publics" and a reckoning with the past. Focusing on the human body of dissidents, not the Internet or the media, as a means of communicating public resistance Slyomovics shows how the Moroccan state has dealt with its recent past.

El-Sayed el-Aswad in "Rethinking Knowledge and Power Hierarchy in the Muslim World," surveys Eickelman's pioneering contributions to a range of subfields within the anthropology of Islam, Middle Eastern and Islamic studies, and the broader social sciences. New media, politics, education, and religious change comprise Eickelman's expansive oeuvre, el-Aswad explains. Uniting these diverse interests is Dale's concern for knowledge. In particular, there is his examination of the way knowledge is produced and contested in Muslim societies. Historical and political context shapes these contests differently in different circumstances. El-Sayed el-Aswad's valuable survey underscores the breadth of Dale's scholarly curiosity and reinventive spirit.

Simeon Evstatiev's chapter "Salafism as a Contested Concept" shows the diverse meanings of modern, transnational Salafism. Using methods of analysis laid out by Eickelman, he questions whether Salafism should be seen as a product of encounter with the "West," as part of the deconstruction of modern frontiers, or part of a process of "historical origins." Evstatiev encourages a reconsideration of Salafism as a "contested concept," showing that "who gets the past" in Salafism is loaded with meaning and variation. Deftly examining the diversity of Salafi thought, Evstatiev shows that while Salafism attempts to show an immobile continuity with the earliest period of Islamic history, it too has, in fact, been subject to change and context when in "popular use."

Eickelman is expert at asking simple but profound questions that get to the heart of academic debates. In “Who Gets the Past?,” for example, Eickelman (2015) shows that Islamic authority and religious knowledge are subject to changes in information media, the transmission of knowledge and the rise of new public spheres. This emphasis on change in Islamic societies extends not only to the present but also to concepts of the past. Despite persistent problems facing many Middle Eastern societies, the dream of a renaissance of past glories remains.

*** 3. Change

There are few more striking examples of the impact of change in Islamic societies than Oman since 1970, the year of the accession of Sultan Qaboos bin Said al-Bu Saidi and the beginning of the “Nahda” or Omani Renaissance. While other Gulf states, such as Qatar, have similarly changed in visibly dramatic ways, none has had the social depth, diversity and population density of Oman (Fromherz 2017). Eickelman’s scholarship on Oman, both before and after 1970 was on the frontier, they (Christine Eickelman 1993; Dale Eickelman 1985b) questioned the ingrained assumptions about this once-isolated country, making it a case study of change in modern Islam. In addressing change in Islamic societies, Dale Eickelman challenges the assumptions of modernization theory, which suggests the decline of religion and religious influence. Instead of being marginalized by modernity, religious traditions, even as they are capable of change, “coexist and shape the experience of modernity” (Eickelman 2000). Disagreeing with clash of civilizations arguments, he suggests religion and culture are not a stark alternative or an immobile independent variable. Eickelman (2016) similarly contests other supposedly static categories of Gulf society. “Tribes” and “tribal” identity in the Gulf are not necessarily a stumbling block in modernization theory.

Mandana Limbert examines the role of religious tradition and change in “Religiosity, Men of Learning and Oil Wealth in the Land of the Imamate.” She points out that in 1978-1979, when Eickelman first visited the sultanate, Qa-boos bin Said al-Bu Saidi bin Said al Bu-Saidi had only been in power for eight to nine years. Limbert moves us forward forty years to 2018 and the changes experienced in the Omani town of Hamra, but also the resonances with the challenges witnessed by Eickelman. She shows how Eickelman influenced anthropologists to reconsider religion as an adjective, not a noun.

Jenny White’s contribution, “The Unbearable Lightness of Being Turkish,” also shows how change, in particular language reform in the past, has had a major impact on the meaning of Islam in Turkey, skewing it towards “popular understandings” of the faith. More recent including government embrace of a homogenized idea of Islam and the influence of extremist groups have pushed these same popular manifestations in other directions as Turks in various ways try to appear as “good Muslims.”

In “The Radicalization of Islam in Germany” Gilles Kepel suggests that Islamism is less distinct in Germany than it is in France, as was initially assumed. There is a need for refreshing our approach to the rise of Islamist militancy in Europe to deal with the challenges it poses. The radicalization of Islam in Europe, as troubling as it may be, is a classic example of Dale’s notion of religiosity being as important, if not more important, than supposedly static ideas about the supernatural.

Muhammad Khalid Masud shows us the flip side of radicalization in “Ma-drasas Promoting Social Harmony? Debates Over the Role of Madrasa Education in Pakistan.” Again, Eickelman’s notions of religiosity over religion, as a taught, cultural process, not a set identity or set of distinct beliefs, means that education can be a way out of extremism.

Eickelman’s oeuvre, as shown by the bibliography at the end of this volume, demonstrates an astonishing range and mastery of multiple subjects across many fields, areas and geographical zones. His books are single authored and co-authored, texts for advanced students and more specialized monographs. He has explored Islam and gender, education, the media and the public good. From Russia to Central Asia, Oman, Morocco and China, his scholarship spans the global frontiers of the Islamicate world. Social, economic and political studies of the Middle East, the very Brill series in which this book appears, although he was never made aware of this particular volume in his honor, shows his skill as editor and builder of academic communities and the breadth and depth of his expertise. As the chapters of this volume testify, Eickelman’s scholarship has been influential on generations of scholars in multiple continents, encouraging new ways of thinking about knowledge, authority and change.

Yet, Eickelman’s impact goes beyond his scholarship. While many of us who are paid to think, teach and write, focus on understanding what something “is,” there is similarly, whether we can avoid it or not, something important about doing, not just thinking. What something “does” and how that “doing” impacts lives. Dale shows how an academic can be at once a thinker and a doer. His contribution is more profound than simply being on an academic vanguard of certain intellectual trends. Eickelman’s work as president of Tangier American Legation (talim) and as human relations and relationship coordinator/ director of the Dartmouth-American University of Kuwait (auk) Program, for instance, not improves mutual understanding between peoples. He locates culture out in the open, not in locked boxes, lids closely shut with the key held by the elite, but in a vast diversity of communities, connections, and conditions. Thus, Dale Eickelman doesn’t just study communities in new ways. He helps create and sustain them.

Eickelman inspires academics to rethink what it means to be a scholar. We face the hollowing out of tenure, the rise of adjunct labor models, the decline of humanities and social sciences, the slow rooting out of faculty governance, the imposition of corporate-consultant profit models. For some, it is a journey into the empty quarter of the mind, a space where responses are few, mirages are many and harsh chance, as much as effort or

ability, prevails. By avoiding elitism, by welcoming many into his camp who would otherwise not think to speak with one another, Eickelman leads his intellectual companions to meeting places where conversations of meaning can occur. Moreover, nonacademics are invited to his majlis and to drink at the well. Through his mentoring, his persistent humor and kindness, Eickelman has worked to create a community of his own, a community with many branches in many parts of the world and many ways of experiencing the world. Dale Eickelman's first instinct is not to exclude or embargo or define others, or himself, in discrete categories, but rather to bring as many into conversations of meaning as possible. Eickelman starts and maintains discourse even at times and in places where silence prevails. He makes the understanding of what it means to be human not only more possible but also more enjoyable.

* Part 1: Knowledge

** 1. An Anthropologist’s “Day in (Rabbinical) Court” in Late Ottoman Tripoli

Harvey E. Goldberg

In the preface to Dale Eickelman’s Knowledge and Power in Morocco, Clifford Geertz points to several ways in which the book advances anthropological research.{1} The study offers a new “sense of what description and explanation amount to in anthropology” (Eickelman 1985: xii), epitomized by the image of “a young scholar and an indigenous scholar, thirty years his senior, bent over such manuscripts, admiring calligraphy, hunting for traces of economic dependencies, [or] reading between the lines of political gossip” (Eickelman 1985: xii). When I encountered this book, it became a significant reference point for me, because several years before I was deeply engaged in the manuscript of a scholar from the other end of the Maghrib, Mordecai Hacohen of Tripoli (1856-1929).[2] This, however, did not entail interpersonal contact. Haco-hen died ten years before I was born. What brought me to begin to explore his work in detail in 1968 was that his scholarship had an anthropological side to it. A significant portion of its five hundred plus Hebrew pages describes the lives of Jews in the hinterland of Tripoli, most of whom migrated to Israel between 1949 and 1951, and some of whom had been the subject of my doctoral fieldwork in 1963-1965 (Goldberg 1972, 2015-2016: 8-33). As I delved into the manuscript, learned more about its context, and for a few years encountered several of Hacohen’s children, my relationship with him - by then both intellectual and personal - deepened. This process continues today, and the current chapter has a dual purpose. One is to explore an aspect of Hacohen’s work from which I previously have kept a distance: his involvement with the rabbinic court in Tripoli at the end of the Ottoman period. The second is, aided by juxtaposing my encounter with Hacohen’s book to Dale’s experience with Qadi ‘Abd ar-

Rahman, to reflect upon the challenges and unexpected outcomes faced by an anthropologist assuming a task usually carried out by historians.

Comparing the experience of a fieldworker engaged with a living scholar to plumbing an unpublished text whose author is deceased requires a conceptual leap, so I offer two scenes from Knowledge and Power in Morocco that reinforced this act of imagination. When Dale began to attend weekly sessions of the Islamic court in Boujad, the qadi decided that he should sit near him and his clerk, rather than with the litigants. Dale followed suit, but when entering that situation concretely, moved his “chair to the edge of the table to indicate that I was not part of the proceedings” (Eickelman 1985: 21). Upon reading this, I was reminded of Hacohen’s describing a situation in Tripoli from the midnineteenth century. Under renewed Ottoman rule that began in Tripoli in 1835, steps were taken to establish a court that could accommodate Muslims, Christians, and Jews. In the 1840s, the head of the Jewish community - Rabbi Ya‘a-kov Mimun - was assigned a seat in the court but it was placed to one side and was not decorated (Goldberg 1990: 41; Ha-Cohen 1978: 148). The two historical situations were quite different, while the messages conveyed by the placement of seats in a courtroom still bore a “family resemblance.”

A second associative image arose upon reading that Dale and the qadi “began to regard one another as colleagues because of our work on a common project” (Eickelman 1985: 30). In the next sentence, Dale refers to ‘Abd ar-Rahman’s “own ethnographic efforts.” In my translation of Hacohen’s descriptions of Jews in the hinterland towns, I stressed the closeness of Hacohen’s perspective to anthropology (Hakohen 1993: 18). This was questioned, in a review, by a colleague (Rosen 1982: 628-29). I do not insist upon an anachronistic category, but am comfortable viewing Hacohen as an “ethnographer.” Like the qadi, Hacohen’s interests were far broader than one might guess from any official title. Over the years, and after many revisits to his text, my appreciation of his insights continue to grow, parallel to my expanded grasp of Hacohen’s context and a growing sensitivity to the specificity of the words he chose. In the present chapter, after introducing Mordecai Hacohen and the background to his book, I illustrate that enhanced appreciation by closely following his depiction of the rabbinic court - beit din - in Tripoli. The essay then concludes with further reflections on this anthropological excursion into the territory of textual scrutiny.

Mordecai Hacohen was born in Tripoli in 1856 to a family of Italian origin, and died in Benghazi in 1929 (Goldberg 2004: 1-30, especially n.45; Hakohen 1993: 3-4, 36-39). His father, a merchant, had died in a shipwreck off Crete, and the family became impoverished, while still holding Italian nationality. Mordecai grew up speaking Italian at home, and read and wrote it to some degree, though without formal training. No private tutor taught him Italian at home as might have been the case had his father lived. His Hebrew-religious education was in a traditional framework in the synagogue. Learning quickly, he earned a pittance there by assisting the rabbi in instructing younger pupils. In that setting he also learned to use the Hebrew alphabet to write the local Judeo-Arabic. Hacohen had some systematic knowledge of formal Arabic, undoubtedly as an autodidact, while I am unable to assess its extent or depth.

Mordecai supported himself in a variety of ways. He learned to fix watches and for a while was a merchant trading between Tripoli and communities in the Jebel Nefusa. At one point he taught in the school set up by the Alliance Israelite Universelle in Tripoli. From about 1904, he began to contribute articles to haskala (Enlightenment)-oriented Hebrew newspapers in Europe and also in Ottoman Palestine. Somewhat earlier, as will be discussed below, he delved into the world of rabbinic learning and acted as a representative of plaintiffs in the beit din. In 1920 he moved to Benghazi when the community invited him to serve as a judge in the beit din there.

Close to the turn of the century he began to work on his book (see note 1 above), finishing the final part some time after the Italian occupation in 1911. It is written in Hebrew in a script popularly called “Rashi script,” legible to people with a traditional Hebraic education anywhere, and is a mine of information on Jewish life in Libya placed on a background of a general description of the country and its history. He entitled the work Higgid Mordecai (Mordecai Narrated) and it reflected a range of research activities. Hacohen copied extant Hebrew manuscripts from the late eighteenth century, interviewed old people about past times, explored cemeteries looking for inscriptions, provided wordlists of a local Jewish argot, described political and cultural events of his own day, extracted discussions of local customs from the books of rabbis active in Tripoli, and devoted a section to the Jews in small towns in the Tripolitanian countryside. The full manuscript reached the library of the growing Hebrew University in the mid-1940s (see below), while portions of it appeared in the world of scholarship earlier (Hakohen 1993: 29-31, and see more below). It was published in Jerusalem in its entirety only in 1978, stemming - as noted - from a convergence of ethnographic and historical interests. After describing and discussing the section of the book that focuses on the beit din, I will consider the “second life” of the manuscript from an anthropological perspective.

*** 1. Hacohen and the Beit Din in Tripoli

Section 86 of Higgid Mordecai (Ha-Cohen 1978: 255) cites six cases brought before the beit din in Tripoli at the end of the nineteenth century, with some linking discussions. Some cases appear in detail while others are depicted succinctly. Like in other topics he presents, Hacohen first provides historical background. He begins by mentioning the role of a Rabbi Shim'on Lavi in the sixteenth century, whose origin was in Spain, and who is seen as establishing Jewish communal life in Tripoli after a period when little or none existed (Huss 2000). At the end of the section he includes a liturgical memorial text recounting rabbinic communal leaders from that period to the present (Goldberg 1994: 280-81). These framing paragraphs indicate the importance Hacohen attached to rabbinic leadership in the life of the community, even while much of the section is critical of the judges in his time: their decisions that overlooked rabbinic sources, and their practical procedures and decisions.

My chapter consists of some direct translations from Section 86 along with summaries of other parts (particularly the specific cases), interlaced with discussions of specific points and themes. In some instances, discussion is moved forward by reference to Jessica Marglin's recent valuable study describing rabbinical courts in Morocco: both similarities and differences are helpful in probing Hacohen's text (Marglin 2016). For example, Marglin (2016: 32) states that ordinarily judgments were not written down, except at the request of one of the parties. All the cases in Hacohen's Section 86 are written judgments (in Hebrew), with the understanding that they would be delivered to the "winning" party with the aim of enforcing them. This does not constitute a "contradiction" in the accounts. Hacohen's selection may reflect high-profile cases, and also instances on which he can base his documented discussion. Another difference in the accounts is that Hacohen's description does not mention the role of a "notary public" - sofer, which Marglin (2016: 30-31) described in detail, while presumably there were individuals in Tripoli carrying out the activities entailed.[3] These comparisons are not a search for homogeneity; their purpose is to identify the significant parameters. What seems to be shared in both settings is the minor role (if any) of a communal depository of records.

With regard to my summaries, they adopt a style that takes for granted the accuracy of Hacohen's reporting. Beyond my appreciation of the precision of his descriptions, there are no other sources against which I might assess them. Aware of this caveat, I spare the reader frequent reminders that a certain event or development is "according to Hacohen's account." This does not mean that everything in the text is immediately clear. Some of the following footnotes point to uncertainties of meaning, possible alternative understandings of terms, or ambiguities. Other notes focus on details of cultural content that may be of interest to readers. With these guidelines in mind, I turn to an exposition of Section 86.

The second paragraph of Section 86 portrays the leadership of judges in the past. They (according to Ha-Cohen 1978: 255)

would guide the people along upright paths and would make just decisions in civil matters (bein ish u-vein re'ehu) in areas like damages entailing neighbors, estates, wills, gifts, commerce, and all monetary law; in addition: the sale of land and IOUs, and so forth - everything was done by the court. Also, [ritual] matters of what is forbidden or permitted, marriage and divorce procedures, levirate marriage and release from it, punishment for adultery, violation of the Sabbath, and so forth.

The order of the subjects is worth noting, particularly in light of Hacohen's description - to follow soon - of changes in the arenas over which the court had jurisdiction. The first topics fall into a category one could consider "civil law," and only after that - rounding out the list - does he mention topics that today would fit into rubrics like "religion" or "ritual." In his following paragraph, after summarizing how decisions regarding civil affairs were enforced, Haco-hen refers to these blatantly "religious" matters with the term shimtot. This reflects medieval theology that distinguishes between "rational" biblical

commandments (sikhliot), that prime facie are based on reason, and those based on the authority of God's revelation or "voice" - the stem Sh M ^c reflecting both "listening" and "obeying" (without necessarily understanding).

One rubric - partaking of both of these elements - appears in the "middle" of the list cited: "marriage and divorce." This entails both monetary commitments and issues defined by religious rules. This realm remained in the hands of religious authorities under the Ottoman reforms, a factor relevant to understanding Hacohen's subsequent description. In terms of Western "democratic" sensibilities, the latter part of the overall list is most immediately associated with "religion." Overall then, in Hacohen's opening account of the duties of the judges, civil matters head the list.

Another aspect of Hacohen's summary, appearing later in his following paragraph (cited above), is somewhat surprising but welcome to anthropologists. He mentions semi-formal mechanisms of social control, some of which do not stem from the content of rabbinic law (halakha) per se. Hacohen states that the ability of the rabbinic court to enforce judgments resides in the authority delegated to it by the Muslim regime. This includes the power to imprison or to inflict corporal punishment, while he does not provide details of what such punishments looked like. Added to that was "excommunication" - her-em - which, as in Jewish communities elsewhere, probably reflected halakhic principles and took on different degrees of severity. Less common, however, is his mention of spies or snoops within the community. Again, examples are not given for the earlier period, but I have heard accounts of religiously motivated snooping regarding the Italian period, for example to discover if the Sabbath is secretly being violated (Goldberg 2018). Another depiction, of the public shaming of a woman deemed as sexually wayward, is - as far as I know - rare ethno-historical documentation.

Abruptly, after this historical summary, Hacohen (1978: 255-56) presents a contrast with present times - the late nineteenth century under Ottoman rule.

This is not like the present situation, because the Ottoman government has delimited the jurisdiction of judges in some measure, and they cast the whole yoke from off their necks. They delimited themselves (my emphasis) sevenfold, for even in cases like a [divorced or widowed] woman claiming what is due from her marriage contract (ketubba) and support, matters which according to Ottoman law are under the jurisdiction of the heads of the millets - and government officials will enforce compliance to the rulings of the head of the millet - the judges drag their feet even in matters that are clear as day. They delay their judgment, going to and fro, and a claimant only gets a decision after a long and tiresome effort. A fortiori, this takes place regarding other claims where the Ottoman government did nothing to restrict judges from hearing litigants who [have made the choice to] turn to them of their own will.

The slowness of the judges were the circumstances by which they themselves swiftly disseminated lawlessness within the rank-and-file, to undermine accepted norms, devaluing other aspects of civil law.[4] The principles of [transmitting] estates were destroyed. Many women, who already received portions of their dowries while their father was alive, requested an inheritance along with their brothers according to non-rabbinic law, even if their father had died before the proclamation of the Ottoman constitution that provided equal rights - because sons and daughters inherit equally in all the lands of the Ottoman Empire.

In earlier times, judges would receive payment from the winning party upon providing it with a written judgment (against the opinion of Maran in the Shulhan Arukh),[5] but in 5673/1912 the community prohibited judges from accepting this payment.[6] Instead, they received a budget from the communal fund to meet their needs. Judges would write down a judgment without citing the paragraph on which they based their decision, and no one dared face them with the demand: “show me from where you made this judgment!,” or turned to a higher court. Such a thought never arose.

This description moves to the present period in which reforms emanating from Istanbul increasingly became a central factor. There is no detailed account of the stages within Tripoli itself, but Hacohen’s book includes a story, which - if it is historical - would reflect the first dozen years after the Ottoman reconquest of the city, and suggests initial moves whereby Jews and Christians are involved in the local court along with the Muslim majority (Goldberg 1990: 48).[7] Lisa Anderson’s account of general administrative reform in Tripoli, from the mid-nineteenth century onwards, suggests that the process had its ups and downs (Anderson 1986: 88-95), and parallel irregular movement probably characterized legal reform as well. Hacohen uses the Hebrew phrase nimusei Togarma to refer to the new Ottoman laws.[8] Later in that section he distinguishes between the nimus of the Mejelle (which he calls the ‘Muhammadan’ law), and the Kanun (which he calls the nimus of Togarma).8 Terminology aside, most pertinent to our discussion is Hacohen’s focus on the responses of the judges to the new formal framework, which he implicitly assumes was not the only possible path that they could have taken in the emerging politico-legal situation.

In the following paragraphs of Section 86, Hacohen (1978: 256-57) offers the reader an example of a written decision prepared in 1899. Like several other examples in the section, it concerns inheritance, in this case a dispute among brothers regarding their father’s estate. Before the document was signed by the three judges who heard the case, Mordecai intervened, citing a principle in the rabbinic codes that the judges were ignoring. He does not explain his connection to this case, while in other examples in the section his involvement in the cases is formal: he appears as a murshe - an attorney-like representative - for a plaintiff, and even as a plaintiff himself in one instance. In this first example, he does present the reader with the content of his debate with the judges over the contested decision.

This first description concludes by reinforcing Hacohen's general point about the slowness of the judicial process. The judges withdrew the (unsigned) written judgment and held on to it while suggesting that the claimants reach a compromise. It was only after "days and years" that the plaintiff (one brother against two others) became fed up and relinquished part of his claim. They had witnesses sign a document that recorded their oral agreement. After the conclusion of this incident, Hacohen presents another general description:

The learned scholars (talmidei hakhamim) of the previous generation studied the Talmud only, not books of general knowledge (haskala) and certainly not the books of the rabbinic decisors, which could enable them to encroach upon territory of the judges (^cadat ha-dayyanim).[9] [10] Mur-shim [pl. of murshe] in the court were appointed only from among the rank-and-file who would accept any decision pronounced by the judges. They could not at all raise questions about the decisions of the court, and the learned scholars did not have the ability to examine privately the literature of the decisors.[11]

This brief paragraph raises a range of questions. It is clear that the extensive world of rabbinic learning is broader than the literature within it presented in condensed and organized legal precepts, which at times emerged in response to specific questions directed to rabbis. But a stark statement setting apart the two realms in such a formal manner is rare. Hacohen's account suggests one explanation: protecting the group of judges so that other learned people could not encroach upon their domain and livelihood. But this may have been a norm more deeply rooted than that of protecting self-interest. From the same period a source from Jerba echoes a similar situation, along with a critique of it. Thus, "Rabbi Yosef Hacohen would complain about certain scholars who would spend the day studying Talmud alone, and do not study the corresponding directives of Al-fasi and Maimonides or Our Rabbenu Asher" (Khalfon Ha-Cohen 1905: 22b).[12]

Thus, there may have been an established norm of separating these realms in the eastern reaches of the Maghrib (Goldberg 1994: 290-91; Tsur 2007), but more information is required. Other background factors may be relevant as well. Historically, relatively small numbers of printed books were found in Tripoli (Goldberg 2018). An introduction to the work of a scholar active there at the turn of the nineteenth century - Avraham Khalfon (1741-1820) - indicates that much of his effort was devoted to copying manuscripts that reached him (Hirschberg 1981: 153-55, 179-83; Khalfon n.d.: 65). Beyond that, it is worth considering whether this division of scholarly rabbinic labor may correspond to Muslim patterns, where different roles are played by muftis and qadis (Ackerman-Lieberman 2013: 688-89). Hacohen's book attributes great importance to Khalfon; part of its historical section is copied from a chronicle he authored in Judeo-Arabic. This work was mostly lost; in fact, none of Khalfon's books were published during his lifetime.

Returning to Tripoli in Hacohen's day, the complete acceptance of the decisions of the court seems to depart from the pattern analyzed by Marglin in Morocco where "an informal system of appeal operated" (Marglin 2016: 31). A person could turn to another court within a city if one existed, or even elsewhere when not satisfied by a judgment. This may have been partially a "logistic" difference between the two regions rather than one of principle. There were several important centers of rabbinic culture in Morocco, while historically it might have been necessary for appeals from Tripoli to be directed to cities like Tunis or Jerusalem. In addition, as evident in Hacohen's cases discussed below, the Ottoman legal system was open to Jewish claimants. One of the inheritance cases he describes involved property owned by a Tripolitan Jew in Italy. Later, I note other "transnational" aspects of the rabbinic-legal situation in the city.

The cases described by Hacohen run from 1876 through 1900. Four out of six of them are issues of inheritance. They bring home his point that cases dragged out, and sometimes never were resolved. In one case, an estate included a building that eventually was abandoned and eventually torn down in 1912-1913 after the Italian conquest. Another recurring theme is the prominence of procedural challenges during this period of political and legal shifts, including the changing position of a murshe acting in the court.

Each of the six cases that Hacohen describes reflects a different aspect of rabbinic law, but a thread that runs through several incidents is the greater activity and initiative on the part of a murshe. His account suggests that a murshe partially paralleled the wakil depicted by Marglin (2016: 38) - an Arabic term she translates as representative. The Hebrew term murshe - literally "one who has been given permission" - is rooted in Talmudic literature, but what a mur-she was or was not empowered to do evolved historically (and in some cases might be translated "agent"). Section 86 of Higgid Mordecai captures a fluid point in the Jewish community of Tripoli, when the passivity of a murshe was changing. Hacohen himself appears as an "agent" in this development, in both the formal and the sociological senses of the term.

In the first case he presents (cited above), that provides the full wording of the judgment, Hacohen does not explain what led to his involvement. It seems that at this time (1899) he was a common presence within the arena of the court's activities, including functioning as a murshe. This, however, is not stated.

In the second case that Hacohen describes, he notes that 1883 was the first time a learned talmid hakham was chosen as a murshe by a plaintiff, and appeared before the court. It involved a childless man who bequeathed his house to the community, charging that it be turned into a synagogue. The rest of the estate should be used to run the synagogue, and to help the poor of the city. The judges confirmed the will, but other potential heirs challenged this decision, turning to a talmid hakham

to present their case. The latter cited a section of the Shulhan Arukh that deals with court matters, and argued that in a situation like this the law does not allow local judges to decide. They must turn to a court in another city. The murshe's suggestion was to send the case to a court in Jerusalem. This was rejected by the local judges who upheld the original will.

In three following cases, Hacohen explicitly appears as a murshe. In the second (the fourth out of the sixth cases), there is no information on the content of the dispute, but he states that then he began to study the laws of the Me-jelle, and appeared both in the Mejelle court and that of the Kanun.[13] He next mentions an incident - without stating explicitly in which court - where his opponent, another Jew, claimed that Hacohen should be disqualified from appearing before the judges because he is an Italian subject. The response of the head of the court (whom I assume was a Muslim), was to silence this objection, warning Hacohen's opponent not to be contentious (Ha-Cohen 1978: 260).[14]

In the third and fifth of the six cases, Hacohen's personal involvement is prominent. In the former, he indirectly had a personal stake (this is the case in which the abandoned house was demolished under the Italians): his wife was one of the heirs making a claim on the estate four years after having acquiesced to the initial disposition of property and chattel. Mordecai thereby had an interest in her receiving a portion which, in terms of the history of the institution, created a basis for assigning him as "representative." The next step was to convince the other relatives to appoint him as their murshe. With this authority, he challenged the court's earlier decision regarding the will, citing arguments from the decisor literature. Initially, the judges did not respond to his challenge, but after a while asked a rabbinical emissary from Jerusalem, who was spending time in Tripoli, to be an additional adjudicator in the case. The Jerusalem rabbi backed Hacohen's formal arguments but suggested to the local judges to reach a compromise with the plaintiffs. A partial compromise was reached, while - as indicated - other aspects of the claim remained unresolved up to the Italian period.

The fifth case is the most dramatic. Both in this case and the previous narrative of Mordecai - describing himself in the third person as "the murshe" - he stated how the judges' reaction to his arguments angered him. The incident begins with the death of rich man (whose holdings included property in Europe) in 1876, who had been married to two women (it is not stated whether because of death or divorce), with children from both of them. At the time, an elder son from the first marriage was appointed "executor" of the will, while some of the arrangements were later challenged in 1900 when the children of the second wife were grown and demanded what was due to them. Their case began by sending a letter to Hafez Pasha, the Ottoman governor from 1900 to 1903. The Pasha turned to the current head rabbi (Hakham Bashi), stating that the court must adjudicate these claims, and ordering the Hakahm Bashi, Yehuda Qimhi (d. 1902), to be present at the deliberations.[15]

The striking feature of this case are several procedural attempts to keep Mordecai from serving as a murshe. The plaintiffs asked him to represent them after the Pasha decided that their case should be heard, but the judges sought to dissuade him from appearing before them. Their claim was social rather than legal: that the brother, the defendant who initially was appointed as executor of the will, is highly respected and it would be inappropriate to challenge him in court.[16] Mordecai refuses the judges' request (citing a source in the decisor literature), explaining that he already received part of his payment. Another opinion, backing the judges, was proffered by the head of the court (av beit ha-din), named Haim Cohen, stating that Mordecai is related to him and the law restricts him from sitting in judgment regarding a relative. Mordecai rebuts this argument too, citing the Shulhan Arukh, and showing that this case does not fall under the rule that would disqualify the judge.

I am not aware of any kin connection between Haim Cohen and Mordecai that confirms this claim. According to one source, Haim Cohen (d. 1905) was born in Jerba and moved to Tripoli, living there many years. He authored at least seventeen books (mostly published in Leghorn and in Jerba), taught many students, and became the head of the court.[17] In providing a list of his books, Mordecai Hacohen places him under "Jews of Tripoli" (Ha-Cohen 1978: 271). Mordecai's family history differed; its origin was in Genoa about a century earlier (Ha-Cohen 1978: ii8n34; Hakohen 1993: 38-39),[18] while he probably assumed - in traditional terms - that his kohen ritual status links him to biblical Aaron. I surmise that the overriding reason for trying to dismiss Mordecai in the case was that by this time he had become a familiar thorn in the side of the court.

Regarding the case itself - some of the arguments are presented in detail - Mordecai does in fact vigorously challenge the esteemed executor and the documents he brought to court. At one point a judge intervened to defend the position of the respected defendant. Mordecai retorted immediately that it is not proper for judges to answer on behalf of one of the parties. The debate deepened and again a judge responded to a question Mordecai presented to the executor. At this point Mordecai became angry, turned to the head rabbi, and stated that he withdraws from this case because a judge is not supposed to answer on behalf of one of the parties. "Please tell the Pasha," he requests, that the judges do not know how to conduct a case properly.

This step unsettled the judges and tension grew. They themselves withdrew in turn saying that it was Mordecai who did not know the law. The socially prominent executor wrote a letter to the Pasha saying that the murshe was uncultured; it was he who caused the judges to be angry and that is why they withdrew. The Pasha in turn asked the head rabbi what happened and, according to Hacohen, the latter was angered when he learned the details. He agreed that a judge should not speak in place of one of the parties.

After that, the executor received a written decision from the judges and dispatched it to Istanbul with one of his sons. The officials there nullified this written judgment stating that nowhere in the laws of any religion may a judge speak on behalf of one of the parties. Eventually, a compromise was reached between the parties through the mediation of the head rabbi in Tripoli, but the hostility between the court and Mordecai continued. The judges drew up a document agreeing among themselves that Mordecai could not appear as a murshe anymore. Head Rabbi Qimhi, however, refused to confirm that document.

Turning to the last (sixth) brief account, it appears surprising in light of the information already presented, and therefore underlines how much of the context we do not know. His attempt to keep Mordecai out of the aforementioned case notwithstanding, Haim Cohen did not approve the attempt by other judges to prevent Mordecai from appearing as a murshe. In fact, he subsequently hired Mordecai to represent him. There was a complex arrangement between him and the community in Tripoli, providing him with long-term residence there. Haim Cohen lived in a house the community owned, while also making a loan to them. The house was a kind of collateral, while there also existed an element of rent paid by him. A dispute arose in which the community claimed payments owed them, and he turned to Mordecai as a murshe. The latter succeeded in getting a decision favorable to him.

Towards the end of the section Mordecai explains how he continued to function as a murshe, even when the court would not authorize him, by “selling” legal arguments to one of the parties while not appearing in court himself to present them. A brief statement in his introduction to Higgid Mordecai indicates that this provided him a comfortable income. I assume that his presence continued to irritate the court, and that his relationship to the organized community remained tense, but his abilities in the realm of rabbinic law were recognized. In 1920 he moved to Benghazi when he was appointed to the rabbinical court there.

*** 2 The Second Life of Higgid Mordecai

At this point I shift gears. Mordecai’s rich text brought me to explore the changing rabbinic-legal culture in Tripoli while leaving open significant questions. Were there others like him, trying to upgrade the standards of the rabbinic court while learning how to function in new legal arenas? Another question might be: what insights do we gain regarding the role of the Ottoman-appointed Hakham Bashi in Tripoli, and perhaps elsewhere, being asked to “keep an eye on the court” by the Pasha, without being an ultimate arbiter? Or which of these patterns continued into the Italian period? De Felice suggests that when, in 1913, a new legal order prescribed that “disputes between ‘indigenous’ Jews, relating to their civil status, family law, and inheritance could be submitted either to the rabbinical court or the Italian court, ... [the] measure was received favorably by the more modern Jews” (de Felice 1985: 37, 308n29). I do not have the tools to further explore these

questions, and neither is there a great deal of material available to supplement Higgid Mordecai.[19]

Instead, I turn to reflections upon my long-term engagement with Haco-hen's manuscript, running from his account of Jewish communities in the hinterland through his actions in court which at times had wide reverberations, that might have relevance for other anthropological forays into heavily-textualized arenas. The ensuing discussion thus deals with the "second life" of Higgid Mordecai, subsequent to Hacohen's last revisions of it in the second decade of the twentieth century.

The discussion may be framed as follows. What would be the nature of our knowledge, surrounding a rural qadi in Morocco on the one hand, or an intelligent and active, but maverick, talmid hakham in Libya on the other, without the anthropological input that serendipitously entered their life-stories?[20] In the case of Qadi 'Abd ar-Rahman, one part of the story has an obvious answer: - events entering the notes of anthropologist Eickelman that left no other record. Some of these events relate to Jews who lived in the region.

The appointment of 'Abd ar-Rahman to the position of qadi, in 1957, meant moving to a new town. According to Eickelman (1985: 121):

he was aware that an era had come to an end . [and] prepared a list of men of learning who had been entertained at his brother's house (who also was a learned notable) . from its construction . until Moroccan independence. The heading of the list specifies ulama wa-shurafa (scholars and descendants of the prophet), but only those shurafa who were also men of learning are included.

That list certainly would interest future historians as it was composed, but because of his personal contact with the qadi, Eickelman was able to add further context: "Jewish men of learning, like the French, were not (my emphasis) enumerated, although 'Abd ar-Rahman recalls that one of his elder brother's respected local friends was a rabbi . who visited him regularly." This direct rapportage upends simplistic distinctions between the tasks of historians and anthropologists.

Turning to the second part of this "what-if?" procedure, I now sketch several stages over six decades, at which scholars from outside of Libya were exposed to Hacohen's manuscript, in order to speculate why it was intervention by an anthropologist that finally brought the manuscript to its full publication. Some episodes partially have been discussed before, but I weave them together here into an account of anthropological input to the work of a traditional (and innovative) North African scholar. The occurrence of which we have the

fullest (but by no means complete) knowledge is Hacohen's meeting with Nahum Slouschz (1871-1966) in Tripoli.

Slouschz made several trips to North Africa. He reached Libya in 1906 (then under Ottoman rule), sent by the Alliance Israelite Universelle to report on the local aiu school and the situation of Jews there. In Tripoli, he was directed to Hacohen who was familiar with some of the smaller communities, and earlier had sent a report to the aiu on the Jews in the "remote" Jebel Nefusa.[21] Haco-hen agreed to be Slouschz's guide, taking several trips, including one to Cyre-naica (by boat). This "native guide," however, not only knew the territory but shared intellectual interests parallel to those that drove Slouschz. At the time, Hacohen was close to finishing his manuscript on the history, institutions, and customs of the Jews of Libya.

Slouschz asked Hacohen to keep a diary (in Hebrew) during their trip in Tripolitania, something that became clear only with the publication of Slous-chz's personal papers (Ha-Cohen 1969: 45-90). From these we can see how extensive was the knowledge gained by Slouschz from Hacohen, and there also are records of fourteen letters between them up through 1910 (Hakohen 1993: 23-24). In one letter, Slouschz asked for additional material to be sent, and in another the idea appeared of Hacohen's manuscript being published in Paris (I assume this meant published in translation, but the letter is not explicit). There is no further mention of this project, but another manuscript by Hacohen, corresponding to a portion of Higgid Mordecai, was given to the National Library and possibly was sent to Slouschz with publication in mind.[22]

Up to the late 1960s, the most widely-known account of the small communities in Libya was that published by Slouschz (1927).[23] As an anthropologist examining Slouschz's account in relation to that of Hacohen, I was struck by Slouschz's insertion of what he learned about "the Jebel" into an evolutionist perspective wherein societies are located on a conceptual ladder, and his application of this notion to Jewish history (Hakohen 1993: 25), while Hacohen, though he acknowledges being influenced by the trip together with Slouschz, eschews grand schemes. In the early report he sent to the aiu (see note 20), he remarks upon Jewish antiquities scattered throughout the Jebel Nefusa towards its conclusion. In Higgid Mordecai, he begins the section on the Nefusa with this information, but not in terms parallel to those proposed by Slouschz. The lasting value of Hacohen's description is his detailed ethnography.

Thus, Hacohen played a central role in Slouschz's becoming "the expert" on Libya within the expanding "republic of Hebrew letters" of which Slouschz was a known participant. Slouschz acknowledges Hacohen's assistance, but not to the extent that one would expect by today's conventions (Goldberg 2004: 1112). Might one speculate that Slouschz did not energetically push the plan for publishing Hacohen's manuscript because it might detract from the impact of his own efforts? We cannot uncover his motives, but my guess is that Slouschz's initial suggestion was genuine. As time passed, however, the link between the two men weakened,

allowing Slouschz, consciously or not, gradually to minimize Hacohen's role in his own accomplishments.

A second stage of outside attention to Hacohen's writings occurred as Italian control of Libya consolidated. Martino Mario Moreno, a scholar trained in Semitic languages, was assigned to Libya by the Ministry of the Colonies, and his duties included bringing knowledge of the local society to Italian readers. I imagine that, like other experts from abroad, he was directed to Hacohen, and also surmise that he welcomed discovering a book on the local Jewish community "ready-made," that only had to be translated from the Hebrew. The first product of this collaboration was published in Benghazi in 1924, and a second, slightly modified version, appeared later in Rome (Cohen n.d.). Relatively recently, Robert Attal (1993) acquired and published a copy of the contract signed between Moreno and Hacohen in Tripoli in 1915, indicating its terms. Moreno committed himself to come four hours a day to Hacohen's house, and to complete the work within a certain time limit. When the translation (plus material added for the envisioned readership) appeared, Moreno explained in the introduction that it is one segment of a larger work, and described Haco-hen as contributing to history, folklore, and ethnography. My hunch is that for Hacohen, this publication was acceptable closure of his efforts to bring Higgid Mordecai to a scholarly audience. Below, I add one more detail about Haco-hen's work with Moreno, but first turn to the stage whereby the manuscript first reached Jerusalem.

There was another copy of the manuscript. After Hacohen's death, one of his sons - Yehuda (Leone, in Italian) - was in charge of it. His children understandably wished to publish the full Hebrew work. An opportunity arose when Tripoli came under British control early in 1943. Within the Allied forces were Jewish volunteer soldiers from Mandate Palestine. Among the military chaplains assigned them was Ephraim Urbach (1912-1991), later to become professor of Talmud at the Hebrew University and also serve as president of Israel's National Academy of Sciences. In 2008, Urbach's diary kept during his military service was published; it mentions Yehuda Hacohen and the manuscript (bound like a book) in his possession (Urbach 2008: 184-85).

Yehuda approached Urbach who took the manuscript to examine it. The latter recorded this event, as well as an appointment he made to meet Yehuda and discuss his father's book. Urbach remarks in the diary that the book includes some odd (Hebrew: muzar) subjects, and also mentions a promise to write a brief description of it. There is no record of Urbach's writing anything, but he apparently persuaded Yehuda that the safest place for the future of the manuscript was the National Library in Jerusalem.[24]

Few scholars paid attention to the manuscript after it arrived. Eventually, it was examined closely by Haim Z. Hirschberg and one of his students (see below). The family owned another copy that remained in Tripoli, reaching Israel when Yehuda and several siblings arrived with the large immigration between 1949 and 1951. They also possessed a collection of their father's papers that they later gave to the National Library as well.[25] At a certain

point, librarians came to the family and took the materials that interested them, while leaving several cartons of papers deemed unimportant. I later saw these cartons when I first met the family (in the mid-1970s), specifically with Toni (Fortuna) Mosseiri, a younger sister who took charge of this literary estate after Yehuda died. Among the remaining papers were hand-written pages containing Hebrew and Italian; I believe they were working drafts of the joint project of Hacohen and Moreno. One might muse that had Hacohen been a major contemporary writer, or had lived centuries ago, librarians would have found value in these preliminary documents as well. Eventually Mosseiri donated them to the Porat Yosef Yeshiva, a prominent institution of Sephardic Jewry. While many factors were involved, it is possible to see a tendency towards peripheralization, both in Urbach's quick assessment of the book and also in the library's lack of interest in the broader context of Hacohen's work.

At this same period, the first stirrings were felt in Israel that more attention must be paid to the recent history and culture of Middle East Jewish communities. An important marker was Hirschberg's 1965 two-volume publication; he consulted and cited Higgid Mordecai (Ha-Cohen 1978) extensively. A few years later, in his contribution to the Encyclopaedia Judaica on "Libya," Hirsch-berg (1971) wrote, "most of the information in [Slouschz's] books about the eighteenth and nineteenth centuries stems from his guide, Mordecai Haco-hen, whose history based on earlier sources is still in manuscript." Hirschberg directed a 1969 M.A. thesis utilizing the manuscript in detail.[26] When I met its author - a student born in Libya - in the 1970s, he said that there had been discussion of his publishing Hacohen's manuscript but certain health considerations kept him from undertaking the task.

There also was a parallel initiative from another source, Rabbi Frija Zuaretz (1907-1993), a prominent leader of the Libyan Jewish community in Israel (Goldberg 1992), but for some reason that I did not explore, some misunderstandings between him and the Hacohen family kept the idea from moving forward. Zuaretz had no link to events early in the twentieth century, but my sense was that his standing in Israel tainted him with memories of the tension between Mordecai and the former community leadership, introducing an aura of suspicion into the attempted cooperation and eventually undermining it. When I broached the idea of publishing the part of the manuscript describing the hinterland communities (and an English translation) - concerning which I felt I had some scholarly competence - to Hirschberg and to Zuaretz, they each welcomed the idea. Further consultation with the Ben-Zvi Institute, the institution most likely to host such a project, led to their encouraging me to edit the full Hebrew manuscript. I agreed, and from then on worked in close cooperation with the institute, as well as with others who helped me with various parts of the text. The project came to completion in 1978.

Another, pragmatic, aspect of the undertaking awaited closure as well. It was felt that publishing the book required the assent of the Hacohen siblings. The Ben-Zvi Institute approached them - through Ms. Mosseiri - and they assented to the idea while also contributing to the publication costs. My conjecture is that their relationship with me that began on a personal basis, and also the more formal connection to the institute, were perceived as separate from the past troubled involvement with "the community." I believe

they felt that “finally,” their father’s book was not being ignored. At the end of an evening event taking place at the Ben-Zvi Institute after the book appeared, Ms. Mosseiri remarked to me that I could be considered her father’s grandson.

Summing up, was it just a “coincidence” that the end to this “ignorance,” which took various forms, was facilitated by an anthropologist, or, might the effort be seen as growing out of that discipline’s cold-and-warm alignment with historical and other expressions of textual-based investigation? The story of Slouschz’s relation to Hacohen is too complex to summarize in a phrase (Goldberg 2004), but it is obvious that he should have given Mordecai much more credit. Moreno’s writing about the book was respectful to Hacohen. In fact, I once asked Toni Mosseiri about her father’s close associates. She did not name other Jews, but did include Moreno among the three people she cited (Hakohen 1993: 13). In terms of the wider setting, the Italian publication appeared in a framework of getting to know the “others” in the North African colony.

There also is further irony to Urbach’s responsible but not too interested treatment of the manuscript. Slouschz’s writings were known to Urbach, not because of any special interest in North Africa, but because Slouschz belonged to a generation of people, some of whom were his friends from teenage years in Odessa, who made significant contributions to developing Hebrew culture (Goldberg 2004: 8). At one point during his assignment, Urbach traveled to the interior of Tripolitania using Slouschz as a guidebook to contemporary and earlier Jewish life there (Urbach 2008: 130-33). He had no inkling that the somewhat “odd” manuscript he encouraged Yehuda Hacohen to send to Jerusalem was an important source of Slouschz’s knowledge.

Why, then, do I think that anthropological input was an ingredient yielding Higgid Mordecai’s ultimate publication? I cannot neatly define a feature of anthropology analytically distinct from what historians do, but instead evoke a mixture of metaphors in seeking to specify what was at work. Accompanying all the phases of the sustained effort was my earlier intense fieldwork with actual people from Tripolitania. That experience constituted a kind of ethnographic yeast that kept expanding, implicitly pushing me to imbue Hacohen’s text with lived dimensions.

At the same time, the overall process cannot be understood without acknowledging a cautious readiness by textually-anchored scholars to receive an extra-disciplinary excursion into their realm. I, having become hooked via ethnography to Jews from Libya, perhaps became the “bait” that invited some researchers to look more closely at the unfamiliar but intriguing “creature” - Mordecai Hacohen - who had been circulating in their pond for some time.

Loose as these metaphors may be, I hope they persuade that anthropological input to publishing Higgid Mordecai, albeit elusive, was very real.

** 2. Islamic Education in Eighteenth and Early Nineteenth Century India

Muhammad Qasim Zaman

Focusing primarily on South Asia, this chapter seeks to briefly explore the question of what it means for the madrasa and Islamic learning in late medieval and early modern India to have existed as a tradition and to provide a glimpse of some of the practices that went into making and sustaining that tradition. I seek also to illustrate some of the ways in which wider intellectual trends interacted with local contexts in helping forge an intellectual tradition. Another question that informs this overview relates to the presence of rival trends within the realm of the madrasa and how they have competed for relative influence even as they have coexisted in various measures.

*** 1. Practices, Institutions, Traditions

From their beginnings in Khurasan in the tenth century, and their gradual spread in both eastern and western Islamic lands from the late eleventh century onwards, many a madrasa has brought both learning and distinction to its locale. The most famous of the early madrasas were the Nizamiyyas, founded in more than ten cities in Iran and Iraq under the patronage of the Seljuq vizier Nizam al-Mulk (d. 1092) (Arjomand 1999: 270). Later madrasas had their own claims to distinction. The Mustansiriyya, established by the Abbasid caliph al-Mustansir (r. 1226-1242) in Baghdad in 1234, was, for instance, the first to be endowed by a caliph and the first to have professorships in all four of the Sunni schools of law that had emerged as pre-eminent by that time (Hillenbrand 1960-2002. For an account of the founding of this madrasa, see Ibn al-Fuwati 1997: 80-86). Madrasas established in Iran in the age of the Il-Khanids (c. 12601335) and the Timurids (1370-1507) were often part of what have been characterized as “educational-charitable complexes” that included not only mosques but also Sufi convents and hospitals and, as such, represented a vast increase in scope and function over even the grandest of the earlier madrasas (Arjomand 1999:271-76, especially 272).

Yet, fundamentally, and for much of its history in many - though not all - Muslim societies, the madrasa is best understood not as the name of a particular kind of institutional structure dedicated to the transmission of learning but rather as a set of practices concerned with such transmission. In a seminal study of a prominent madrasa in early twentieth-century Marrakesh, Dale Eickelman (1985: 86) noted that the

Yusufiya had no sharply defined body of students or faculty, administration, entrance or course examinations, curriculum, or unified sources of funds. In fact, its former teachers related with amusement the frustrated efforts of French colonial officials to determine who its “responsible” leaders were and to treat it as a corporate entity analogous to a medieval European university.

Writing in 1910, Shibli Nu'mani (1934a: 102-3), a traditionally-educated religious scholar of colonial India who died in 1914, had characterized the difference between Western and Islamic styles of learning as follows:

An imposing building, a group of specialists in particular fields, a series of lectures, a limited number of hours (after which the building becomes lifeless) - these are the things that, in combination, constitute a university or a college. In earlier usage, however, a college meant the presence of a particular person. A college would come about wherever he happened to be located [literally: wherever he sat down]. A vast number of people would gather around him to benefit from him, and his grace (fayd) would pour forth on them all the time. Day or night, whatever he said was an academic lecture. His actions, his comportment, his mannerisms - all comprised practical but silent lectures. The chains of his students would continue to expand so that this living college soon became a great university.[27]

Though an idealized portrait, of course, Nu'mani's statement has the merit of drawing attention to the central role that the person of the scholar-teacher, rather than his institutional setting, had in the transmission of learning. This is not to say that madrasas had nothing to do with learning, only that they did not assume a necessarily, or primarily, institutional form.[28] The broader point to which Nu'mani alludes here is that the learning in question was part of a set of practices tha[[t th]]e professor was expected to embody and exemplify.[29] That learning itself comprised particular practices: these included training students in how to engage in what Khaled El-Rouayheb (2015: 97-128) characterized as a "deep reading" (mutala'a) of texts and of the relevant commentaries on them (cf. Wali Allah 1858: 3); teaching them how to resolve the difficulties posed by the material under study and to enter into debate and disputation about the problems they raised; having them acquire the skills for writing a gloss or a commentary on a text (Wali Allah 1858: 8); and so forth. In turn, those practices related to others that, as Nu'mani put it, were in the nature of practical but silent lectures. These could take the form of norms of comportment, of how one conducted oneself as an aspiring scholar. Other areas of intellectual, religious, spiritual, and social life were often part of the madrasa's universe, too, and some of these merit a brief comment here.

A key role was played in this regard by Sufism. In the foregoing passage, Nu'mani speaks of the master's grace pouring forth at all times on those around him. The specific word - fayd - he had used in this connection is an evocative Sufi term. According to the great Andalusian mystic Ibn al-'Arabi (d. 1240), "the way of gaining knowledge is divided between reflection (fikr) and bestowal (wahb), which is the divine effusion (fayd). The latter is the way of our companions" (Chittick 1989: 169, quoting Ibn al-'Arabi 1911: 1, 261). Yet, the two forms of acquiring knowledge were often part of the same set of practices, as the following examples should suggest. In an autobiographical essay, the noted eighteenth-century hadith scholar and Sufi Shah Wali Allah (d. 1762) of Delhi, on whom I will say more in what follows, has given us a brief but vivid account of his education, much of which he had received from his father. At age fifteen, he had been initiated into the Naqshbandi Sufi path by his father and, alongside works on Qur'anic exegesis, the reported teachings of the Prophet Muhammad

(hadith), law, theology, logic, and philosophy, he had studied a number of Naqshbandi and other Sufi texts (Husain 1912: 17172).[30] Tellingly, his reading of the Qur'an at this time was itself inflected with Sufi piety:

One of the great blessings [on me] was that I was present with [my father] on several occasions when the Qur'an was read by way of reflection on its meanings and on the occasions of its revelation, and with reference to its commentaries. This [opportunity] became the cause of a great opening [fath-i ^razim] forme.

husain 1912: 172

Wali Allah's Persian translation of the Qur'an is titled Fath al-Rahman - with fath bearing unmistakable connotations of a Sufi-inflected unveiling. He goes on to note that, following the completion of his education and the death of his father, he taught "religious (kutub-i diniyya) and rational books" for about twelve years and that "in those days of [mystical] opening, unity and expansiveness came to be accompanied by the experience of [divine] attraction and of progress along the Sufi path, with the mystical sciences (^culum wijdaniyya) descending [upon me] in droves" (Husain 1912: 173).

Wali Allah was not quite unusual in this regard, as another example from the generation following his should illustrate. Mulla 'Abd al-Ali (d. 1810), better known by his title, Bahr al-'Ulum - "the ocean of the sciences" - belonged to one of the most notable scholarly families of late Mughal and early colonial India, the Farangi Mahall of Lucknow. Over the course of a distinguished career, 'Abd al-'Ali wrote a learned book on core Islamic rituals (arkan) as well as commentaries and glosses on a number of philosophical, theological, and juristic works. He was devoted to the teachings of Ibn al-'Arabi and he wrote what became an influential commentary on the Masnavi of Rumi (d. 1273) in the light of Ibn al-'Arabi's teachings. Like Wali Allah, his scholarship and his career as a teacher were clearly shaped by his strong Sufi proclivities, which may also be assumed to have guided the scholarly practices he had sought to inculcate among his numerous students.[31]

Just as Sufi piety provided some of the context in which scholarly practices were pursued and inculcated, so did patronage. The case of 'Abd al-Ali Bahr al-'Ulum is again instructive in this regard. He had begun his career in Lucknow, which is where his extended family resided. His grandfather, Mulla Qutb al-din (d. 1691-92), had been murdered because of a local feud and the Mughal emperor Aurangzeb (r. 1658-1707) had given his family a mansion in Lucknow that had previously belonged to a European merchant. That is how the family had come to be known as the Farangi Mahallis - namely those associated with the "European's residence" ('Inayat Allah 1988: 43-55). 'Abd al-'Ali would have to leave his native Lucknow on account of his alleged involvement in a conflict with the locally dominant Shi'a. At a time when the Mughal empire was in chronic decline and quasi-independent

rulers governed their local principalities, he would find many patrons in succession, namely the ruler of Shahjahan-pur in what is now Uttar Pradesh; of Rampur, also in today's Uttar Pradesh; of Buhar, in Bengal; and of Carnatic, in south India. Significantly, the English, too, were among his patrons, for they seem to have had some role in getting him invited to Bengal (Hasani 1947-1970: vol. 7, 284). Some of his patrons are reported to have built madrasas for him, but he was a traveling madrasa in his own right. It is telling that he tended to proceed from one center of patronage to another with an entourage of students even as he attracted others to his presence; nearly a hundred students are said to have traveled with him when he moved to Bengal (Ansari 1881: 123).[32] He was the kind of person who best fitted Nu'ma-ni's characterization of the madrasa as the site where a distinguished scholar happened, at any given time, to be located.

Grand madrasas were built, too, though far less commonly in India than in some other Muslim societies.[33] Royal and other governmental patronage did not need to take the form exclusively of monumental structures, and it was no less substantial for taking other forms. Such patronage was also a form of practice, one intertwined with the many other practices that went into the making and sustaining of a religious and scholarly tradition. About the Mughal emperor Aurangzeb, it is reported, for instance, that he "assisted students, in proportion to their proficiency, with daily stipends, so that they might apply themselves [to their studies] with all their hearts. They say that the students of Mizan received one anna, of Munsha'ib [both elementary works in Arabic grammar] two annas, and up to Sharh-i wiqaya [a work on Hanafi law by 'Ubayd Allah b. Mas'ud al-Mahbubi, d. 1346] ... eight annas per diem. The eight annas allowance was continued until the student had attained complete proficiency. After this they were set apart to teach others and worship the Creator, and received a grant from the revenue of mu'afi [tax-exempt] villages and a daily allowance according to their needs" (Faiz Bakhsh 1888: 104-5; see also Kazim 1868: 108586; Khan 1927: 258. All these references are cited in Umar 1993: 261).

The relationship between educational practice and the enabling role of royal oversight and patronage is illustrated by an analogy provided by Wali Allah. Discussing the co-relation between legitimist claims to political authority and the actual assertion of political power with reference to the case of 'Ali (r. 656-661), the fourth of the Rashidun caliphs and the first imam in the Shi'i reckoning, Wali Allah gives the hypothetical example of a teacher appointed by a king to teach at a madrasa. Despite the king's command to the students to study with that teacher, for some reason or other, no teaching sessions actually take place. In this circumstance, observes Wali Allah, it could equally be said that there is a teacher in the madrasa but that people do not study with him or that there is no teacher in this madrasa since no teaching is in fact taking place there (Wali Allah 1976: vol. 1, 142-43). Wali Allah's example here is incidental to his point, which is that it is possible that someone might have all the attributes of legitimate rule and yet not be able to rule so that it could be said of him equally truly that he is or that he is not the ruler. His chosen example is nonetheless instructive for our purposes. It illustrates, on the one hand, how royal authority was recognized as creating some of the conditions in which educational practices took place. On the other hand, it suggests that even the presence of a teacher, let alone the existence of the madrasa as a physical entity, did not suffice for the pursuit of learning. It also required

certain kinds of practice, and those might or might not come about even if other things appeared to be at hand.

An anecdote from the recorded discourses (malfuzat) of Wali Allah's son, Shah 'Abd al-'Aziz (d. 1824), is worth considering, too, for the additional light that it sheds on the madrasa as the site of particular sets of practices.

A singer of devotional songs (qawwal) once came to 'Abd al-Aziz at his ma-drasa to request him to name his newborn daughter. Having suggested a name, 'Abd al-'Aziz asked him to perform the raga Dhanasari. The qawwal complied for a while and then suggested that he perform something different, such as some of 'Abd al-'Aziz's own Arabic poetry. The revered scholar, intent upon continuing to listen to the same raga, responded: "this is not a madrasa, such that it [the recitation] would need to be in Arabic; Hindi is perfectly good for the occasion" (Bashiruddin 1897: 65; for a slightly different translation, see Rizvi 2004: 77-78). What is remarkable about this report is, of course, that it was, indeed, a madrasa at which this performance was taking place. 'Abd al-'Aziz's point was nonetheless that it was only when people engaged in certain kinds of practice that the place became a madra-sa; otherwise, it was just a location, one where a classical Indian raga could be enjoyed without any sense of unease.

*** 2. The Transregional and the Local

As seen in the case of Bahr al-'Ulum, scholars were mobile, moving from one patron or locale to another. The relevance of this point extends beyond questions of patronage, however. It also has to do with the introduction of particular practices as well as of texts in particular regions. The introduction of a book into a particular locale might depend not on its intrinsic quality alone but also on its availability - on whether a scholar had it in his possession, whether he could make a credible claim to having been authorized by his teachers to teach it to others, whether it could be fitted into the local intellectual culture and aligned with the tastes of its audience. Works regarded as indispensable in one culture might well remain unheard of in another, just as many works would regularly continue to fall out of circulation. Some jurists specifically required that the texts on which a mufti relied to issue his fatwas ought to be in broad circulation for his legal pronouncements to be credible (Ibn al-Humam 1970: vol. 7, 256; cf. Wali Allah 1965: 35). Thus, a scholar who might, in one locale, have easily drawn on a well-recognized work would be unable to invoke it in his fatwas in another, where it might simply be unavailable. They could always be introduced by him there, of course, but it is unlikely that they would acquire sufficient currency rapidly enough for him to base his juristic responsa on them. Being in possession of a chain of transmission through which one claimed to have acquired the right to teach and transmit a text was likewise an acceptable way of putting it to use (Ibn al-Humam 1970: vol. 7, 256; Wali Allah 1965: 35), but even this may have worked better with, say, hadith reports than with large works of substantive law in a milieu where they were previously unknown.[34]

Mahmud b. Ahmad al-Bukhari (d. 1219), a Central Asian jurist of the Hana-fi school of law, had noted in the preface to his Muhit al-Burhani - a major compendium of Hanafi law - that the legal writings of his ancestors were all in circulation, that they were relied upon by judges and muftis, and that he had compiled his Muhit in order to join their scholarly company (al-Bukhari 2003: vol. 1, 22-23). Ironically, however, the Muhit itself fell out of circulation, and some scholars - notably the Egyptian Hanafi jurist Ibn Nujaym (d. 1563) - disallowed fatwas with reference to it (Ibn Nujaym 1998: 291). Muhammad ‘Abd al-Hayy (d. 1886), the pre-eminent Farangi Mahall scholar of the late nineteenth century, notes that, like some others before him, he had assumed the disallowing of fatwas on the basis of the Muhit to have been a function of the book’s poor quality. But, having chanced upon a copy of the manuscript, he found it to be a generally sound work. “It then became clear to me,” ‘Abd al-Hayy al-Laknawi (1973: 206) wrote,

that [Ibn Nujaym’s] interdiction of fatwas on its basis had to do, not with the intrinsic qualities of this work or [the credentials] of its author, but only with the fact that the book had become inaccessible. This is a matter that varies from one age or region to another. Many a book is extinct in one place but available in another, hard to find at one time and plentiful at another. ... Consequently, if a work [like the Muhit] is found to be in wide circulation at a particular time or place, the [earlier] ruling [concerning its inadmissibility in fatwas] is revoked.

Related to but going beyond the availability of particular texts to people at a certain time and place is the larger question of how intellectual traditions interacted with the particular regional contexts in which they might come to find themselves. What did it mean for texts originating in Central Asia or Iran or Anatolia or Egypt to be studied in, say, northern India? In writing a commentary or gloss on a particular text, as was standard practice in the milieu of the madrasa, a scholar was not simply explaining it to his students and readers. Nor was he only adding to his resume, establishing his scholarly credentials, instructing his students in the relevant crafts, and seeking patrons. He could be and often was doing all of that, but such writing could serve also to appropriate a text to a particular milieu, to make it intelligible in a particular time and place (Brentjes 2018: 225).

In a short tract called Risala-yi danishmandi, which was concerned with the principles of pedagogy that ought to guide a teacher as he trained his students in the fundamental intellectual skills that would allow them to become scholars and teachers in their own right, Wali Allah noted that the teacher ought to make his discourse easily understandable (sahl al-tanawul) (Wali Allah 1858: 7).[35] He had also given other basic advice to teachers: to explain difficult and unfamiliar terms in the text under study and to illustrate complex ideas with examples (Wali Allah 1858: 5-6); to distinguish in a text things liable to be conflated with each other and to try to harmonize seemingly conflicting things (tatbiq-i mukhtalifayn), or explain how to account for the divergence in question (Wali Allah 1858: 6); translate the passages under discussion into the native language of his students (Wali Allah 1858: 7); and, not least, “combine the author’s text with [the teacher’s] own [discourse] in a way that the result is a harmonious blend” (Wali Allah 1858: 7). This is the kind of advice that would have been good for any aspirant to

pedagogical success, but at least some of it helped to indigenize an otherwise foreign intellectual tradition to local conditions.[36]

Unsurprisingly, perhaps, one can see some of these principles at work in Wali Allah's own intellectual career. His concern with making things simpler and translating them as needed is best illustrated by his translation of the Qur'an into Persian. He spent a good deal of his intellectual energies on harmonizing the differences between rival schools of Sunni law, between law and Sufism, and within Sufism. Wali Allah's Izalat al-khafa ^can khilafat al-khulafa, a large work that seeks to highlight the merit of the first two Rashidun caliphs, Abu Bakr (r. 632-634) and 'Umar (r. 634-644), against Shi'i detractors, proceeds by way of extensive quotation from hadith and is an excellent example of the "blending" (mazj) of the texts under discussion and the teacher's own discourse that Wali Allah advocates in his Risala-yi danishmandi. Finally, it is worth noting that Wali Allah's writings are replete with illustrations drawn from his natural and cultural environment in India. For instance, enlarging on his signature argument that God communicates with people in an idiom and in terms of ideas and practices to which they are already accustomed, Wali Allah (2010: vol. 1, 258; as translated, with some modification, by Hermansen 2003: 265), observes:

a speaker of Arabic who only knows the Arabic language, when knowledge is represented to him through verbalization, will find it only represented to him in Arabic, not in some other language. Likewise, in those countries where elephants and other animals of ugly appearance (sayyi al-manzar) are found, the visitation of the jinn and the frightening of the devils appear to its inhabitants in the form of these animals, while this is not so in other countries.

Many of Wali Allah's fellow Indians would not have agreed that an elephant was an animal of ugly appearance but they would have concurred, of course, that the sight of a wild elephant could inspire great terror. In any case, to an Indian audience, it is a readily accessible example. To take another instance, in speaking of the Qur'an's aesthetic qualities, Wali Allah invoked Indian ragas - which he had heard country folk perform - to note that what people had in common was their ability to find pleasure in melody, but that the principles governing it and their particular tastes in it necessarily varied from place to place (Wali Allah n.d.a: 30).

On the question of how a wide-ranging intellectual tradition might be indigenized, it is worth noting, too, that, in India, as indeed elsewhere, the texts that were often taught to students included not only old classics but also books of relatively recent vintage. Bahr al-'Ulum's father, Mulla Nizam al-din (d. 1748), is often credited with formalizing a curriculum of madrasa education and, though that curriculum would continue to evolve, the imprint Nizam al-din had put on it is highlighted by its very name - the Dars-i Nizami. In a work devoted to scholars and saints of the Farangi Mahall, Wali Allah Ansari (d. 1853), a scion of the family who died just a few years before the formal establishment of British colonial rule (and is not to be confused with Shah Wali Allah of Delhi),[37] speaks frequently of "textbooks"

(kutub-i darsiyya) (Ansari 1881: 9) and, indeed, of “the textbooks used in these regions” (kutub-i darsiyya-yi in di-yar) (Ansari 1881: 35). This suggests the role someone like Mulla Nizam al-din may have played some generations earlier in helping standardize the curriculum, though that standardization would presumably have built upon texts that were already well-established in his part of the world. The receptivity of the curriculum to works produced in India, and written in living memory, is worth noting. Several of the works included in Nizam al-din’s curriculum were by scholars more or less contemporary with him, notably the Sullam al-Ulum, a work on logic by Muhibb Allah Bihari (d. 1707); the Musallam al-thubut, on legal theory, also by Muhibb Allah Bihari; and another legal work, the Nur al-anwar, by Mulla Jiwan (d. 1717). These were fellow Indian scholars (Nu‘mani 1934b: vol. 3, 100; Zaman 2007: 66; for a similar point, though not with specific reference to India, see Brentjes 2018: 225). It was common for subsequent generations of "ulama to write glosses on such works and, in the process, to indig-enize the tradition still further.

*** 3. Rival Traditions: Competition and Confluence

I turn now to the question of rival traditions in the literal and figurative space of the madrasa. In broad terms, it is possible to distinguish two streams of education in northern India in the eighteenth century - the rationalist, which was represented by the Farangi Mahall scholars, though not by them alone, and the traditionalist, represented by Shah Wali Allah. [38] Yet, a positing of such differentiation would be misleading if we do not first note the considerable overlap that existed between these two streams. As Wali Allah’s aforementioned Risala-yi Danishmandi itself shows, luminaries in the rationalist tradition such as Sa‘d al-din Taftazani (d. 1390), Jalal al-din Dawani (d. 1504), Habib Allah Mirza Jan (d. c. 1586), and Mir Muhammad Zahid (d. 1689-90) were part of his intellectual genealogy.[39] About Wali Allah’s son Shah ‘Abd al-‘Aziz, often remembered like his father as muhaddith Dihlawi - the hadith-scholar from Delhi - it was said that he “was immensely learned in the religious sciences (al-Ulum al-diniyya) and was knowledgeable (‘arifan) in logic and philosophy” (al-Hasani 1970: vol. 8, 210, quoting the rationalist scholar ‘Abd al-Haqq Khayrabadi who died in 1900). Students and scholars routinely drew from both rationalist and traditionalist streams. Sadr al-din Azarda (d. 1858), who had served as a mufti and judge for the British before getting into trouble on suspicion of having issued a fatwa in support of the Mutiny of 1857, is reported to have acquired the “transmitted” sciences - that is those not primarily concerned with reason and rationalism - from Shah ‘Abd al-‘Aziz and other members of his family and the rational sciences from Fadl-i Imam Khayrabadi (d. 1828), a noted scholar in those areas of inquiry (‘Ali 1914: 93).[40] For his part, ‘Abd al-Razzaq b. Jamal al-din (d. 1889), a prominent Sufi master from the Farangi Mahall family, had studied hadith with students of Shah ‘Abd al-‘Aziz (‘Inayat Allah 1988: 153).[41]

Yet, if there were significant overlaps between the rationalist and the traditionalist streams, the distinctions between them could also be substantial. In his Tafhimat al-Ilahiyya, Wali Allah castigated those training to become ‘u-lama for

“busying themselves with the Greek sciences (‘ulum al-Yunaniyyin) and with morphology (al-sarf), syntax (al-nahw), and rhetoric (al-ma‘ani) and thinking that this was knowledge [proper].” He (Wali Allah 1967: vol. 1, 282-83) continued:

Knowledge [proper] comprises [rather] a clear verse from the Book of God, which you [ought to] study together with the exegesis of its peculiarities and its difficulties as well as the occasion of its revelation. It comprises, too, the normative example of the Prophet of God, so that you learn how the Prophet performed the ablutions; ... how he fasted, undertook the pilgrimage, and conducted warfare; what his speech was like, the guarding of his tongue, and his manners, so that you can follow his guidance. . Also [included in this knowledge proper is] righteous obligation (farida ‘adila), which you ought to learn - the elements of ablutions, ritual prayers and their parts, the minimum amount on which zakat becomes due and how much one ought to give away, and the shares from the inheritance of the deceased. Additional to this are the accounts of military expeditions (al-siyar) and the stories of the companions [of the Prophet] and their successors, which serve as an exhortation [to be mindful] of the hereafter. As for what you have busied yourself with, and have gone to excess in pursuing, it is not knowledge conducive to the hereafter (^culum al-akhira) but rather worldly knowledge (^culum al-dunya).

In his Altaf al-quds, too - a work in mystical thought that sought to steer clear of both the rational and the transmitted sciences - Wali Allah (1894: 95) had offered a stinging denunciation of

the followers of the philosophers, who, in regard to the beliefs they hold in opposition to the beliefs of the prophets of God, ... are dogs, indeed worse than dogs. A dog does not sniff at an old bone whereas these wretched ones are sniffing at and licking two thousand year old bones.[42]

The Farangi Mahall scholars, for their part, were typically concerned with precisely the kind of sciences of which Wali Allah was highly critical. And they allowed a much smaller space in their curriculum to scripture, commentary and hadith than what Wali Allah had studied with his father or what he would be concerned with in his own teaching and writing. For instance, the aforementioned Wali Allah Ansari (d. 1853), a prolific Farangi Mahall scholar, was the first of only two scholars in this family ever to have written a commentary on the Qur’an (‘Inayat Allah 1998: 281).[43] Ansari was unusual among the Farangi Mahallis for his interest in the transmitted sciences, but there were some others, too. One notable instance is represented by Anwar al-Haqq b. Ahmad ‘Abd al-Haqq (d. 1821), a leading Sufi master of the family. Though a student of the famed ‘Abd al-‘Ali Bahr al-‘Ulum, Anwar al-Haqq had a dim view of the rational sciences: “the fruit of the speculative sciences (^culum-i nazariyya) is nothing but disputation and argumentation,” he is quoted as saying. “It is useless for the Hereafter, though in this world

it does help overcome the opposing side; such sciences are best abandoned” (Ansari 1881: 36).[44] ‘Abd al-Hayy Laknawi, whose comment on works falling out of circulation was cited earlier, was likewise unusual for the extent of his interest in hadith studies.[45]

Conversely, even apart from the evidence of his own education and that of his sons, Wali Allah’s polemic against the rational sciences remains misleading. His magnum opus, the Hujjat Allah al-baligha, though focused on hadith, is premised on the conviction that not only are shari‘a injunctions concerned with the protection and promotion of human interests (masa-lih) but also, crucially, that the way in which these interests are promoted is rationally discernible and demonstrable. In concluding the first part of that book, he had noted (Wali Allah 2010: vol. 1, 451; translation, with minor modifications, from Hermansen 2003: 478, emphasis added), in evoking tradition, reason, and mysticism, that

God, may He be exalted, put into my heart ... a measure by which to recognize the cause of every difference arising in the community of the Prophet Muhammad, may peace and blessing be on him, and of what is correct according to God and His messenger, and He enabled me to confirm this by rational and shari‘a proofs (al-dala’il al-‘aqliyya wal-naqliyya) so that there should remain no ambiguity or doubt.

In the end, his criticism of the rational sciences had more to do, perhaps, with a desire to distinguish his own intellectual tradition from the more uncompromising votaries of the rational sciences than it did with a disavowal of those sciences.

Besides a difference of emphasis in terms of content, there were differences in pedagogical styles as well. Mulla Qutb al-din and his son, Mulla Nizam al-din, the putative founder of the Dars-i Nizami curriculum, had tended to impart knowledge of the various sciences to their students through a focus on one or two books from each discipline. The books in question tended to be highly demanding and the rationale in focusing on them was that once they had been mastered, the students would find it relatively easy to study other books in that discipline (Nu'mani 1934a: 123-24). The concern was evidently with inculcating the ability for “deep reading” - (mutala'a) - a feature common to styles of learning in the seventeenth and eighteenth centuries (Nu'mani 1934b: vol. 3, 99-100; el-Rouayheb 2015). Anchored as it was on a small number of key texts, this approach enabled “a student of average intelligence” (mutawassit al-zihn), as Shibli Nu'mani would have it in the early twentieth century, to complete his education by the time he was sixteen or seventeen (Nu'mani 1934b: vol. 3, 100).

Despite Nu'mani’s generally favorable comment on the pedagogical style of Mulla Qutb al-din and Mulla Nizam al-din, it is unclear that merely “average” students really did thrive on this approach. To the extent that they were able to master the texts in question, though Nu'mani did not say so, it would often also have had to do with the family background of the

students. Scholarly norms and a grounding in facets of an intellectual and religious tradition did not after all come only from formal exposure to books and participation in study circles, but also from the experience of growing up as part of an educated family. That experience - in the words of Bourdieu (1973: 80), the “linguistic and cultural competence and that relationship of familiarity with culture ... produced by family upbringing” - is what would have allowed one to complete his education while still in his teens (cf. Eickelman 1985: 88. For a somewhat different perspective, see Brentjes 2018: 131-35). By the same token, youths from less fortunate families would have had to struggle harder, and longer, to acquire the learning requisite for scholarly recognition.

Putting the most demanding texts at the core of pedagogical training may, however, have posed challenges even to the children of the intellectual and religious elite. Commenting on the study of logic in the madrasa, Shibli Nu'mani himself had acknowledged that the 'ulama of his own and of previous generations were not well-grounded in it even after they had read many books relating to it. He (Nu'mani 1934a: vol. 3, 124-25) attributed this to an unwholesome admixture of various philosophical topics with the science of logic properly speaking, but it may also have been the case that teaching students the most demanding of the available texts was not the most efficient way of introducing them to a discipline (cf. Ibn Khaldun 1858: vol. 3, 252; Rosenthal 1967: vol. 3, 293).

Wali Allah (1858: 4) too had complained that the various sciences had become mixed up with one another, with the result that those studying them as part of their education failed to develop a mastery in any of them. His intention in explicating the principles of pedagogy was precisely to facilitate the acquisition of the different sciences by those seeking them. In marked contrast with the characteristic approach of many Farangi Mahall scholars, his emphasis, as noted, was on simplicity of discourse (suhulat-i taqrir) and on its being accessible (sahl al-tanawul) (Wali Allah 1858: 7).

Although the madrasa curriculum in South Asia still bears the imprint of its association with the Farangi Mahall, it is the influence of Wali Allah and his sons, not that of the Farangi Mahall, that has come to loom the largest on the madrasa in the Indian subcontinent as well as in the South Asian diaspora. It is tempting to think that this has had something to do with the sustained engagement of Wali Allah and his sons with the Islamic foundational texts: as noted, Wali Allah had translated the Qur’an into Persian, two of his sons produced separate translations of it into Urdu, and another son, Shah ‘Abd al-Aziz, had written a partial but substantial commentary on it in Persian. Wali Allah had also given a good deal of attention to the study of hadith. He had written two commentaries on the Muwatta of Malik (d. 795), which he regarded as the most authoritative of all collections of prophetical norms, and the key arguments of his Hujjat Allah al-baligha are anchored in hadith. In hindsight, this scripturalism looks well-suited to developing the kind of eminence that Wali Allah did in fact come to enjoy in traditionalist circles in South Asia. Yet it was not inevitable that Wali Allah should have come to enjoy this eminence or, for that matter, that even scripturalism should have become a dominant strain in modern and contemporary Islam.

How Wali Allah’s legacy came to be cemented in the nineteenth century is a complex story that cannot be taken up here except in one respect. This relates to the role that those associated with the network of Deobandi madrasas played in extending Wali Allah’s influence in India and beyond. In 1866, fewer than ten years after the formal establishment of colonial rule in India, a madra-sa was founded in the north Indian town of Deoband; over the following decades, it would spawn numerous others throughout the Indian subcontinent. Deoband’s founding fathers counted members of Wali Allah’s family as part of their intellectual genealogy. There was also an affinity between Wali Allah’s interest in hadith and that of the Deobandis. In becoming part of Deoband, Wali Allah’s legacy found a home that was not destined - despite hadith scholars like ‘Abd al-Hayy Laknawi - to be available to the Farangi Mahall or any other intellectual tradition.[46] Some of the success of Wali Allah’s legacy may also have owed itself to his pedagogical approach, namely making things simpler and more digestible rather than approaching them through the most difficult texts of the genre.

The Farangi Mahall and the Deobandi traditions have had within them scholars who were not just capable of but also willing to adapt their tradition to changing needs. ‘Abd al-Bari (d. 1926), one of the last of the Farangi Ma-hall scholars of some standing, had written many glosses on standard madrasa texts, but he had also authored, reportedly in no less than thirty-four parts, a work on science and theology (Risala-yi science o kalam) (‘Abd al-Bari n. d.: 22; ‘Inayat Allah 1988: 181-82). For his part, Muhammad Qasim Nanotawi (d. 1877), one of Deoband’s founding fathers, was notable for his interest in the rational sciences and, unusually among his contemporary "ulama, had expressed some interest in learning the English language as well (Gilani 1980: vol. 1, 348-84, vol. 2, 299-300). The dominant strain among the Deobandis was, however, to be the study of hadith and law.

There is no reason intrinsic to the "ulama’s rationalist tradition that may have caused it to lose to the more traditional sciences. But there are extrinsic reasons for this outcome, two of which go some way towards accounting for the gradual marginalization of the madrasa’s rational sciences. First, as Western learning, anchored in modern rationalism, began to gain currency from the late nineteenth century, the madrasa’s rationalist tradition came to lose its prestige in ways that Islamic scripturalism did not. Indeed, the very decline in the appeal of the madrasa’s rational sciences would have strengthened the hold of the Qur’an and the hadith not just within the madrasa but also outside it, including in Western educated Muslim circles. Here, an important confluence might be observed between the scripturalism inherited from the likes of Wali Allah, on the one hand, and, on the other, the appeal to the Islamic foundational texts, and of a Qur’an-and hadith-based legal tradition, as a way of anchoring Muslim identity in conditions of colonial rule. Second, and on a different note, the organizational model of the Deobandi madrasas lent itself to survival and growth in colonial India in ways that the Farangi Mahall tradition did not, with the result that the intellectual concerns characteristic of the Deo-bandis thrived while those of the Farangi Mahall did not. As observed earlier, the careers of the Farangi Mahall scholars were typically tied to the

largesse of rich and powerful patrons. The case of ‘Abd al-‘Ali Bahr al-‘Ulum is unusual only in the range of his patrons, not in the pattern of patronage itself. Though Deobandi madrasas could also have some rich patrons, they typically depended on the support of relatively ordinary people. It was not through substantial endowments but rather through small, often quite humble, financial contributions that Deobandi madrasas would often be sustained in their local contexts. This made for financial instability in a madrasa’s life, but it also helped create a network of supporters. And where the destruction or resumption of a charitable endowment or the decline of a great house spelled the end of the relations of patronage, the backing of smalltime contributors could long keep madrasas afloat. This organizational model, which would extend from Deobandi madra-sas to madrasas belonging to other doctrinal orientations in South Asia, meant that while the institution of the madrasa saw severe decline in many Muslim societies with the onset of colonial rule it experienced remarkable growth in colonial India. Indeed, it would not be an exaggeration to say that the madrasa as a formal institution of learning, rather than as a set of practices typified for students and colleagues by a scholar, really only emerged in India on a wide scale in colonial times (on a related note see Cantwell Smith 1981: 197-212).

While Deobandi madrasas are the most successful examples of this institutionalization, an unsuccessful effort in that regard is equally telling, and it merits a brief discussion. Scholarly work on the life and career of Shah Wali Allah and of his sons refers frequently to the Madrasa-yi Rahimiyya, which Wali Allah’s father, Shah ‘Abd al-Rahim (d. 1719), is said to have founded. This institution features prominently in an influential biography of Wali Allah, Hayat-i Wali, by the early twentieth-century scholar Rahim Bakhsh Dihlawi. According to Rahim Bakhsh, Wali Allah taught for twelve years after his father’s death at this madrasa. He subsequently went to the Hijaz on a pilgrimage and resumed his teaching at this madrasa upon his return (Dihlawi n.d.: 229-31, 261; see also Ahmad 1919: vol. 2, 585-86). Though he cited no source for the institution he called the Madrasa-yi Rahimiyya, Rahim Bakhsh was probably indebted for this information to one Sayyid Zahir al-din, a great-great-grandson of Shah Wali Allah and the proprietor of a publishing house, the Matba‘-i Ahmadi, active in late nineteenth-century Delhi. Zahir al-din was better known as Sayyid Ahmad and he would sometimes add “Wali Allahi” to his name to highlight his descent from his distinguished forebear. He had made it his mission to publish the writings of Wali Allah and of his sons, and in the fiercely competitive world of late-nineteenth-century book publishing, an association with Wali Allah was apparently a rewarding proposition. But Zahir al-din had an additional goal, too, and that was to revive the family’s madrasa.

Books published by Zahir al-din’s press in the 1890s often introduced it as associated with the Madrasa-yi ‘Azizi, a madrasa that purported to have belonged to Wali Allah’s aforementioned son, Shah ‘Abd al-‘Aziz. (Zahir al-din was the maternal great-grandson of Shah Rafi‘ al-din, a brother of ‘Abd al-‘Aziz.) Announcements appended to editions of Wali Allah’s books and those of other family members regularly informed readers of Zahir al-Din’s efforts to revive “the old madrasa” (madrasa-yi kuhna) of ‘Abd al-‘Aziz, which, by the 1890s, was said to have been defunct for some four decades. Indeed, family members living in that building had ceased to be aware that it had once been a madrasa; and the building itself had been demolished during the Mutiny of 1857.[47] It was that

madrasa that Zahir al-din sought to revive, and the publication of Wali Allah's manuscripts - a part of the family heritage - was intended to support that enterprise (Wali Allah n.d.b: 108). Zahir al-din's published announcements implored people to make financial contributions to help sustain that madrasa as a matter of religious obligation.[48] And buying books published by his press was a step in the same direction.[49] The madrasa, where teaching had begun in late 1892, proved to be much less successful than the publishing house, however, and it appears to have fizzled out shortly after its inception. Though I have not come across an explicit reference to the Madrasa-yi Rahimi-yya in any of Zahir al-din's numerous announcements, he had clearly left a mark in the public (and scholarly) imagination that the madrasa he had been trying to revive was the same institution, indeed located at the very site, at which Wali Allah and 'Abd al-Aziz, among others, had once taught.[50]

Yet, in marked contrast with the near ubiquity of the Madrasa-yi Rahimiyya in the scholarship on Wali Allah, it is remarkable that his own writings and those of his sons and associates are entirely silent on it. For instance, in his brief autobiographical note, Wali Allah does not identify the place he taught at for twelve years following the death of his father. Nor does Muhammad 'Ashiq Phulati's (d. 1773) al-Qawl al-jali fi dhikr athar al-Wali (Phulati 1989), the single most important source on the life and mystical thought of Wali Allah written by a close relative and disciple, mention any institution called the Madrasa-yi Rahimiyya.[51] I know of only one scholar, Mahmud Ahmad Barakati, the author of a valuable study on the family of Wali Allah first published in 1976, who explicitly recognizes that the name Madrasa-yi Rahimiyya was coined by Zahir al-din, Wali Allah's great-great-grandson. Even Barakati (1976: 81-82), however, goes on to assert that the Madrasa-i Rahimiyya had indeed existed from the time of Wali Allah's father, except that it had lacked that name until Zahir al-din came up with it (Barakati 1976: 8i-82).[52]

My point here is not to deny that a particular site with which Wali Allah or his sons were associated could have been referred to by them or by others as a madrasa. Indeed, it was. Towards the end of Wali Allah's life, Mughal Emperor 'Alamgir ii (r. 1754-1760) had made a land grant to him "for religious uses for a mudrissa." That land grant was later resumed by Mughal authorities and subsequently restored to Shah 'Abd al-Aziz by the British.[53] 'Abd al-Aziz had remained associated with that madrasa and, as has been seen, it was at his madrasa that he had once asked a devotional singer to perform an Indian raga. My point is rather that such sites were far less institutionalized than hindsight would have it. Part of Wali Allah's house seems to have been used in his lifetime, and in that of 'Abd al-'Aziz, for teaching purposes (Barakati 1976: 87, 91). And, as 'Abd al-'Aziz told the devotional singer who had visited him there, it only became a madrasa when people engaged in their studies there. By the late nineteenth century, madrasas clearly had an institutional existence, as typified, above all, by those associated with the Deobandi orientation. Zahir al-din, the publisher, was probably thinking of the competing Deobandi ma-drasas when he asserted, in his advertisements, that "the organized manner in which religious and worldly education is imparted to Muslim children [at his madrasa] is unparalleled anywhere else" and that people ought to attend to its needs before they did to those of any other (statement appended to 'Abd al-Ra-him n.d.: 40). Yet, in the absence of any serious effort to

cultivate time-honored pedagogical and scholarly practices, even the prestige of the Wali Allah family name did not suffice to sustain that madrasa.

Although Zahir al-din did not say anything specific about his madrasa's curriculum, it is not surprising, given the institutional form that madrasas had come to acquire, that their curriculum also became more stable in the colonial era. Even as they were meant to provide an alternative to the colonial system of public education, the madrasas founded in the late nineteenth century were modeled on the public schools: they had a standardized curriculum - this, indeed, is when the Dars-i Nizami became an India-wide curriculum - and they had classrooms, annual examinations, convocations, prize-giving ceremonies, and vacations (Metcalf 1982: 87-137). Yet, even in that age of standardization and of much rhetoric among the Ulama on the need to preserve their religious tradition unchanged, significant experimentation could and did continue in the substance of the Dars-i Nizami. The different doctrinal orientations - the law and hadith-centered Deobandis, the Barelawis with their devotional practices focused on holy men, the Ahl i-Hadith or Salafis who tended to deny the authority of the schools of law - all had their own madrasas, and their curricula, while having many features in common, reflected their particular orientations. There was also experimentation within particular orientations. Early in his teaching career, the influential Deobandi Sufi and scholar Ashraf Ali Thanawi (d. 1943) had devised two versions of the Dars-i Nizami curriculum - one offering the full range of transmitted and rational sciences and the other for those who were not inclined to study the rational sciences. He had also devised an abbreviated thirty-month curriculum to benefit those who did not have the time to study the full breadth of the Dars-i Nizami. This shortened curriculum, he said, "brought together the essentials, with which one could fortify one's faith, and indeed become a religious scholar, of middling status but with broad learning" (quoted in Zaman 2008: 20). This was obviously for the benefit of people whose primary vocations were other than those of the 'ulama but who nonetheless wanted to partake in the 'ulama's tradition. Colonial and postcolonial madrasas have been slow to accommodate the public school curriculum into their fold. This has had to do with the suspicion that the government was trying to take over the madrasa - the last bastion of Islam, as the rhetoric often goes - and that a mixed curriculum would produce people who were mediocre all around. Yet, here, too, it has in fact become common for madrasas to combine the public school curriculum in various measures with religious learning and it is no longer unusual for recent madrasa graduates to be able to read works in the English language.

The madrasa tradition has continued to evolve even when those associated with it have viewed that evolution with misgivings and have resisted it. Ultimately, as I have tried to show, it is not as an institutional structure or even as a body of texts but rather as a set of practices that the madrasa is best understood. It is through these practices that knowledge has been transmitted and imbibed, students trained to become 'ulama - or other things, for that matter - and networks of scholars fostered. These practices have helped forge a relationship with earlier authorities and they have served, as they still do, to establish new claims to authority. They have provided the framework in which the old and the new, the cosmopolitan and the local, the religious and the political, and, indeed, the divine and the human can interact and inform one another. In this sense, the madrasa is a

far more lively, and contentious, space than its modern or medieval embodiments would seem to suggest.

** 3. Interpretive Anthropology and Islam in Morocco: A Comparison between Geertz and Eickelman

Abdelrhani Moundib

Clifford Geertz (d. 2006), Dale Eickelman, Lawrence Rosen, Hildred Geertz and Paul Rabinow are surely the most prominent anthropologists who studied Moroccan society. They represent the interpretive approach, whereby they tried to understand the nature of the Moroccan social system, and pinpoint the mechanisms of change that derive from the concepts with which people form their individual and cultural representations of a worldview and build their social relationships. This theoretical conception drove both Geertz and Eickelman, as outstanding figures within this interpretive trend, to focus more on studying religious beliefs and related practices as a key to understanding the social system in Morocco.

The present chapter aims to display the most important findings of the interpretive trend on Islam in Moroccan society, and to do this through a comparison of the works of Geertz and Eickelman.[54] Even if Eickelman rejects the idea of an interpretive school (of which he is a part with the others), I believe that a careful reading of their books clearly shows that what binds these two great anthropologists is much stronger than what separates them (Eickelman 2009). It is true that each of these two great anthropologists of Islam has his own style of writing and analysis, yet they still share the same ideas and employ the same methods in their approach to Islam in Morocco. The chapter aims to demonstrate, in detail, the areas of similarity and difference between the works of the abovementioned scholars.

*** 1. The Theoretical Framework: The Weberian Theory on the Interaction between Cultural Systems and Religious Beliefs

All anthropologists acknowledge that Clifford Geertz is one of the greatest contributors to the development of the study of cultural and symbolic systems within the range of anthropological practices in connection with theory and methodology.[55] Since his article “Religion as a Cultural System,” Geertz has developed a general definition of religion that might fit all possible religious forms. According to him, religion is “a system of symbols which acts to establish powerful, pervasive, and long-lasting moods and motivations in men by formulating conceptions of a general order of existence and clothing these conceptions with such an aura of factuality that the moods and motivations seem uniquely realistic” (Geertz 1996: 4). By this definition, he means that religion connects the core image of truth to a set of coherent according to which men ought to live. He thus tends to accommodate human activities to the general order of existence, and thereby displayed representations of such an order that transcend human existence. Despite the criticism that Geertz’s analytical model of religion attracted, I think that it is clear and practical, for it supports the Weberian conception that transcends a more simplistic view, and sets a dichotomy between the

illusion of absolute autonomy of the religious discourse and the reductive view that makes that discourse a direct reflection of social structures. Bourdieu (d. 2002), later adhered to and approved of this Weberian perception (Bourdieu 1971: 299).

Dale Eickelman took the same path. Actually, he said that “ideas and systems of ideas, especially those which fundamentally shape men’s attitudes towards the world and their conduct in it, cannot be analytically construed as ahistor-ical Platonic entities, unaffected by the ravages of time” (Eickelman 1976: 3). According to him, Weber’s style of sociology implicit in The Protestant Ethic and the Spirit of Capitalism, is “amenable to the analysis of specific historical situations, and also has the advantage of lending itself more easily to a conceptualization of sociological variables over time than the style of argument in which historical dimension is presented only in superimposed synchronic layers” (Eickelman 1976: 5). In addition, Eickelman often referred to the ideas of Geertz that support the Weberian thesis. He made use of them to draw the milestones and frontiers of the theoretical references and backgrounds that shaped his study on Boujad.

In light of the above, it is clear that both Geertz and Eickelman relied, at least to a certain degree, on the Weberian paradigm, according to which studying religious identity was groundless unless handled within the religious system of which it formed a part, as well as the social context from which it was derived. Accordingly, both anthropologists managed to study Islam in Moroccan society within a context of social change. In other words, it was set in its historical context.

*** 2. Connecting Historical and Social Structure

The interpretive trend is mainly characterized by its use of the tools of both the historian and the anthropologist to study religious systems. Since the theoretical bases of this connection have already been outlined, in the forthcoming section I will look to highlight the practical implementation of this methodological trend throughout the aforementioned works of Geertz and Eickelman.

Geertz considered Moroccan history to be basically a religious one.[56] It is in the first place made by the religious figure of the saint who is actually a martial leader who builds cities and destroys ramparts. Idris ii (d. 828), who is the first substantial king of Morocco, was at once a descendant of the prophet (d. 632), a vigorous military leader, and a dedicated religious purifier. The latter two traits stand as the determining factors in establishing his kingship over the country. In addition to this, Geertz (1971: 8) wrote, “both the Almoravid and Al-mohad movements were founded - the first around the middle of the eleventh century, the second towards the middle of the twelfth - by visionary reformers returning from the Middle East determined not just to inveigh against error but to dismember its carriers.” Moreover, the so-called maraboutic crisis that marked Moroccan history for more

than two centuries, caused the decline of the Almohad ideology and the collapse of the dynasty. It was to the ascendant Alawite dynasty to put an end to that crisis.

Both Geertz and Eickelman embrace the view that Islamic civilization in Morocco was essentially forged by the “mobile and aggressive tribes” (Geertz 1971: 9), who represented the core of the cultural weight. However, Eickelman adds a touch of relativism to that idea. He believes that, from the advent of Islam to its arrival in Morocco, cities have engaged in economic exchange with rural tribes. Additionally, cities played a major role in the fabric of political activities. As he (Eickelman 1976: 18) put it, “from the advent of the Muslim conquest they [cities] progressively became and remained very much interdependent economically with their rural hinterlands and involved in the same range of political activities. Only since the onset of the protectorate has the gap between the two again widened.” Geertz supposed that the impact of religious scholars grew stronger due to the French and Spanish occupation of Morocco, at least compared with “ancient Morocco,” when it was quite limited. Not only did the European invasion trigger wrathful reactions against the of invading Christianity, but also against ancient maraboutic tradition. While Eickelman had been inclined to believe that the reformist ideology failed to make up for that of the marabouts and saints, Geertz thought that Islam managed to maintain its social character and identity during the period of the occupation. However, it was the Berber daher (decree)[57] that spurred the emergence of both the Salafist and national movements. Actually, Morocco managed to sustain its spiritual unity thanks to the institution of the monarchy. Mohammed v (d. 1961) brought the idea of the saint back to life, for he embodied the convergence of both pious saint and competent politician. Consequently, the monarchy in Morocco, which embraces both intrinsic and contractual traditions, is key to understanding not only the nature of the political system, but also the religious system of this society (Geertz 1971: 77).

Eickelman, in his turn, focused on the crisis of the marabouts that lasted from the fifteenth to the end of the seventeenth century. He studied in detail all possible causes, such as the loss of the very lucrative trans-Saharan gold trade with the development of alternate routes, the Spanish and Portuguese occupation of the Moroccan coasts, the Marinid sultan’s renunciation, and the presence of the Ottomans in Algeria, who were not under direct pressure from Christian power, and who supported the opposition against the policies of the Marinids. In addition, Eickelman refrained from ascribing the isolation of Morocco, which lasted from the seventeenth to the nineteenth century, to natural factors such as mountain ranges and the lack of natural harbors. Instead, he imputed the isolation to the succeeding monarchs who reigned during that period. As he (Eickelman 1976: 16-17) explained, the importance of these mountains and the lack of natural harbors in isolating Morocco have often been exaggerated. The use of such geographical factors as natural barriers to explain the course of Moroccan history has primarily a metaphorical utility. During most of the Middle Ages of Europe, the fortunes of Morocco were closely linked with those of the Iberian Peninsula; for certain extended periods, the Iberian Peninsula was even ruled from Morocco. From at least the seventeenth through the nineteenth centuries it was less any natural barriers than the policies of its successive rulers which isolated Morocco both from Europe and, to a lesser extent, from the Middle East as well.

Comparing the ideas on Moroccan history of both Geertz and Eickelman reveals that, although Eickelman shared the same general conclusions as Geertz, his knowledge of the prominent historical events, and the ongoing debates about their significance and impact on the course of Moroccan history, was perhaps deeper and more accurate. While reporting historical data, Eickelman chose a strategy based on painstaking detailing. In his craft, he was amply engaged in theoretical argument with a view to highlighting the deficiencies of the writings of the colonial era, in connection with which he named certain researchers such as Alfred Bel (1938) (d. 1945). Furthermore, there are others whose names he failed to mention, such as Ernest Gellner (d. 1995), David Hart (d. 2001), and Geertz himself, in some delicate details of Moroccan history. The reader might conclude that Eickelman avoided referring explicitly to areas of difference with Geertz. Indeed, he worked at displaying and emphasizing the areas of similarity.[58]

Compared with Geertz, Eickelman opted for a more practical historical perspective in the study of social reality. Yet, both demonstrated that understanding the present was closely associated with knowing about the past.

*** 3 Islam in Morocco according to Geertz and Eickelman

Clifford Geertz based his observation and analysis of changes in religious life in Morocco on historical and field data collected about the topic. He started from the major theoretical assumption that religion is a social institution, worship a social activity, and belief a social power. Therefore, studying the religious life of a specific society ought to start from analyzing the systems of significance that individuals use within their social life. “To trace the pattern of their changes is neither to collect relics of revelation nor to assemble a chronicle of error. It is to write a social history of imagination” (Geertz 1971: 19).

Based on this methodological conception, Clifford Geertz set forth the analysis of the story of the Saint Lyusi (d. 1691). According to him, the story symbolizes for Moroccans “the real image of spirituality,” regardless of who the man was in reality. Lyusi became a mythic figure bearing a broad and deep cultural significance. Through his analysis of the figure of this saint, as it is perceived and dealt with in the Moroccan popular imagination, Geertz reveals the core meaning of the baraka, which is not merely a religious concept but an integral religious doctrine. It means thereafter that the sacred gets manifested in the world as a divine gift endowed to elect people (Geertz 1971: 44). The righteous saint owns the baraka in the same way as people acquire power, bravery, beauty or other gifted qualities and it can also be acquired through being a direct descendant of the prophet. The issue of possessing the baraka - whether through one’s lineage, miraculously, or both - symbolizes most of Morocco’s cultural and historical dynamism. The story of the relationship between Saint Lyusi and Sultan Moulay Ismail (d. 1727) is a representation of the actual existing relationship between the lineage and miraculous

aspects of the baraka, and how the second gains recognition and legitimacy from the first.

The saints, the owners of the baraka par excellence, were the real founders of consciousness and the model shapers of society in “ancient Morocco.” However, things started to followed a new track at the beginning of the twentieth century. In fact, the religious life of Moroccans has noticeably changed. Naturally, that has been expected since “religion is not the divine, but a conception of it. People deal basically with perceptions on religion connected necessarily to spatial and temporal specific functions” (Geertz 1971: 56). Actually, Moroccans worked hard to limit the growth of contradictions that arose due to the changes that affected their society throughout the experience of colonialism, to include the erection of new institutions that emerged with the recovery of national sovereignty. The Salafist movement strove strongly to prevent the clash between religion and science by making the latter focus its concern on material questions whose outcome did not necessarily embrace religious facts. “Science is deemed as science and religion as religion” (Geertz 1971: 106). Since the task of religion is to make life less difficult to grasp for believers and less contradictory with common sense, and since religious belief is the origin of the common sense that forges and shapes social action, the modified religious traditions of Morocco remain subordinate to the continuity of the lifestyle that they depict. This explains in great part how “in Morocco the bulk of the ordinary life is secular enough to suit the most dedicated rationalist” (Geertz 1971: 112).” Despite the density of religious considerations in Moroccan society, they do not play the requisite role of behavioral guide except in some limited cases. Furthermore, they largely withdraw off the stage when it is a matter of trade and political issues.

The discrepancy between the forms of religious life and the essence of everyday life is thus running inevitably into a point of spiritual schizophrenia. Geertz believed that religious life in Moroccan society did not witness any noticeable changes from the end of the 1960s (the period of publication of his book Islam Observed) to the beginning of the 1990s (the period of publication of the French translation of the book) due to the continuation of the political regime. Unlike many other Islamic countries, Morocco did not compel religion to submit to violent changes perpetrated by some form of central authority (see introduction to French translation in Geertz 1992). According to Geertz, this provides a real safety valve against all religious protestations. It explains how the state has managed, throughout successive governmental strategies, to limit the jeopardy posed by Islamic movements, whose influence has been confined to the sanctuary of the universities and some marginal areas. Geertz (1992: 2) elucidated,

The spiritual view of Moroccans is integrated, not fragmented into dissonant trends. Therefore the central issue is to implement this view in daily life. In addition to that, the adaptation, the reconciliation and the changes in attitudes which have occurred due to recent alterations, have taken the feature of practicality rather than that of ideology.

Concerning Dale Eickelman, through his aforementioned work, he sheds light on two aspects of the religious life of Moroccan society. On the one hand, he carried out a meticulous analysis of the nature of the concepts that shape the Moroccan worldview. On the other hand, he worked on deconstructing and reconstructing the religious beliefs that govern what he calls “the ideology of Maraboutism.”

Eickelman noticed that the majority of the studies produced about Islam and Islamic society were confined to analyzing written texts and the explicit religious ideology that the religious intelligentsia diffused. Indeed, reformist movements with plain and clear ideologies attract numerous researchers who are keen on studying the topic. However, popular beliefs, whose defense appeals to almost nobody, have but a few researchers who make the topic an object of study and who analyze their sociological context. As Eickelman (1976: 11) explained:

Relatively few studies of Islam have ventured beyond the presentation and the analysis of written texts and the explicit ideologies of an articulate of religious intelligentsia. In contrast to various reformist movements that have explicit ideologies and representatives willing to discuss them, little attention has been given to the description and analysis of popular “tradition” beliefs and their social context.

In fact, the studies made first by Jacques Berque (d. 1995) and later by Clifford Geertz represent the most prominent and brightest signs in this context. Therefore, in Moroccan Islam, Eickelman sought strenuously to approach Islam as it is perceived and lived by the people in Moroccan society, and to provide sociological significance to certain changing forms in one of the greatest religious traditions. “The primary goal is to make sociological sense of the changing forms in which certain key, contradictory elements of a major religious tradition have been understood in a specific locale over the last century” (Eickelman 1976: 4).

A Moroccan view of the world is founded, according to Eickelman, on five basic concepts, namely l-mektub (God’s will), ^cqal (reason), hshumiya (propriety), haaq (obligation), and ^car (compulsion). These concepts engulf logical significances that are proportional to each other. They are like puzzle pieces that are differently shaped, but when put together form a harmonious, congruent and meaningful structure. The concept of l-mektub, which apart from God’s will also means destiny or fate, explains the reality of things in the present and in the future. It legitimizes the disparities that occur when social positions and privileges are allocated among individuals, for it ascribes this differential to God’s will. People who believe in l-mektub are not only those who accept the volition of God, but also those who strive to adapt their deeds to harmonize with the divine will. The concept of qal implies having empirical knowledge and the capacity to harness the rules of behavior - in other words, the rule that matches, from an analytical point of view, the requirements of the world of significations that all Moroccans share and in which all Moroccans live. In fact, that world is permanently susceptible to

change, negotiation and renegotiation. Affirming the possession of qal is based on the extensive capacity of individuals to demonstrate their familiarity with the “rule” (in the Moroccan wording) that is specific to each situation.

The concept of hshumiya (propriety) is defined as the caution or prudence needed to adhere to the rules that all members of society share. Hshumiya is not merely that innate ethical consciousness that governs individuals’ public behavior in their regular relationships, but it also means not infringing the framework of expectations associated with highly esteemed others. The fourth concept, haaq (obligation), which shapes the Moroccan view of the world, has various meanings that depend on the context but, apart from obligation, also include destiny, privilege, commitment, share and undertaking. The meaning that Eickelman intended to convey, though, pertained to the connections that result from the relationships of obligation that individuals have with one another and that constitute the tissue of society. In most cases, such connections are characterized by their lack of balance. In fact, all obligatory relationships impose the fulfillment of certain commitments, the outcomes and worth of which are preliminarily set. The fifth and last concept, ^car (compulsion), is the moral burden imposed on an individual or group whose disposal is contingent on fulfilling the concomitant request. Eickelman (1976: 14) drew a distinction between two types of ^car. The first, ^car kbir (greater compulsion) is used to settle conflicts between tribes and large groups.

The ^car kbir, which virtually disappeared upon the establishment of French control, involved the mediation by marabouts or their descendants of disputes between tribes, tribal sections, or local communities. The prestige of the marabout called upon was commensurate with the gravity of the dispute involved. At least ideally, marabouts even interposed themselves between contesting groups to bring about a cessation of hostilities. Alternatively, the flag from a “dead” marabout’s sanctuary or the cloth shroud (ghota) of his tomb, carried by one of his descendants, could be used to compel a truce or settlement.

Second, there is ^car sghir (lesser compulsion), which is confined to using among individuals, who resort to it when they feel it is necessary. This latter type of ^car still persistently exists. Eickelman considers that the concept of compulsion is the ultimate expression of a relationships of obligation, which people resort to when the other procedures that characterize this type of relationship fail. It is used eventually in some cases to fix broken relationships, or to force an individual to answer a given request. One of the most important and implicit principles is that one abstain from questioning the validity of the situation that led to the compulsion.

The analysis that Eickelman presented about the constitutive concepts of Moroccans’ worldview, despite the fact that some readers found it hard to accept or remained unconvinced by certain interpretations, remains strong and coherent to a great extent. It

sheds light on an important aspect of religious life in Moroccan society that has been obscure for a long period of time.

Eickelman believed that these major concepts lay at the core of Moroccan common sense. Actually, the common-sense view of how things should normatively be is an essential determining factor in the formation and interpretation of social experience. The common belief that the concepts that shape the Moroccan world view necessarily spring from Islamic principles, which are what accord it its legitimacy. He also sees that, despite the presence of certain religious symbols in the commonsense view, we could not consider the religious beliefs as a mere symbolic expression of the social organization. Nevertheless, the commonsense and religious views remain entangled and interconnected. In this respect, Eickelman (1976: 153), cites Geertz as follows, “as Clifford Geertz has written, religious symbols formulate a basic congruence between a particular style of life (if, most often, implicit) metaphysic, and in so doing sustain each with the borrowed authority of the other.”

Eickelman has in fact shown how Moroccans give greater value to the particularity of their social organization and commonsense, which are characterized by a certain realism and flexibility. Concerning what he designs as the ideology of maraboutism, he underlines that it is a system of beliefs that are fashioned within the Moroccan society and believed whose permanence is connected to a specific social process. These beliefs have, for four centuries, assigned a meaningful form of Islam to tribes and city dwellers alike, and this form is still necessary to some of them. Although the protectorate regime managed to reduce the singularity of the social process that maintained the ideology of maraboutism - alternative forms of Islamic belief appeared in cities and gave an ideal normative form to how the supernatural could be - the reformist ideology failed to make up for all maraboutic ideological instances. Thereafter, Eickelman sees that although knowledge of the principles of orthodox Islam has become stronger than it was in the past, the Islam that the reformists are claiming is less compatible with Moroccan social organization and common sense. Islam, like other great religious traditions, is subject to reformulation and reinterpretation of beliefs by its adherents through successive generations and in novel contexts, even if the adherents themselves are unaware that they have already done so.

*** 4 Geertz and Eickelman: Areas of Similarity and Difference

Through what has been shown, it is clearly salient that there is no discrepancy between the theses of Geertz and Eickelman about Islam in Morocco.

Nevertheless, this does not mean that one paraphrases the other (especially with respect to Eickelman’s thesis, which was produced after Geertz’s). The relationship between the two can be fairly apprehended in terms of areas of similarity and difference, rather than antagonism or imitation.

**** 4.1 Areas of Similarity: Methodology and General Conclusions

The comparison of two significant works of Geertz and Eickelman (Islam Observed and Moroccan Islam) revealed numerous areas of similarity related to the methodological steps the authors adopted, as well as the general conclusions they reached. The two scholars agreed about the following general and basic issues.

First, due to their lack of adequate analytical tools, the researchers who came before them had failed properly to understand the nature of religious life in Moroccan society. Eickelman, for example, despite their quantitative importance, regarded colonial studies as, cognitively outdated because of their shortage of requisite analytical tools, as well as their connection to the colonial machinery. As he (Eickelman 1976: 21) remarked,

The most elaborate assessment of the Maraboutic Crisis remains that developed by French colonial historians, basing themselves upon historical and ethnographic research conducted in the first part of this century. Such studies were primarily undertaken by individuals directly or indirectly concerned with establishing or maintaining the machinery of the protectorate.

In fact, “with few exceptions, even later colonial literature ... reads more like police dossiers on the potential influence of various orders, together with certain formal, written elements of their doctrines, than an attempt to understand their popular character [as] an appeal” (Eickelman 1976: 29). “The main features of North African Islam have often been taken for granted or otherwise misrepresented in much of the literature on the region” (Eickelman 1976: 6). Nonetheless, “it is clear that Westermarck [1926] (d. 1939) was an extremely talented ethnographer. One constantly regrets that he lacked a concept of culture as [an] interrelated set of symbols and meanings” (Eickelman 1976: 63). He then went on to say that, “lacking an adequate conception of social structure as based on culturally accepted means by which dyadic bonds between persons are contracted and maintained, ethnographers instead sought, and failed to find, order at the level of ‘on-the-ground’ social relations and the use of physical space” (Eickelman 1976: 91). Geertz (1971: 119), on his part, did, however, acknowledge that

there is much useful information in Terasse [1950] (d. 1971) and some original and valuable ideas, but there is also a pervasive colonial bias and a rather, to my mind, simplistic interpretation of the course of Moroccan history. In the English abridgement of this work ... its virtues are discarded and its faults concentrated. ... On saint worship, perhaps the best descriptive work is E. Dermenghem [1982] (d. 1971), Le culte des saints dans l’Islam maghrebin ... but there is not much in the way of sociological in it.

Geertz (1999: 21) was critical of segmentary theory, and his criticism was recurrent throughout the works of Ernest Gellner (1969) (d. 1995) and David Hart (1973) (d. 2001). He believed it to be a ready-made theory seeking pattern and example in North African societies. As he (Geertz 1999: 21) put it:

The book as a whole gives a picture of an overplanned enterprise getting instructively out of hand. And although, from a point of view, this is testimony to the fact that Gellner is acute enough to rise above his principles, from another, it suggests that the best way to solve the intricacies of North African society is not to descend upon it with a finished theory looking for an instance.

Second, the relevance of their choices of study fields with respect to validating their generalizations on a national (Moroccan) level, was associated with segmentary studies on Moroccan society having encountered much criticism because of this issue. In fact, to realize the ideal conditions in which to implement the segmentary theory, Gellner, Hart and all the researchers who followed their paths chose tribal regions, which were shut off from all forms of external influence, including that of the central authority (Makhzen). Nonetheless, the interpretive researchers, Geertz and Eickel-man being among the most prominent, took the precaution of choosing urban and rural areas that were subject to the direct authority of the Makhzen. Despite the chosen areas (Sefrou for Geertz and Boujad for Eickelman) not being middle towns in Morocco, namely cities that encompassed all the characteristics of a Moroccan city, they amply defended their choices and their relative representativeness. This would maintain the rigor and credibility of their studies when it came to the question of generalization. Many prominent Moroccan researchers, however, remained unconvinced by this generalization (Guessouss 2002: 18).

Third, to comply with the prevailing social organization and common sense, as specified earlier, religious beliefs and related practices in Moroccan society are incessantly being submitted for reformulation.

The fourth and final area of similarity between the two authors concerned the importance and influence of the central authority in reproducing shared ways of thought and religious organization, and the orientation of the religious enthusiasm of Moroccans.

**** 4.2 Areas of Difference: Writing Style and Categorization

Geertz’s writings and research on religious beliefs are generally characterized by a unique style of writing, presentation and categorization. He writes in English with a quite complicated literary style, full of metaphor and simile, and plenty of appositive clauses and parentheses. His style is eloquently articulate, although he opens many brackets and brackets within brackets. Only Bourdieu (1971) in his French language would run in the same

fashion. Besides that, his method of categorization distances itself from traditional academic styles. This seemingly turgid writing style, and peculiar method of categorization, confers a touch of ambiguity on his style. Yet, this can be explained by the impromptu framework in which comparative religious studies have been wrought (Geertz 1971: 23). Accordingly, many of his critics - like Talal Asad, Paul Shankman, and Henry Munson Jr. - qualify his studies on religion as suffering from a great disproportion between theory and practice (Asad 1983; Munson 1986; Shankman 1984).

The complete opposite of that is the style of Eickelman, which one might describe as flowery and eloquent. Eickelman presents his ideas with pure lucidity. Furthermore, he carefully makes his categorizations and partitions readily understandable and easy to assimilate without losing depth and intricacy. Alongside his painstaking concern for detail, is a deep and meticulous knowledge of the history and social structure of Morocco.

Dale Eickelman displayed the capacity to build firm and sound social relationships with his informants. These ties were not founded on transient interests, but characterized rather by the kind of warmth and permanence that enabled him to earn the trust of everyone with whom he interacted during his fieldwork. Moreover, his familiarity with Moroccan Arabic and French paved the way for him to approach notable individuals in possession of accurate and useful knowledge of Moroccan history, which, because of the predominance of an oral over a written tradition in the society, had never before been recorded. Consequently, his knowledge of Moroccan history is more inclusive and more accurate than that of Geertz.

Despite interpretive anthropology having long been an analytical trend and an established anthropological school, the works of both Geertz and Eickel-man on religious life in Morocco have exercised, and continue to exercise, an important influence on the Moroccan academic field. In addition, the scientific and personal relationship between the two men remains surprisingly sound, even in the aftermath of Geertz’s death.[59]

** 4. Out of Sight in Morocco, or How to See the Jinn inthe Modern-day Museum

Simon O'Meara

A picture held us captive. And we could not get outside it, for it lay in our language and language seemed to repeat it to us inexorably.

ludwig wittgenstein

This chapter explores Dale Eickelman's counter-intuitive insight that seeing in the modern-day museum is something that needs teaching. Exploring this pedagogical desideratum in the cultural context to which it pertains, namely, Islamic culture, the chapter highlights the extent to which the modern-day museum strives for absolute visibility and shows how this aspiration fits awkwardly with Islamic culture, which is as much about invisibility as visibility. Responding to a recent challenge in visual anthropology that scholars should try to build a knowledge of their subject from a place epistemologically equivalent to the Quranic al-ghayb (the unknown, or invisible), the chapter first grapples with the museological display of Islamic art from the place of the mostly invisible jinn. Second, it

explores the extent to which the modern-day museum is embedded within a wider urban culture wed to a desire for total visibility and a certain type of pictoriality. This modern Western visuality, the chapter concludes, is in a certain way the opposite of Islamic visuality.

As anyone who has witnessed Dale Eickelman working in Morocco will tell you, he does not stand apart from his interlocutors, but fits right in. To the extent that it is possible, he closes the gap between observer and observed, not through imitation and costume but empathy and the absence of all superiority. Remaining in plain sight, he yet disappears. Often he does so while pursuing his interests in aspects of the country that are themselves hidden from view, the cloak of power having rendered them invisible, as with, for example, the operations of the king's bureaucracy, the Makhzan. Taking my cue from these interests and his modus operandi, I propose to explore further the issue of invisibility by centering my argument on the disappearing jinn. I shall investigate the jinn's resistance to the space and representational system of a cultural institution that developed in Europe in the nineteenth century: the

modern-day museum. Whereas Eickelman is an out of sight anthropologist to those with eyes to see, to visitors of the modern-day museum the jinn are not just out of sight but not even in the picture. How, then, might one see the jinn there, and why?

*** 1. How to See in Museums

In the president's newsletter for the Tangier American Legation Institute for Moroccan Studies (talim) of December 2017, Eickelman speaks of the institute's ongoing mission to help protect the cultural heritage of Morocco. "One recent project," he recounts, "has been to compile online lesson plans on 'How to See in Museums,' intended for intermediate and secondary school teachers in the region" (Eickelman 2017: 2).

At first glance, this teaching initiative seems plain wrong, for what could be more transparent to the eye than a museum, a primary purpose of which is to exhibit, or hold out objects to sight? (Basu and Macdonald 2007: 2.) Graeme Davison underscores this pivotal function of the modern-day museum when he takes the Panopticon, a planned but unbuilt eighteenth-century circular prison with a glass surveillance tower at its center, and compares it to a precursor of the modern-day museum. The precursor in question is London's Great Exhibition of 1851, which was housed in transparency itself - the purpose-built Crystal Palace in Hyde Park. Davison (1982/3: 7 cited in Bennett 1995: 65) remarks: "The Panopticon was designed so that everyone could be seen; the Crystal Palace was designed so that everyone could see." The V&A Museum originated from what the visitors saw there.[60]

How one negotiates the culturally coded space of the modern-day museum might need the mediating presence of a teacher, a possibility that Carol Duncan (1995) exposed in her celebrated book on the art museum as a ritual site. The objects exhibited might also be

deemed in need of pedagogic intervention to render them legible (Costantino 2008; on legibility itself, see Bennett 1998). But seeing in the museum is surely immediate, in need of no intervention, for the modern-day museum is predicated on sight.

To be sure, sight's dominion there has a history, and the museum has a history of techniques to facilitate this dominion (Bennett 2006). Additionally, recent developments in museum practices suggest that the sovereignty of sight may be giving way to sound and touch (Bennett 2006: 267; Promey 2017: xxii). Even so, because the museum's exhibitionary order overlaps with other modern exhibitionary orders, each reinforcing the other, sight is not going to be overtaken soon (Bennett 2006: 279). Principal among these other orders is the shopping arcade and, especially, the department store, with its encyclopedic range of products on display in carefully curated vitrines (Cummings and Le-wandowska 2000; Mitchell 1988: 10-11; Whiteley 1994: 110-11). As Gudrun Konig (2016: 43) notes: "The association between the museum and the department store, trumpeted as a post-modern phenomenon, [is] a relationship with a long history."

What is Eickelman talking about, then, when he speaks of learning how to see in the museum? To answer this question means asking if the sight the museum facilitates is culturally and historically specific. If it is, one might indeed need to learn how to see there if one were from a country with only a limited history of museums; for example, the countries of the Arab Gulf, where the rapid development of state-sponsored museums commenced only in the 1970s (Exell 2016).

It is exactly this question of museum vision that is addressed in the present chapter. It is my contention that a very specific type of sight is promoted in the modern-day museum that is at odds with, and even defies, quotidian ways of seeing in Islamic lands. As I shall contend, this sight, or "museologi-cal gaze" cannot register the peripheral, penumbral dimensions of seeing in Islamic lands. It cannot accommodate, I shall argue, a visuality (a technical term I shall shortly define) sutured by worldly and otherworldly invisibility - by, for example, the jinn of the natural world and the evil eye (al-^cayn) of the supernatural world. For all its powers of penetration, and perhaps because of them, the museological gaze is insensitive to Islamic visuality, seeing through its shadows. As I shall demonstrate, it cannot account for a dimension of the Islamic cosmos that defines the realm of Islam writ large, namely, the invisible, divine world: the world of the unseen (^calam al-ghayb).

The argument is not that the Islamic art on display in museums represents the evil eye, the jinn, and the unseen, and that this representation does not somehow register in the museological gaze. Rather, the argument is first that the visuality this art indexes is incompletely accommodated in this gaze; and second that the index itself, the artifacts comprising the art, becomes present in a different way before this gaze. The representational system of the modern-day museum presents the index afresh: it represents it. For all that a museum might claim that it has on exhibition this or

that never-seen-before artifact from this or that distant land, what one sees in the museum is the artifact’s representation as a museum object, not the thing itself. As W. J. T. Mitchell notes (2005: 156-57) regarding this distinction between an object and a thing:

Objects are the way things appear to a subject - that is, with a name, an identity, a gestalt or stereotypical template, a description, a use or function, a history, a science. Things, on the other hand [signal] the moment when the object becomes the Other, when the sardine can looks back, when the mute idol speaks, when the subject experiences the object as uncanny.

Museological representation is one of the ways through which things become objects.

This museological representation has nothing to do with the meta-level questions of representation that the modern-day museum is perennially engaged: how and why an artifact is selected for display and the choices that are made regarding, say, the lighting of that display. It has to do with something more fundamental: the transformation of the artifact by what Svetlana Alpers (1991: 27) calls the museum effect, or “the tendency to isolate something from its world, to offer it up for attentive looking and thus to transform it into art like our own.” Donald Preziosi (2006: 50, emphasis in original) speaks of a similar effect when he explains that “the act of collecting and exhibiting artifacts, of passing them across an exhibitionary threshold, is much more than an act of removal from some prior place, context, or condition. The object is not simply transported but transformed.” It is the museum effect, Alpers argues, that leads to the following default museological condition: “It is to ourselves ... that we are representing things in museums” (Alpers 1991: 32).

Does this museum effect matter? That depends on who we are. It might matter if we were, say, secular Europeans and wanted our audience to include more Muslim Europeans.[61] Whoever we are, the effect could certainly benefit from unpacking. Hence the timeliness, not to mention the correctness, of Eick-elman’s pedagogical initiative.

*** 2. Islamic Visuality

The term visuality is first found in the work of Thomas Carlyle (d. 1881) (Sand 2012: 89). Islamic art historians have sometimes used it, but without defining it (e.g. Necipoglu 2007: passim; Ruggles 2007: 132). In one or two of these usages, it would seem to be a synonym for the term visual culture, a parallel that would echo the usage of one of the foremost students and theorists of visuality, the aforementioned W. J. T. Mitchell (2002: 166-67). This leaves us, then, with the meaning of visual culture.

As Mitchell (2002: 178) explains, the study of visual culture is the equivalent of “ordinary language philosophy [in that] it looks at the strange things we do while looking, gazing, showing and showing off, such as hiding, dissembling, and refusing to look.” For Mitchell, this explanation means at least two things. First, that the study of visual culture, what is often called visual studies (Elkins 2003: 1-30), entails, inter alia, “a meditation on blindness, the invisible, the unseen, the unseeable, and the overlooked” (Mitchell 2002: 170). Second, it means that this study cannot be limited to the “study of images or media, but extends to everyday practices of seeing and showing, especially those that we take to be immediate or unmediated” (Mitchell 2002: 170).

Attempting to encapsulate this capacious field of study, Mitchell offers the chiastic aphorism that visual studies has for its object of study the social construction of the visual field and the visual construction of the social field. By the second part of the aphorism, he means that “it is not just that we see the way we do because we are social animals, but also that our social arrangements take the forms they do because we are seeing animals” (Mitchell 2002: 171). Visuality and visual culture are the two interchangeable names for this object of study; Islamic visuality and Islamic visual culture, the names for when the object pertains to Islam. Because it names this object of study, there is no plural: there are not Islamic visualities, for example, which is not to say that the visuality in question cannot comprise a number of different scopic regimes. For example, the visuality of the modern West is substantially informed by the scopic regime that Martin Jay calls “Cartesian perspectivalism” (because it derives from the quattrocento invention of linear perspective), but it is not reducible to this regime (Jay 1988: 4). An equivalent regime informing Islamic visuality would be the concept of modesty (haya’) (Maghen 2007: 342-90; O’Meara 2007: 49-56). Historically variable scopic regimes such as these act on the human organism’s physiological drive to see, or its scopic drive.

*** 3. Islamic Visuality and the World of the Unseen

It is debatable whether the aforementioned evil eye constitutes one of the historically variable scopic regimes of Islamic visuality or is a hard-wired part of it. That it might be the latter is because of the awesome power ascribed to it, the Prophet alleging that the evil eye was as strong as death itself, with the ability to outstrip divine destiny, or fate (qadar). He is reported as saying, for example: “After natural causes, the evil eye is the greatest cause of death in my community” (Ibn Hajar al-Asqalani 2001: vol. 10, 287); and “Were anything to outstrip (sabaqa) destiny, it would be the evil eye” (Muslim 1994: vol. 7, 425). This unearthly potency would suggest that the evil eye was related to the world of the unseen, which in turn would suggest that it formed the immutable core of Islamic visuality; for as Shahab Ahmed (2015: 345-48) has so persuasively argued, to be Muslim - to be Islamic - is to be in continuous engagement with the world of the unseen.

As an aside, the following interpolation by a nineteenth-century Muslim translator of a French book on the “customs and mores of nations” is indicative of the place of the evil eye

in Islamic visuality and suggestive of how this visuality differs from modern Western visuality. In the French book, there is a sentence on the Middle Eastern belief in the evil eye, which reads as follows: “Throughout the Orient, the people fear what they call the evil eye” (Dep-ping 1826: 189). In the translation, it is rendered as: “One of the beliefs (^caqa^cid) of the Europeans is that the evil eye has no effect” (al-Tahtawi 1833: 86). Having lived in Europe for five years, the Middle Eastern Muslim translator knew well that the Europeans recognized the evil eye as much as they recognized the jinn. Neither phenomenon registered in their sight.[62]

Just as the evil eye’s relationship to the world of the unseen is uncertain, so too is the jinn’s relationship to that world. That is because although the Qur’an implies that with the coming of Islam no more can the jinn “steal the hearing” from heaven (Q 15:18, 72:8), it also says that they try to linger at heaven’s boundary, straining to hear the “high assembly” (Q 37:8, 72:9). The occasional snatching of divine secrets would therefore seem to be a possibility still open to them, something the Qur’an appears to confirm (Q 26:221-22) (cf. Hawting 2006: 27; but see also Chabbi 2001-6: vol. 3, 43, 46, who excludes that possibility). This possibility is borne out in the popular imagination, where by and large the jinn retain their pre-Islamic status as beings capable of accessing the unseen world, and even being of it (Mittermaier 2019: 21-22; Padwick 1924: 426; Pandolfo 2018:90-98,269).

For present purposes, whether or not the jinn belong to the world of the unseen is not of importance. What matters, rather, is the jinn’s ability to appear and disappear from sight, to transform from seen to unseen beings; for this ability visually replicates what divides the seen from the unseen world. This ability is important, for the following reason.

In her book on the jinn, Amira El-Zein argues that these feared beings are intermediary beings, because they perpetually traverse the divide between the seen and the unseen worlds. This divide, she blankly asserts, is the basis of “the whole of Islam” (El-Zein 2009: xviii). Given the signal importance of this divide in the thought of the aforementioned Shahab Ahmed, specifically as expressed in his posthumous publication What is Islam? (Ahmed 2015: 343-86, esp. 377ff.), El-Zein’s assertion is not unreasonable.

Recently, another scholar, Amira Mittermaier, has effectively asked scholars to be jinn-like, by challenging them to traverse intellectually this divide between the seen and the unseen worlds so as to read Islamic culture through the lens of the unseen (al-ghayb) (Mittermaier 2019: 18). Al-ghayb, Mittermaier explains, should be understood not just as an ontological zone but a “site of epistemological reflection [because it] presupposes a particular attitude and relationship to the world, in which the very condition of not-knowing is the foundation not only of faith but also of any knowledge” (Mittermaier 2019: 20). As such, she provocatively concludes, scholars of the Islamic world should in turn try to build a knowledge of this world from a “place of al-ghayb,” a locution I read figuratively to mean a place epistemologically equivalent to al-

ghayb, it being impossible for scholars to be of the unseen (Mittermaier 2019: 30). With specific reference to anthropologists, she then adds that writing from a place of al-ghayb “means asking not simply how to do an anthropology of the invisible but also how al-ghayb can inflect anthropology” (Mittermaier 2019: 30).

In the section that follows below, I tentatively and very provisionally take up Mittermaier’s challenge for Islamic art history, including its public face, the Islamic art museum, by engaging with the jinn as a proxy for al-ghayb.

*** 4. Dis/appearing Jinn

In the Qur’an, Earth is effectively split into two domains, that of humankind and that of the jinn; numerous are the verses in which God simultaneously addresses both categories of sublunary created beings (Chabbi 2001: 46). The two domains are not, however, sealed off from each other, such that humans can, mostly inadvertently and unwillingly, enter the jinn’s domain and the jinn can, less inadvertently and unwillingly, enter the humans’ (Chabbi 2001: 44). With the exception of certain extraordinary individuals and the rarest of instances, the jinn are invisible to humans; they can, however, assume the form of an animal or even a human, and in that way appear and disappear before our very eyes. (The literature on this subject is vast, but for an introduction, see El-Zein 2009: 22-26, 89-120.) This means that Islamic visuality is not just fundamentally informed by invisibility, in that, as per Shahab Ahmed, Islam is structured by the divide between the seen and unseen worlds of the Islamic cosmos; but more mundanely, and equally Quranically, Islamic visuality is riddled by dis/appearance. For phenomenologically speaking, the jinn are dis/appearance itself. “Appearance,” writes Heidegger, “does not mean that something shows itself; rather it means that something which does not show itself announces itself through something that does show itself” (Heidegger 2010: 28).

If in modern Western visuality the phenomenon of dis/appearance is accounted for by the history of art - an art of optically registered appearance since the quattrocento until the rise of abstraction in the twentieth century[63] - the same is not true in Islamic visuality. For Islamic art is only exceptionally about the appearance of things; only rarely is it optically naturalistic.[64] In Islamic visuality, the phenomenon of dis/appearance is accounted for by the jinn. To display Islamic art as if it were, in Alpers’s words, an “art like our own,” namely, an optically naturalistic depiction of the appearing, physical world, and to do so without bringing into the picture the jinn, is to transform Islamic art, exactly as she says. Not only does the Islamic world comprise the jinn, but Islamic art rarely depicts the world.[65]

*** 5 Glass Boxes

At the heart of the problem of the display of Islamic art in the modern-day museum is the fact that the museological gaze is part and parcel of modern Western visuality, not Islamic visuality, as I shall explain below. Stickers almost need to be affixed to the display cases to announce the fact, in the same way that stickers are often affixed to plate glass windows and doors to prevent people walking into them. Doing so would not constitute a pointless joke, because the display cases contribute to the creation of the museological gaze. As Khadija von Zinnenburg Carroll (2017: 24) notes: “The glass between the artefact and the viewer is the [gaze’s] epistemic membrane crystallized around an object.”

The display cases might even be what create the gaze. As the same author writes elsewhere: “Built within the very architecture of the museum, vitrines are a structure of thinking. That structure frames any subject and object that enter the space but typically remains unanalyzed despite its effect on the formation of the ideas on display” (Carroll 2013: 318). According to this argument, the display box acts like a lens, similar to the lens of a microscope, telescope or camera. The lens establishes both the subject, who utlilizes the lens, and the object, which is scrutinized through the lens.

Carroll’s argument is not hyperbolic. Lewis Mumford, for example, considers that early-modern European developments in glass-making, coupled with the widespread introduction of transparent glass these developments led to, gave birth to the modern scientific world. He writes: “[Transparent] glass helped put the world in a frame: it made it possible to see certain elements of reality more clearly; and it focussed attention on a sharply defined field - namely, that which was bounded by the frame” (Mumford 1934: 125-26; cf. Onians 2016: 269). Mumford (1934: 180-81, fig. 2) even lists the plate glass window alongside the microscope and telescope: one of the panoply of dioptric instruments invented in this period (cf. Friedberg 2006: 110).[66] Others have interpreted woodcuts by Durer (d. 1528) showing the use of just such dioptric instruments as an encapsulation of the scientific method itself, namely, the establishment of an object over which a subject stands in unblinking scrutiny (Figure 4.1).

In the top woodcut, we see an artist using an eyepiece and a pane of transparent glass to create a linear perspective drawing of a vase or ewer. In the bottom woodcut, we see an artist using an eye-pointer and a pane of gridded but otherwise transparent glass to create a linear perspective drawing of a reclining nude, up whose parted thighs he stares. Regarding this bottom woodcut, inter alia, this interpretation has followed: the objectification of woman/nature by the male artist/scientist subject via his framed, instrumentalized, penetrative sight (Nead 1992: 11; cf. Dunn 2002: 223; Anderson 2003:328-29).[67]

*** 6. Linear Perspective

It is no coincidence that the glass-wielding artists in Durer's two woodcuts are making linear perspective drawings. As Samuel Edgerton asserts in his book The Mirror, the Window, and the Telescope: How Renaissance Linear Perspective Changed Our Vision of the Universe: "No rocket ship to the moon could ever have been invented, let alone be built and function, without the humble heritage of Renaissance linear perspective" (Edgerton 2009: 171). Although Edgerton's assertion sounds exaggerated, there is no shortage of assertions that could replace it. For example, the historian of modern science, David Wootton (2015: 14-16), refers to the invention of linear perspective as the beginning of the "mathematization of the world," and thus the seed of the scientific revolution and origin of the modern world (cf. Harries 2001: 14-16).

In view of these assertions, we should take seriously Preziosi's (2006: 53) claim about the representational logic of the modern museum and its mu-seological gaze. "Museums," he says, "put us in the picture, by teaching us how to appear picture-perfect." The reason we should take it seriously is because our being in the picture is also the effect of linear perspective. The linear perspective painting is an extension of our own space: we are the subject of it, paradoxically constructed by it. Linear perspective, in the words of Norman Bryson (1984: 77, emphasis in original), "is a personal construction, where the image recognises (more accurately, constructs) the viewer as a unitary subject, master of the prospect, unique possessor of the scene." In Preziosi's claim, the modern museum acts similarly, recomposing the fractured identity of the modern subject into a coherent picture. As he (Preziosi 2006: 53) explains his claim:

[The museum is a place that enables the] modern social subject to be constituted as an anamorphosis of the bits and pieces of its own life and experience: a place from which to view those bits in such a way as to realign them in a (previously hidden or invisible) order, a "story" that makes a certain sense. ... What the museum subject "sees" in this remarkable institutional space is a series of "mirrors" - possible ways in which it can construct or compose its life as one or another kind of centered unity or consistency which draws together in a decorous and telling order its sundry devices and desires.

For all that the museum is about the objects it exhibits and archives, it is also all about me. As when viewing a linear perspective painting, in the museum I stand tangible, corporeal and whole, possessing - and possessed by - a world of absolute visibility (cf. Bryson 1983:

106; see also below). This world is no world of the jinn, fleeting shadows of dis/appearance. As Christian Suhr (2015: 109) has argued regarding the ultimate dioptric instrument of linear perspective construction, the camera, the jinn are outside the picture.[68]

Next, when I step outside the museum, not only do I find its world of absolute visibility reinforced by that of the department store and shopping arcade, as mentioned earlier, but also by that of the city as a whole. Exactly as Middle Eastern visitors to the world fairs of nineteenth-century Europe also experienced, there seems to be no outside to the exhibitionary order of the museum, because the city replicates it (Mitchell 1988: 5-12). The city, too, is arranged for my view, as a picture. This arrangement speaks of an urban practice whose origins date to trecento Italy, specifically Florence and its new satellite towns. As Marvin Trachtenberg (1987: 181-84) says of this period of Florentine history in his award-winning book The Dominion of the Eye:

Trecento painters shared with urban planners an intense engagement with the observer, with controlling the location and angle of vision and coordinating what is seen with where it is ideally seen from. This scop-ic desire led to the devising, respectively, of illusionistic and real spatial structures that fixed the ideal viewing point of both painting and monumental architecture, sometimes with extraordinary precision. Both media solicited the ambulatory viewer’s immobility at a particular station, where the spatially structured and structuring pictorial and scenographic image was ideally to be sensorially produced and visually consumed. Whether this new experience was essentially “pictorial” or “architectural” is rather moot.

Trachtenberg argues that the quattrocento invention of linear perspective in Florence was dependent on the trecento city’s incipient early-modern visuality, and that the historical linkage between the two was provided by Brunelleschi’s (d. 1446) lost perspective-demonstration panels. These panels are said to have represented two of the city’s principal monuments, the Palazzo Vecchio and Baptistery, both built or reworked according to the principles of trecento urbanism. As such, Trachtenberg (1997: 52-54) argues, the panels tie trecento visuality to the quattrocento invention of linear perspective and further cement the bond between urbanism and painting initiated in the trecento.

For Trachtenberg (1997: 260), the Panopticon-like visuality that the trecento gave rise to was deliberately produced and reproduced by the Florentine state as an instrument of authority. It is not hard to see its apotheosis in Baron Haussmann’s redevelopment of Paris in the mid-nineteenth century (see Benevelo 1993: 124-71 on the historical role of perspective in urban design). Although the following eye-witness account by a Tunisian visitor to Haussmann’s Paris refers to the experience of seeing a photographic panorama of the redeveloped city at the Paris world fair of 1889, not the city itself, the words of the visitor are nonetheless revealing: “No different from reality … the observer sees himself at the center (fi wasat) of the city, surrounded by its buildings, streets, and gardens” (al-Sanusi 1891: 242). The visitor feels as if he is in a picture.

Haussmann’s Paris epitomized modernity. The replication of aspects of its perspectivally ordered space was thus not infrequently sought by Muslim states wishing to display their modern credentials (AlSayyad 2011: 206-12; McChesney 2002: 88). However, the visuality to which this exported space belonged to was at a variance to the visuality it was imported into. That is because, for the most part, medieval and pre-modern Islamic urbanism eschews perspectivally ordered public spaces. On the occasions where something approaching perspectivally ordered public space is found in the Islamic context, as for example at the royal square of Safavid Isfahan, these represent the exception, not the rule. In the words of D. Fairchild Ruggles (2000: 107):

The opening up of space to allow long sight lines and sweeping views was more dramatic in the medieval Islamic context than a modern reader might initially realize. In the medieval environment, walls, doors, screens, and veils curtailed vision at every pass. . Even in the supposedly public spaces of the city ... there were few occasions when long-range views encompassing large spaces and many people were possible.

Against this Islamic urban background, it is hardly surprising that the aforementioned Middle Eastern visitors to the world fairs of Europe found the cities there astonishing in their perspectivally ordered pictoriality, or intizam almanzar (literally, organization of the view) (Mitchell 1988: 12-13). The reverse was no less true for the same period’s European visitors to the Middle East. They found the Islamic medinas incomprehensible and impenetrable, lamenting their lack of a “point of view,” or linear perspectival ordering principle (Mitchell 1988: 21-26). Only by heading for elevations beyond the perimeter walls could these Europeans see them as they wanted: as pictures (Mitchell 1988: 24-26; O’Meara 2020: 469).

*** 7. Bigger Boxes

The gradual demise of the department store and shopping arcade in the twenty-first century city has not ended the reciprocal relationship between the modern-day museum and the city. As cities inexorably succumb to what is called “brand urbanism,” or the co-opting of public space by a corporate revisioning of it, in many ways Apple Inc. leads the way with its iconic glass storefronts. First among these storefronts is the cubical one on Fifth Avenue, New York. What, however, is this structure if not a museological vitrine writ large? It is a display case, albeit one wherein the item exhibited is not an Apple product but the Apple logo itself, the company’s merchandise having been relocated to the store proper, below ground.[69]

In the light of the connections this chapter has drawn between the early modern and modern history of Western urbanism, the department store and the museum, it might strike the reader as odd to learn that this Apple storefront in downtown New York, this “temple of consumerism,” was originally mistaken by some Muslims for a copy of the Kaaba and a

mockery of Islam. The problem was the black cladding temporarily used to protect the glass during the storefront's construction in late 2006; for with the cladding on, there was a resemblance between the under-construction building and the Kaaba in Mecca. That resemblance led to an online outcry (O'Meara 2018: 140-41).

I have written about this outcry elsewhere; for present purposes, what is interesting about the virtual storm the storefront occasioned is the fact that Apple's cube and Mecca's Kaaba belong to different visualities. In fact, a case could be made that these visualities are in a certain way opposites, the two sides of the same coin, such that perceiving the Kaaba in the storefront could hardly have been more wrong and yet also hardly more correct. My reasoning is threefold.

First, as the point to which every Muslim is instructed to turn and face (Q 2:144), the Kaaba is where sight ends. Sight vanishes in the Kaaba. The same is true of linear perspective. At what is called the vanishing point of linear perspective, namely, the point that anchors this mathematical systemization of the visual field, sight disappears.

Second, as the place in Islamic creation myth from which the world is said to have been born, the Kaaba is not just the Islamic world's axis mundi but also its matrix mundi (O'Meara 2021). The same is true of the vanishing point: from this point the modern scientific world was born, exactly as noted by Courbet (d. 1877) in his version of the creation myth, L'Origine du monde.[70] Courbet's infamous painting is, of course, not itself the birthplace of this scientific world, but its title names it and its irreligiously frank, objectifying and, to some, phal-locentric and exploitative viewpoint reveals its site-cum-sight (ur-sites constructing their sight) (O'Meara 2018: 147-52; Uparella and Jauregui 2018: 82ff.; Wigley 1993: 61). From this site, in this sight, with this viewpoint, nature is open to examination. Durer's woodcut of the reclining nude does something similar, albeit more coyly: the draughtsman possesses the objectifying viewpoint, not the viewer, who, as an extension of the draughtsman, possesses it at one remove only (Wolf 1990: 196-97). The viewpoint of Courbet's painting and the embedded viewpoint of Durer's woodcut reveal the sight of the modern scientific world. The linear perspectival construction of both pictures speaks of this sight's site, namely, the vanishing point outside of the view, which anchors the view, establishes the viewpoint, and owns the viewer who possesses this view-point.[71] In Bryson's words once more: "The vanishing point is the anchor of a system which incarnates the viewer, renders him tangible and corporeal [as] a measurable, and above all a visible object in a world of absolute visibility" (Bryson 1983: 106, emphasis in original).

"If we look closely," writes Baudrillard (2009: 10) with reference to the thought of Hannah Arendt, "we see that the real world begins, in the modern age, with ... the invention of an Archimedean point outside the world (on the basis of the invention of the telescope by Galileo and the discovery of modern mathematical calculation)." What Baudrillard here calls "the discovery of modern mathematical calculation" was made possible by the arrival into

medieval Europe of the meta-sign zero (Kaplan 1999: 106ff.; Rotman 1987: 13; Seife 2000: 78ff.). In linear perspectival constructions, a visual version of this meta-sign - visual zero - is the equivalent of what Baudrillard refers to here as the “Archimedean point” (Rotman 1987: 13-22). There is good reason to think that the Kaaba is the point’s architectural equivalent: tectonic zero (cf. Chod-kiewicz 2002-4: vol. 2, 23). Like visual zero, it is the anchor of a symbolic economy, namely, the symbolic order of Islam.

Third, these foregoing commonalities between the visualities that the Kaa-ba and the Apple storefront respectively belong to are also what divide the vi-sualities. As noted earlier, the Kaaba belongs to a visuality sutured by divinely proclaimed invisibility, al-ghayb; whereas the storefront belongs to a visuality that aspires to total transparency and absolute visibility. Both visualities can exist side by side in the same geographical location without that fact posing a logical contradiction; contemporary Mecca, with its modern planning and high-rise buildings surrounding and dwarfing the Kaaba is a case in point. In the modern-day museum, however, only the second visuality obtains. Recognizing that situation - teaching it - is the start of undoing it.

*** 8 Conclusion

As desirable as it would be to conclude this chapter knowing how to see the jinn in the modern-day museum, such a result was only ever very distantly on the horizon, the chapter’s title notwithstanding. The matter is beyond complex, and presumably for many if not most Muslims, also unnerving, with the goal being unwelcome because it is frightening. The goal of the chapter has realistically only ever been about establishing why it was necessary to create the conditions for the display of Islamic art so that the jinn could in principle be seen in the museum - so that the jinn and the unseen world, the ^calam al-ghayb, had a place there.

To be absolutely explicit, there is nothing wrong with the display of Islamic art in the museum as it currently stands. However, at a moment of academia when decoloniality is high on the agenda, asking how better to display art that belongs to non-Western visualities is a worthwhile question. Prescient as ever, Dale Eickelman has led us to this question. We now need some answers. With regard to Islamic art, my sense is that one answer will concern the fact that looking through windows onto carefully calibrated views, the principal activity of visitors in front of museum vitrines, was something only for the powerful and patriarchal in medieval and pre-modern Islamic urban culture. For those few people, the open (but unglazed) windows they looked through formed part of pictorially organized views (Arnold 2017: 36-121). For most other people, however, open windows at body height were rarely encountered, being generally screened. These screened windows did not allow looking through, but at best peering through, and were not part of pictorially organized views. As Ruggles (2007: 155-56) has noted, they additionally made one self-conscious about the act of looking itself: in confounding vision, they teased and drew attention to the eye. The

shadowy fissures these screens threw across sight are reminiscent of the jinn lurking in the shadowlands between visibility and invisibility.

** 5. Rethinking New Media in the Public Sphere: Beyond the Freedom Paradox

Jon W. Anderson

A paradox of the public sphere is that it implies structure without itself being that structure. For the philosopher and sociologist Jurgen Habermas, it was a regime of communication lodged in macro structures, of ritualized communication in dynastic and ecclesiastical structures and of formally “rational” communication which conveyed bourgeois ascendency (and, for Habermas, its realization in the technocratic state). Critiques of his formulation dwelt on people that it excluded - notably women and other social classes - and the problematic role it assigned to religion (Calhoun 1992); more significant has been his limited view of communication in constituting a public sphere - meaning shared and in the open among persons otherwise strangers rather than in known roles. Beyond defending his claims for “rational” communication (namely, that stands on its own), Habermas came around to respecifying the public sphere as “a network for communicating information and points of view” (Habermas 1996: 360), which still consigns how one emerges to largely historical-descriptive inquiry and a sociology of before-and-after comparison.

For the Middle East and Muslim world, the question of how a public sphere emerges has been subordinated to structural views of alternative sites and actors. Identifying new sites and actors was a first step (Eickelman and Anderson 2003), affirmed by much subsequent documentation of contemporary Islamic spaces (Bunt 2000, 2003, 2009; Graf 2007; Graf and

Skovgaard-Petersen 2009; Sisler 2011). In our New Media in the Muslim World (Eickelman and Anderson 2003), we presented romance novels, movies, satellite television, Internet portals, new legal journals, religious goods and community organizing as empirical sites where new actors - by comparison to traditional or existing and, by implication, establishment ones - advanced new interpretations in new media that organized and conveyed them. It has subsequently become apparent that new media have a deeper history and more extensive sociology in the Muslim world, from Sufis' quickly taking up new print technologies in the nineteenth century to Rashid Rida's discussing Islam in journalistic formats (al-Manar) at the turn of the twentieth century, to later circulations of sermons beyond mosque and madrassa on audio and video cassettes (Ernst 2005; Hamzah

2008, 2013; Sreberny-Mohammadi and Mohammadi 1994). But there is more here than proliferating alternatives or alter-natives.

First of all, communication is more than the passing of messages. Communication has context and genre, it registers identities of speakers and hearers, and it is intertextual and encoded. In addition to having more variables than Habermas considered, it is fundamentally interactive and emergent, extending and emerging over time and through interaction with myriad others. This is especially the case with new media, which are not finished products reproducing structural transformation but typically, and empirically, works in progress. Focusing on structural transformation, which opened the subject, ontologizes a utopianism in new media that leaves over data and flattens experience, which is precisely opposite the effects of new media. Beyond the gross fact of a public sphere, which can be problematic, is the prior question of how one emerges as a sphere of communication that comes to be shared and in public.

Understanding how a sphere of communication becomes shared, and in public is key to undoing the ontological utopianism in construing new media primarily as alternatives. Actors may imagine utopias, and may associate those with particular media and pursue utopias through new media, but these depend on how a sphere of shared meanings emerges and becomes both structured and in public - then as a public - in the first place. Here, I want to bring these processes better into view by aligning treatments of the Internet in the Middle East as new media with research on the Internet from elsewhere, and with the richer descriptive base that has accumulated. This is particularly the case with the advent of so-called "social" media (aka, Web 2.0) in the Middle East, which have outrun technical and functional concepts that are typically applied to it there too casually as alternatives.

*** 1 The Problem with Internet Media

Thinking about the Internet in the Middle East has overwhelmingly focused on two principal ideas. One, rooted in modernization theory, has viewed networked communications as revolutionary "technologies of freedom" (Pool 1983), increasing access to and flows of information. Manuel Castells (1996: 500) went on to characterize networked communications as the "material basis" of a "new social morphology" whose diffusion

“substantially modifies the operation and outcomes in processes of production, experience, power, and culture.” The other idea frames it overwhelmingly as media and operationalizes such structural transformation through comparisons to mass media. Both focus on decentralization of communication and on enhancements of agency as key structural transformations fostered by the Internet as a system of (more) open communication and by the Internet as media. But these essentially backwardlooking comparisons to industrial mass society can be deeply problematic, not least for ignoring other features of the Internet (as well as of communication more generally) beyond message-passing. A prominent example is the way stories and celebrations of digital revolutionaries conveying and amplifying, even helping to organize, uprisings in the Arab Spring (2010-2011) were overtaken almost as they occurred by debunking accounts that quickly carried the day. “The revolution will be tweeted,” enthused the web journalist and managing editor of Foreign Policy (Houndshell 2011). No, came back the vade mecum of an historian (Alterman 2011) with deep research experience in Egypt, it will not. Stories of young bloggers and Facebook revolutionaries (Aiello 2011; Che-bib and Sohail 2011; Faris 2012; Lotan et al. 2011; York 2011) quickly gave way to second thoughts on how the dynamics of the Internet’s new media fail to prevail against the static inertia of its authoritarian states and societies (Harb 2011; Lynch 2011), and think-tank projects were mounted to explain why (Aday et al. 2012; Zayani 2015). This is itself a familiar story about new media in the Middle East since television in the 1950s (Lerner 1958).

Such indeterminacies partly lie in how analysts and players share views and make the same arguments about media and politics. Players’ adopting analysts’ frames of reference - in effect joining and competing with them - puts analysis in the position of adjudicating players’ applications of the same body of ideas. Conversely, analytical conceptualizations of new media (as agencydispersing and agency-enhancing) become part of local knowledge in a shared search for “impacts” of new media through comparisons with mass media, understood primarily as message-passing and its outcomes. This epistemological problem compounds the ontological one in theorizing about media primarily as message-passing and focusing functionally on outcomes (or want thereof). So, an indeterminacy that creeps into media theory, which is already part of what it purports to explain, meets the over-determination of too few variables in that theory.

In anthropology, the epistemological side of this problem has been treated as how to position description where observer and observed use the same terminology, particularly in encounters in contemporary societies that collapse social distance into unmarked transparencies (Riles 2000). A way out of this conundrum is indicated in Eickelman’s (1992) essay on “Mass Higher Education and the Religious Imagination in Contemporary Arab Societies.” There, he identified religious imagination in terms of techniques rooted in a two-generation long rise in mass education, and particularly mass higher education, providing a new “intellectual technology” that was applied to thinking about Islam in more objectifying terms that modern education encourages than the hermeneutic techniques of mosque and madrassa. The insight is not that modern education is inherently superior (epistemologically), or inherently secular (ontologically), but that it became more widely spread than the textual literacy of the ^culama because mass education reached more people, and success in its type sites encouraged applying it to

others, notably religion. His finding was not that modern education led to secularism or diminished interest in religion, the standard interpretation since modernization theory. Quite the contrary: its social effect in that domain showed up and could be traced more immediately in “new ways of knowing and the emerging networks for communication and action produced by mass higher education and contemporary religious activism” (Eickelman 1992).

This identifies a meeting ground between structure and agency that aligns with the view that Habermas came around to, and that Emirbayer and Goodwin (1994) endorsed for combining structural with the more contingent data they called “cultural,” which bring agency into the analysis. Linking “ways of knowing” and “emerging networks for communication and action” helps in grasping that the Internet engages engineering, computer science, telecommunications, and extensive actor networks that brought those to general publics, to publishing, to imaginaries of “cyberspace,” the arts and creativity. Ways this proceeds are both increasingly pervasive and mostly out of sight for newer users, which is of intense concern to some (Mueller 2002, 2010). They are mostly evanescent as information, transient as performances and variously cast as a “second self” (Turkle 1984), new human spirit (Negroponte 1995), or the “new social morphology of our societies” (Castells 1996: 469). However, it is largely as media that the Internet has entered analysis in the Middle East, and then overwhelmingly through comparisons to mass media. In what has become the standard model, the Internet structurally provides a dispersed any-to-any model of communication that functionally provides freer flows and more diverse sources of information. Where mass media are concentrated and one-to-many, the Internet is non-hierarchical, open to anyone, a veritable space of freedom; and that register is enhanced in social media. But how? Testimonies and stories from bloggers, where available (Faris 2008; Herrera 2012; Kallander 2013; Pepe 2012; Radsch 2008; Shapiro 2009; Weyman 2007), typically begin with self-expression and keeping up with friends online in a space of their own. For technocrats who introduced it and businessmen who followed them online, it was developing services and, before that, developing the Internet itself (Anderson 2000, 2011).

These priorities and the broader range of activities are elided in comparisons to mass media and its communications theory from the Frankfurt School’s critical focus on production and American sociologists’ on outcomes to Stuart Hall’s semiotics of interpretation. These cast communication primarily as message-passing, and the main problem to be reception, measured as changes in knowledge, attitudes and practices, which has always been problematic. Focusing on message content and reception (registered as behavioral or attitudinal change) overlooks what people are doing even with mass media of broadcasting and publishing (Spitulnik 2002, 2010; see also Peterson 2010). A first step away from this limited conception of communication is aligning study of media more closely with its practices (Couldry 2010, 2012), which integrate additional data about how communication can be strategic, improvised, multiply structured, emergent in time, and situated - all of which are treated as externalities of communication conceived as message-passing and its “impacts.” Shifting attention to what actors are doing might introduce more about the speaker into what have been largely hearer-centered theories of communication concerned with getting the message through, and it might work for mass communications to re-center actors in a fuller range of practices. But this still falls short of what people are doing on the

Internet and through its various “ways of knowing and emerging networks for communication and action.”

Whatever people are doing on, with, or through the Internet - blogging, tweeting, chatting, surfing, hacking, shopping, searching or researching, playing games, writing or reading email, building websites, storing and accessing files, even computing - they are all interacting with and through computer-mediated communication in the form of programs. Computer-mediated communication is fundamentally interactive in two senses, or along two dimensions: one of interacting with others through media, which is foregrounded in so-called social media, and another of interacting with those media through manipulation, which includes learning from them about them, applying them to tasks and, in a sense that will be important here, continuing their programming. Common and recurring fears that users might somehow be absorbed - “addicted” is a common metaphor, isolated is another - in a mysterious cyberspace overlook how just the reverse is the case (Hampton and Wellman 2001; Nie 2001; Wellman 2001). A basic finding about life online is that even the most absorbed users do not retreat into cyberspace; they use it to extend their networks on their margins (from Toronto, see Hampton and Wellman 2001, 2003; Wellman 2001; Wellman and Haythornthwaite 2002; and from uc-Berkeley’s School of Information, see boyd 2006, 2008, 2010; Ito 2010).

Facebook and Twitter rose to fame in the Arab Spring uprisings as exemplars of Internet social media, which include myriad other programs that turn on user-contributed content from Wikipedia (and Google) on to others, such as Friendster, that have fallen by the way. Users first engage these and extend their social networks in a process or stages that proceed from lurker to newbie to adept to master and some to celebrity outside the field. They enter this process by learning from each other and peer mentoring, which proceeds through establishing relations and identity (reputation) with others in the field. The sites and social frames of these activities constitute what Lave and Wegner (1991) “communities of practice” through which informal learning proceeds as what they called “legitimate peripheral participation” by contrast to the more didactic routines and regulated attendance of formal teaching. Informal learning includes watching, sharing tips and tricks, and episodic mentoring among actors who come and go. Over time, these forms of participation that they unite as “peripheral” convert lurkers and newbies into adepts. Not to put too fine a point on it, the first form of interaction with and through social media - and, I would argue, with the Internet generally - is learning on it how to use it, which is primarily from others. This fact has typically been elided in thinking about communication as message-passing and, in the Middle East, by focusing on blogging, tweeting and Facebook as political cyber-activism from journalism to mobilizing through social media.

Such casual comparisons elide how their practices develop or collapse development into individual effort. They elide not just how people learn, but how they learn from each other and in what social settings. But not always. In an account of Egyptian bloggers who played roles in the Kefaya and the April 6 Youth Movement well before the Arab Spring uprisings of 2011, Courtney Radsch (2008) described the prior emergence of what she called a blogger elite, which had grown around experimenting with and networking through blogs and ties

among techies ranging from Linux developers to website designers who formed communities of practice through peer learning, sharing tips and tricks, and informal mentoring. From this base, and to it, came activists with backgrounds in Egypt's long history of labor protests and quasi-parties and others, sharing objections to rising economic inequalities and shrinking opportunities under the Mubarak regime's marketization policies that benefited only a few. In her arresting phrase, "bloggers became activists and activists became bloggers" (Radsch 2008). Among the latter, the Muslim Brotherhood built an online presence, while an example of the former might be Esraa Abdel Fattah, who worked for a dvd publisher and created a Facebook page for the April 6 Youth Movement. She had originally joined Facebook to keep up with her friends and then joined groups for fans of Egyptian singers and the national football team as well as others from discussions of the Qur'an to the latest styles. She used the accumulated expertise of this experience to create an April 6 Facebook page with an activist partner, became widely known even among people not using the Internet as the "Facebook girl," and was arrested. Upon being released from jail and publicly recanting, she was ostracized by political activists who took over the page, changed the password and excluded her from it (Shapiro 2009). In other words, a sympathizer brought her technical expertise to more politically engaged actors with less of it. For her part, she added another domain to her online activity.

These extensions exemplify what sociologists call "weak ties" that sustain one relationship but not many (Granovetter 1973) that became apparent when the activists subsequently excluded her from the very Facebook account she had created. By comparison, "strong ties" of close friends and family are multistranded, such as had come to be the case among Radsch's blogger elite who had been interacting and collaborating for years on using the Internet from its technological sides to connections with the arts. Two things are worth noting here. First, the initial draw of the Internet is more commonly for personal expression and interacting with friends, including interacting around the technology, than for political expression and activism (Ogan and Cagiltay 2006; Weyman 2007),[72] which more typically began in defense of blogging after police begin arresting bloggers (Haugbollle 2007). Second, among both techies and non-techies, the first community that forms among bloggers is around blogging as an activity in and of itself (Amr 2008; Taki 2010; on Lebanese bloggers and their pathways, see Haugbolle 2007; Jurkiewicz 2018).

In this case, underlying networks of strong-tie nodes linked by weak ties to others coalesced among techies, hackers, bloggers, Linux programmers and open-source software advocates, web designers, and website developers around a "culture of the net" before the Arab Spring, when they provided some of the connective tissue of Radsch's blogger elites and their links to political activists (Pollock 2011; Valeriani 2011). Among them, Augusto Valeriani identified practices of participation, peer-production and "remixing" in overlapping networks forged around "values, behaviors, skills and strategies that define the cultural dimension of the web" and that provided "connective leadership" in the Arab Spring demonstrations (Della Ratta and Valeriani 2012). The significance of this coalescence, beyond Valeriani's careful documentation of the network ties, is the reflexive consciousness of a "culture of the web" applicable outside the Web that emerged through interaction on and over these very technologies and built collaborations into trust around expertise and reputations for managing that expertise and those collaborations. Thus, from otherwise lightly organized

communities of practice emerge what Christopher Kelty in a study of open-source software developers called “recursive public spheres” (Kelty 2005, 2008). Kelty linked consciousness as a community to working on its means of production - in his case, open-source software - as an explicit alternative to existing regimes - in their case, proprietary commercial software. The value and pertinence of Kelty’s work goes beyond affirming Valeriani’s “culture of the net” to placing it in a network of specific social relations. Key here is the emergence of self-identification in a community of practice as a community of distinguishing practices, where community emerges out of collaboration and is enacted through that collaboration - more specifically, through practices that unite intellectual technology and the emerging networks of communication and action that convey its practice.

Kelty’s recursive public spheres and Valeriani’s networks focused by and on a culture of participation, peer production, collaboration and remix practices, are strong forms of Lave and Wenger’s communities of practice such as underlay Radsch’s blogger elite. Viewed comparatively, they display an evolution from reference groups (categorical identities shared by people who watch but do not necessarily interact with each other) into communities of practice through interaction (particularly learning and sharing), and on to Kelty’s recursive public spheres that focus consciousness of membership in a group on sharing and actively extending its means of production. What makes Kelty’s the stronger form is that while members of communities of practice come and go and pass from lurker to newbie to adept to master (and some on to celebrities beyond the field), participation in Kelty’s recursive public spheres focuses on sharing the development of its means of production or, in Eickelman’s term, “intellectual technology.” While Kelty is careful to avoid generalizing beyond the case of open-source software developers, he does aver that the notion could be projected back on the Internet itself, which also developed as an alternative to an existing regime of communications in cobbling together its intellectual technology and an intense focus on its means of production (Braden et al. 1999; Leiner et al. 2009). That development proceeded from assembling component technologies from multi-user, multi-tasking, networked computing to assembling the cultural surround of finance, regulation and support for the Internet project (Abbate et al. 1999; Hart et al. 1992), then extending it from the engineers who created it for their own work and around their collaborative work habits and values to scientists, other academics, the professionals they trained, and thence to the publics those professionals served.

*** 2. How the Internet Is Interactive

Arguably, the Internet has been interactive from its beginnings, and in three foundational ways. In addition to learning on and through it, the Internet was built to be interactive. Specifically, it was built as a collaborative project for other collaboration, and then extended by programming ever more user behavior into its “stack.”[73] It has never been a single technology but always a congeries of technologies, starting with time sharing, interactive (instead of batch) processing, and networked computing. Its original design incorporated these technologies and added others from signals processing to new software. The creators’ initial purpose was to establish a single, open platform for interaction with distant (and disparate) machines, to which the first addition, email, added interaction between their

operators (in the first instance, about the machines). The original concept extended the underlying design of all modern computers as general-purpose machines that could be programmed to do anything to a universal network of (potentially) all machines. This underlying design and its early extensions in newsgroups and listservs for collaboration are largely unknown and irrelevant to users who were introduced to the Internet in its later iteration as the World Wide Web, originally an application for linking research material that morphed into a publication medium through its first native application, the portal. What are today called “social media” were retrospectively conceived as extending the limited interactivity of Web portals to social transactions (O’Reilly n.d.).

Among the first but not the first to become famous as specifically social media in this sense were weblogs or blogs, which took the diary form online and made it interactive by adding facilities for reader comments and distribution by links to other blogs and sources of information. Prior to blogs were precursors of Facebook, starting with dating sites that, with Friendster, came to be identified as social networking (boyd 2008; boyd and Ellison 2007), and subsequently Twitter, initially cast as mini-blogging. While lumped together and with an array of similar programs characterized by “user-contributed content” (O’Reilly n.d.), such as Wikipedia, there are significant differences in how they accumulate and distribute information interactively. Blogs are organized as serial entries (posts) that may or may not be accessible to any Internet user but universally include a facility for linking to other blogs (as well as to other sources of information) and so may take the form of extended conversations, which typically start with groups of friends. Twitter is both more telegraphic in format and distributed by subscription to topics and following those who tag them, taking the form of a multi-user game of recognition management (Heffernan 2011). Facebook takes an intermediate form of shorter entries accessible to subscribers (friends) who may comment on or simply signal recognition (likes) of postings on each other’s sites (wall) on which their actions and interactions with others are registered. Each features user-contributed content, which they share with the interactive production of Wikipedia, and distribution through user-constructed networks (blogroll connections of blogs, friends on Facebook, followers on Twitter) that distinguish them from the broadcast distribution of mass and print media. Reception, here, is not just a matter of being in a stream of messages but positive interaction that leads to others with and then through these programs that run from signaling through more extensive exchanges to collaboration. They are all based technologically on contentmanagement software back to the Web on which they are stacked.

Taking Facebook as the central example and a point of comparison, research has consistently shown that users, and particularly youth, almost never go “on Facebook” alone but almost always with friends and typically to join friends (boyd 2006, 2008, 2011), and then selectively extend those nodes through weaker ties to friends of friends or through some elective affinity.[74] The result is high interaction, strong-tie cores with weak-tie links to others through individual members, such as the tech-adepts described by Radsch and Valeriani might have with friends in other networks. Likewise with blogs: few attract many readers, and most attract none or vanishingly few on their own (Shirky 2006). Instead, they acquire readers, or at least connections, through links (via blogrolls and rss feeds) to and from others; so each blog is a node in a network of links, some with densely overlaid (strong)

ties marking regular interaction, others of single (weaker) links marking occasional interaction or mere recognition. In either case, weak ties become stronger through regular exchanges that expand a relationship to more people in a node and by connecting to additional subjects. Twitter users likewise choose to follow topics or individual posters and to post to them, which theoretically could take the form of a massive conversation but is more immediately like a strategic game of attracting attention among imagined followers (Heffernan 2011). Each differently prioritizes interactions, which users may repurpose or extend. Some examples are the activists that Radsch describes who turned Facebook's posting personal "news" about "friends" into a bulletin board for political mobilization, the bloggers Valeriani describes who turned ties with digital freedom and human rights organizations into activism (Pollock 2011; Stolberg 2011), or the way in which Twitter, along with its visual counterpart YouTube, was repurposed to pass news to wider audiences that were in the habit of seeking information on them instead of longer-form mass-media platforms. (See Tusa (2013) for an interesting comparison of the communicative properties of the prominence of blogs in articulating senses of grievance to Twitter's shorter-form for getting out information about demonstrations.)

This network structure of weak-tie links and strong-tie nodes is robust sociology first developed in studies of job-seeking (Granovetter 1983) which found that close friends and family provided less help in finding employment because they essentially shared the same and limited information, while friends of friends and more distant acquaintances, interacting only occasionally and sharing little, had different information.[75] Put differently, strong-tie networks are characterized by high informational redundancy - the same thing over and over, as in families - compared with weak-tie networks that link bits of information not already shared to dense and more comprehensive strongtie relations. The significance of this structure is how it distributes information - more affirmation than information in networks of strong ties, with new information entering via weak ties to others. The communicative profile in strong-tie networks comes to resemble ritual that affirms solidarity - it forms rather than informs - while what passes through weak ties is, literally, news.

This distinction helps to identify the development of interaction in communities of practice as expansions of single-stranded weak ties into multistranded stronger ones. If their stronger forms are recursive public spheres, then the weaker forms are merely reference groups of "people like us" but who do not know or interact with each other to affirm that. Informationally, the significance of weak ties is that people learn something new through them and by shifting from passive to active learning - or, in the digital vernacular, from lurkers to newbies. In a community of practice, it is not the community they first learn about but what the community knows, which they learn through informal peer learning, mentoring, sharing tips and tricks that may develop into more extended collaborations, which expand weak ties into stronger ones, eventually of a recursive public sphere. Thus Radsch and Valeriani's data indicate actors who belong to multiple nodes with disparate weak-tie links between them through which new information, skills and learning flow that turned bloggers into activists and activists into bloggers. Valeriani makes the further point that the habitus of such outreach was developed, learned - and improvisationally, rather than formally taught - in tech adepts' communities of practice that assembled heterogeneous skills and knowledge into collective identities. Such communities may assemble cores of adepts whose continuous

and focused interactions forge bonds of familiarity and trust in the form of reputations as well as their shared expertise. Such would be Radsch's blogger elites, to whom activists loosely connected to them turned for their particular knowledge. Such a community of practice emerges in practice as a hierarchy of insiders, peripherals, passers-by and outsiders who bring weak ties to other nodes that pass additional information. The currencies of these informal settings are participation, expertise, and cultivating reputation for it, then claims to "universal" values that transcend more specific local values of ontological communities or represent themselves as an underlying "culture of the net" (Dean et al. 2006).

Interactive media provide sites or platforms of this habitus for interacting with media (as objects) and for interacting through media (as subjects). What began in each case as sociologically rather primitive instantiations (engineers' design parameters for automating information distribution) are broadened by adding higher-level interactions and through continuous learning. What makes them interactive in the first instance is learning programmed routines and facilities, to which sociologist Barry Wellman (2002) applied the concept of "affordances" from the field of human-machine interaction for action possibilities designed into machines in preference to stronger conceptions of determination. A commonplace of software design is that users typically employ less than the designed capacities of a program and often for purposes not designed into them, such as activist uses of Facebook and YouTube for political mobilization in the Arab Spring (Lewinski and Mohammed 2012). From the Internet's beginnings, programmers have encoded progressively higher levels of interaction by turning applications, such as the World Wide Web invented for linking information "on the run" (Berners-Lee and Fischetti 1999) into platforms for programs engaging additional user-contributed content. Interaction that begins with the machine and moves to its operators continues through their user-contributed content, which is not just about users' social relations

but, in the form of social media, increasingly more of the substance of higher order interaction through machines.

*** 3 The Social Life of Information

If interactions with and through media begin with learning techniques and in networks formed with them, how does this work? Engineers tend to project outcomes (connection, collaboration, information-seeking) as design features and political analysts to concentrate more on externalities. To square these circles and capture the sort of activity that Radsch characterized as bloggers becoming activists and activists becoming bloggers or Valeriani found in the extensions of heterogenous networks, Lawrence Lessig (2008) borrowed the concept of "remix" from music. Apart from a postmodern nod to creativity, the concept goes little further than modernist metaphors such as diffusion of innovations (from one place, site or activity to another), favored in political communications studies (a recent example being Howard 2010) to link information flows to interactions that convey them. Viewing communication interactively shifts the problem from what messages add to recipients to

what is added to move messages through weak-tie links into nodes of strong ties where they come to carry additional information.

This process is known in linguistic anthropology as “entextualization.” In one of its type sites, Joel Kuipers (1990) described it as the establishment of “textual authority,” by which he meant that highly situated, deeply contextualized, personal information is progressively recast into more general, more shared, abstract or categorical terms. Examples could include medical diagnosis, or police detective work that assemble bits of disparate information into meaningful units; his site was a process of divination in which a specific individual complaint is successively recast into a diagnosis, a passage from having to know the context to knowing the code. Its “textual authority” confers what boyd and Ellison (2007) identified as the permanence and transparency of information on social network sites where users construct profiles, build their networks, and record comments on each other’s that float free and independent from their original settings. What Kuipers points to is not reinterpretation (change of meaning), but change of register from highly contextualized, locally and temporally contingent information to more portable, abstract categories that contain general values and evoke what is at stake. In a specifically media context, Swidler (2001) refers to such categories as “anchors” of significance in authoritative representations and enactments.

Something like the entextualization process that Kuipers located in a stepwise ritual process - its resolution of ambiguities, multiple local meanings and especially conflicts - can be seen also in the refinement of myriad individual grievances that connect diverse single incidents into an authoritative text, master frame, or anchor such as emerged in the Arab Spring demonstrations between December 2010 and February 2011. Between the April 6 Movement in support of a workers’ strike in 2008, the Kefaya movement four years earlier, and 2010, accumulating grievances over unemployment, the combination of crony capitalism and shrinking economic prospects, police brutality, particularly against bloggers who exposed it, and ire over the prospect of a Mubarak-son succession filtered through the Egyptian blogosphere and coalesced in a smaller group of authoritative texts that united many single incidents and personal experiences. One was the Facebook page, “We are all Khaled Said,” created in June 2010 to commemorate a blogger who, after posting a video of police misbehavior, was dragged by them from an Internet cafe and beaten to death. Graphic images were posted and reposted on Facebook pages, YouTube, and blogs that literally put his battered face on what was wrong in Egypt (Lim 2012). The Facebook page was created by a co-founder of Wikileaks Arabic, Abdelrahman Mansour, who had brought skills developed as an online reporter for Al-Jazeera and on the website of the popular television preacher, Amr Khaled, and by Wael Ghonim, a Google marketing executive with whom Abdelrahman had worked on the Facebook page for opposition presidential candidate Mohamed ElBaradei (Herrera 2013). Mansour also created another Facebook page, Thawrat Shaab Misr (Egyptian People’s Revolution), in early 2011 to turn a national holiday commemorating the police into more generalized protest against them that, through street demonstrations, coalesced heterogenous activism into a broad, inclusive demand for the end of the regime.

Mansour, a media activist since his student days and former adherent of the Muslim Brotherhood, marks these connections explicitly as transitions in his account quoted by Linda Herrera: “I wanted to be part of a broader movement, something bigger than the Brotherhood. I wanted to continue working but not necessarily by belonging to one party or a single organization.” His example aligns the sociology of network flows with the sociolinguistics of entextualiza-tion that connect separate experiences into one: the flows are not or not only of messages from one network to another but of individual bits into shared texts (“memes” in some media theory) that give those individual experiences a shared anchor. This is what Hirschkind detects in the Arab Spring as “a new political language that cuts across the institutional barriers that had until then polarized Egypt’s political terrain,” and developed specifically in the Egyptian blogosphere as “a political language free from the problematic of secularism and fundamentalism that had governed so much of political discourse in the Middle East” (Hirschkind 2011). In other words, he was essentially restating Mansour’s point and drawing out its un-spoken implications. Other elements in this particular conjunction in the blogosphere include collaborations that grew among Egyptian and Tunisian bloggers between the fall of Ben Ali in Tunisia and Mubarak in Egypt (Kirkpatrick and Sanger 2011; Pollock 2011); online and other consultations with Otpor, the anti-Milosovic youth movement in Serbia; studying social media use in the 2009 Iranian Green Movement (Is-hani 2011); and training in non-violent protest tactics allegedly adapted from an American activist (Shane 2011; Stolberg 2011), which had spread online and as a pamphlet subsequently reproduced in The Atlantic (Madrigal 2011).

This is far beyond Lessig’s remix. Its underlying pattern is passing little local stories (what’s happening to me, now, here) into bigger general ones (what’s happening to us, our time, the world) that acquire the authority of shared meanings to anchor individual experiences in values that unite what is at stake. What seems to happen is entextualization passing through network dynamics where specific, individual experiences (I can’t get a job, afford to get married; a blogger was beaten by the police; the president wants to install his son as successor) congeal in nodes of strong ties that focus on those ties (the police are beating bloggers; the government is un-Islamic; the regime is undemocratic; the economy is failing to generate employment) and feed through weak links between them into a master text that could be shared between them and more widely, as in the slogan, ash-Shab yurid isqat an-Nizam (“The People Demand the End of the Regime!”) that condensed the grievances of demonstrators in Tahrir Square (and in other countries).

For the middle parts of this process, Ethan Zuckerman (2008) applied the term “bridge bloggers” to actors who actively forge such connections, who cast their messages in the terms, for instance, of human rights or net-freedom campaigns, or obversely are sought out for moving local experiences into more global categories because they have ties in both.[76] In this sense, entextualiza-tion may be strategic, actively pursued in a field of contending interpretative performances, as well as a cumulative process of restatement, such as in the intervals between the Kefaya and April 6 Movement and those of the Arab Spring. So, we have three analytically distinguishable kinds or sites of entextu-alization - the ritual process that is Kuipers’s type site, a cumulative process over an extended period of increasing interaction, and a strategic version that is reflexive.

These analytical types describe a hierarchy of interactivity that instantiates a public sphere (and stratifies participation in it) from the relatively passive (reference groups, lurkers), through the tentative and transient (communities of practice, newbies) to the recursive (entextualization in the hands of master spokespersons) that link the socialization of users to the design functions of programs on the one hand and to the socializations of their uses into more comprehensive registers on the other. Such progressions underlie the incorporation of user behavior into computer programs, which users further extend with their own programming. That process has been implicit in the Internet from its beginning and has become ever more explicit with new social media. User-contributed information is not new: all information on the Internet is user-contributed by design, since its engineers created it for their work. Web portals arrayed it as networks; and social media made the incorporation of user-contributed content both explicit and reflexive in the applications that model user interactions and that invite them to extend the process with more interactions.[77] Viewed as a process and not an outcome, the sequence begins with learning about and through interactive media and proceeds by extending its uses through what sociologically amount to elective affinities. Sites of these processes are communities of practice, in which information is consolidated into shared understandings. Information in this sense does not diffuse, it coalesces through networks of weak-tie links in strong-tie nodes by entextualiza-tions that give it denser and more general registers of value, which, in network terms, consist of shared knowledge of individual nodes compared with the bits of information that are passed between them.

*** 4 Intermediate Conclusions: How Do New Media Expand the Public Sphere?

The formula of new interpretations by new interpreters in new media forging, or at least fostering an emerging public sphere, was adequate when Internet media and studies of new media in the Middle East and Muslim world were themselves new, but is now increasingly showing its age. It has neither kept up with a growing empirical record, not least of sites, nor have comparisons with the older mass media overcome their fundamental limitation of viewing communication as outcomes (impacts) of the passing of messages. Most fatally, such comparisons engage limited aspects of the Internet because the closer one gets to real social action, the more likely it is that the media, nearly always the political media, and its message-centric view of communication, will produce indeterminate results. Filling in the outlines of new interpretations, new interpreters, and new media has documented an emerging public sphere, but one that remains under-developed insofar as communication is primarily theorized as message-passing and the Internet primarily as media.

That becomes harder with social media, which foreground an interactivity that was always in the Internet and which social media make plain by shortening the cycles and expanding the scope of interactions through it. Interaction starts with learning and extends through communities of practice that share knowledge through networks of weak ties which pass information and consolidate knowledge in nodes of strong ties that refine it into shared, public understandings. It entails more middle range phenomena, such as are highlighted

here. First are communities of practice where knowledge is shared through layers of participation by actors who come and go but, unlike reference groups, interact with each other. Theirs is at least partial, part-time or “peripheral” participation, which may scale up to more intensive and reflexive participation central to the purpose of a group, such as Kelty found among Linux geeks and may be the case with some blogger networks that become intensely focused on blogging itself. Second are networks of weak ties through which information (knowledge) passes to nodes of strong ties where it is refined into shared understanding. Third is the sociolinguistic process of entextualization whereby highly specific and deeply contextualized information is recast into more context-independent or abstracted understandings that can circulate unaided. This entextualization may unfold as a ritual process, or cumulatively over time through increasing interaction, or as a reflexive strategy of turning individual experience and knowledge into social experience and knowledge that is shareable, has general value, expresses identity as a group, and consolidates in symbols.

If new interpretations by new interpreters using new media identified the structural transformation of an emerging public sphere in the Middle East and Muslim world, communities of practice, networks of weak ties linking nodes of strong ties, and entextualization provide a clearer picture - and a less interested account - of how this emergence continues through interaction on and incorporation into the Internet, which projects reference group phenomena into the public sphere. This has two benefits denied to views of the Internet as media and limited to message passing and agency enhancement. Both agency and messages are transformed, in a sense of becoming not only more public but also more reflexively coherent, through normal practices (sharing, abstraction, reflexivity) by which communities of practice grow and entextualization proceeds. Second, bringing these into focus takes advantage of a much enlarged and more diversified descriptive base to look past initial assessments, which were framed primarily as exceptions, to a more normal sociology comparable with what research elsewhere is showing about how the Internet actually shapes the emergence of a public sphere. A remaining question is whether and where the magic of media to extend characteristic forms of interaction in small groups and networks conveys intimacies and immediacies that similarly scale up.

chapter 6

** 6. New Moroccan Publics: Prisons, Cemeteries and Human Remains

Susan Slyomovics

Under extreme conditions, the acts of writing,[78] witnessing, and speaking are carried on as a last resort - not to communicate among disparate audiences, but rather as desperate gestures into the void. As innovative origins for the public sphere, I consider the ways in which the acts of last resort that emerge from open cemetery graves and closed prison cells resituate emerging Moroccan public spheres and plural democratic vistas. Thus, this enquiry extends anthropologists Dale Eickelman and Jon Anderson's (1999: 1-2) descriptions of "an emerging Muslim public sphere ... situated outside formal state control ... at the intersections of religious, political and social life." Accordingly, the public sphere expands exponentially towards a metaphorical, imaginary, visual or even a moral space as well as an actual bounded physical place, or in their words (Eickelman and Anderson 1999: 1-2):

Facilitated by the proliferation of media in the modern world, the Muslim public can challenge or limit state and conventional religious authorities and contribute to the creation of civil society. . This combination of new media and new contributors to religious and political debates fosters an awareness on the part of all actors of the diverse ways in which Islam and Islamic values can be created and feed into new senses of a public space that is discursive, performative, and participative, and not confined to formal institutions recognized by state authorities.

The complexities and modalities of the public sphere, viewed through examples of several generations of Moroccan political prisoners in discursive, performative and participative

modes, underpin a vast social sciences literature on resistance, human rights, and what Eickelman and Anderson termed “boundary crossings of these messages” and “asymmetries between senders and receivers, and between producers and consumers” (Eickelman and Anderson 1999: 4). It is the Habermasian space of communicative action (Habermas 1984-1987).

Moroccan historical contexts for asymmetries in communicative action point to the prison and cemetery framed by French colonial control and normalized as the perpetual state of emergency (etat de siege). This began in 1914 and lasted until the end of the French Protectorate, the year of independence in 1956 (on consequences of the state of emergency, see Agamben 2000). The next phase saw these various instruments of repression - laws, penal bureaucracy, the police and prison system - indeed, an entire apparatus built by the French Protectorate to oppress Moroccans, and operationally Moroccanized: what allowed the French to control, dispossess and oppress Moroccans would permit Moroccans to do the same to Moroccans through the uninterrupted use of the government decree or dahir that legislated for impris-onment.[79] In both colonial and independent Morocco, a legal edifice specific to the worlds of political prisoners derived from several such decrees: these were the dahir of 8 August 1930, which created the category of political prisoners separated from ordinary prisoners (droit commun) to exempt them from forced labor and divide them according to Protectorate distinctions between native and Europeans; the dahlr of 29 June 1935, which mandated prison for demonstrations and actions to disturb order, peace and security; and the dahir of 26 July 1939, which added phrases to prohibit making, distributing, and selling tracts.[80] The post-independence Moroccan authorities inherited and exploited the apparatus of the French Protectorate to condemn large numbers of Moroccans for non-violent crimes of opinion. These mass arrests and trials with lengthy prison sentences were evidence; they automatically designated for international human rights organizations, such as Amnesty International, the category of prisoner of conscience. Not until 1998, according to Law 23/98 on prison reform enacted by the Moroccan parliament (published in the Bulletin officiel as the decree of 25 August 1998), did the first major reorganization and recategorization of the French-inspired carceral system break definitively with Protectorate decrees. The new laws of 1998 governing the status of political prisoners appeared just before the death of King Hassan ii, whose lengthy reign from 1961 until his death in 1999 is often referenced as the Years of Lead, due to mass repression and incarceration.

If these laws represent political asymmetries between the producers of state sovereignty and governmentality through the disciplinary institution of the prison, then political prisoners are the presumed receivers as subjects to be isolated and punished. In this chapter, I consider examples in which Moroccan political prisoners breached the confined spaces of the state-controlled cell and the cemetery through “discursive, performative, and participative” modalities adumbrated by Eickelman and Anderson. Focusing on the post-Hassan ii historical turning point, I return to 1999-2000 when, funded by a year-long Fulbright fellowship, I conducted numerous interviews with Moroccan political prisoners. These encounters occurred in public spaces newly opened to overlapping communities of political prisoner associations and human rights organizations.[81] Here, I am especially indebted to Marxist

former political prisoner Mohamed Srifi (who endured nineteen years of political detention mainly in Kenitra Prison), for offering me his radical perspective (during an interview in Tangier on 2 July 1997), which was at odds with descriptions of Moroccan imprisonment. He believed that a Moroccan prison may function as a university where human rights are nurtured because, paradoxically, this was the only free space in his country during the Years of Lead. Prison as a university is especially apt given that a heterogeneous population of Marxist, Amazigh nationalist, Islamist, and Sahrawi students had been thrown together in the cells of Kenitra Prison, Morocco's pre-eminent penitentiary. That political prisoners established vibrant worlds in which clandestine journals were published, meetings held, and messages sent outside and abroad has been amply documented historically and cross-culturally. Literary critic Simona Livescu (2011: 185) described the political prisoner's "spiteful euphoria" (a term she borrowed from a Soviet gulag inmate) and the ways in which their "abrupt initiation into prison happiness, at times individual and at times collective, infuses political prisoners with unique civic values that reverberate in their communities after release." Having demanded that their jailers, torturers, and politicians adhere to international human rights norms, once released into the population, she concluded that the political prisoner's so-called happiness was contagious.

As I look back twenty years to the serendipitous political and personal fieldwork conjunctures of 1999/2000, which included Hassan ii's death, his heir Muhammad vi's enthronement, and my joy at witnessing an apparent end to the Years of Lead, in hindsight I note unexpected outcomes of an enforced prison education. Generations formed in prison were armed with knowledgeable analyses and organizational abilities that did indeed reach wider publics. The events of the year 1999/2000 caused me (Slyomovics 2012) to ask where do Moroccan claims to the public sphere about prisoner and political rights begin? Is it from inside the prison or at the cemetery, and how does one document these intimate and emergent processes ethnographically? Despite regimes that criminalize all manner of cultural activities, censor literary productions, and control the sociability of cafes, Internet networks, national demonstrations, and local meetings, in what follows I discuss the avenues available to political prisoners for getting the word out.

*** 1. The Photograph an] d the Prison Cell of Islamist Political Detainees[82]

Consider this clandestine prison photograph in which two, possibly three sets of arms appeared from behind prison bars.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-9.jpg][Figure 6.1 Clandestine prison image photographer unknown. gift from khalid bakhti. author's collection.]]

Limbs seemingly detached from their owners configure the letters "A" and "I" to stand for Amnesty International. A fist on the viewer's right is raised high in the international gesture of struggle and solidarity to grasp a single red flower dotting the letter "I" above the arm.

Incised along the horizontal cell crossbar that locks inmates out of sight are prison graffiti to caption the staged photograph: “Detenus d’opinion Groupe 26 Oukacha” (Prisoners of Conscience Group 26 Oukacha). These arms belong to three political prisoners incarcerated during the decades of mass political trials in Morocco in which affiliations to socio-religious movements were effaced to reorganize groups of political prisoners according to the numbers arrested followed by the date of their trial. The designation Group 26, 2 September 1985 trial, refers to the twenty-six Moroccan Islamists in Casablanca’s Oukacha civil prison, who were arrested in 1984 for non-violent crimes of opinion and who proclaimed that they were exercising the “moral economy of protest” in the public sphere. (On cyclical uprisings and bread riots in the public sphere being “disciplined and with clear objectives,” see Gallisot 1989 Thompson 1971: 76-78.)

Their so-called crimes occurred during Ramadan at the hour of breaking the fast on 20-21 June 1983. Groups hung posters and painted slogans around beach and port areas, in the town center, and on highway overpasses to commemorate the anniversary of the 1981 Casablanca uprisings in the towns of Mohammedia and Casablanca, in the neighborhoods of Sidi Bernoussi and Ain Sebaa. Former Islamist political prisoners described these acts to me as the politics of tahaddl (or def in French), ephemeral public resistance. Calligraphy and posters, largely the work of activist artists Khalid Bakhti and Mohamed Hakiki, were deliberately designed to resemble election posters. Police swarmed the neighborhoods and quickly painted over wall graffiti, which then reappeared in the coming weeks. Some banners and posters were deliberate variants of leftist slogans decrying the lack of democracy and justice, the high cost of living, and calling for freedom of speech. When exhibited in court, Islamist-inflected slogans were incorporated into trial records and came to light: “if religion were installed in the country, there would be justice and human rights,” and “Hassan ii al-tagut,” a Quranic epithet for tyrant (Qur’an 4: 51, 60). Although their sole crime was to post anti-royal banners and graffiti, Islamists faced authorities who ramped up sentencing disparities with false accusations of fomenting Casablanca’s so-called bread riots (Darif 1999; Haou 1994: 13; Munson Jr. 1991: 331-44; Santucci 1985: 650-52; Tozy 1999). On 11 July 1984 when two men were caught covered in red paint in the town of Mohammedia, this was proof enough for police to have them forcibly disappeared inside Casablanca’s Derb Moulay Cherif torture center (Slyomovics 2001-2:53-56).

The trajectories of interrogation and torture that all Moroccan political prisoners shared reserved specific mistreatments for each category. According to my interlocutors, while the torturers forced Marxist-Leninist groups to recite the sahadah, the Muslim profession of faith, Islamist political prisoners were in turn prevented from performing ritual ablutions and praying out loud, on the grounds that their torturers defined these actions as a forbidden form of communication among themselves. Deemed especially dangerous were cases involving political prisoners accused of “threats to the security of the state” (atteintes a la surete de I’Etat) where incommunicado detention could be extended and, according to some Moroccan legal experts, construed as a period of unlimited duration meted out routinely to political opponents (Essaid 1971: 334, esp. n.57). Former political prisoner, lawyer, and activist with the Moroccan Association for Human Rights (amdh), Abderrahman Benameur, linked political imprisonment to nonauthorized views

emerging from any political act, whereby political acts interpreted by the state tarred so vast a group of activists as to constitute an absence of any semblance of judicial neutrality. He stressed that the continuities in social and political structures were rooted in the early years of independence that continued after independence and, as he (Benameur 1982: 3-4, 1983: 8-9) wrote in French and Arabic respectively:

Detention for political and union offences is not a contingent fact in contemporary Moroccan history, nor purely a series of provisional measures required by particular circumstances, nor a kind of extortion on the part of certain officials exercising the authority conferred by their job. On the contrary, detention for crimes of opinion, political and union activity is a method constantly used to destroy non-official opinion.

The state, in effect, having criminalized all manifestations of political activity and thought that promote l'opinion non-officielle also barred political acts such as writing tracts, painting graffiti, holding meetings, and demonstrating.

Figure 6.1, by contrast, is a visual and political riposte to the state because it presupposes someone outside the photographic frame, a photographer momentarily freed from his cell, with an illegal camera and the will and creativity to produce a symbolic, clandestine but factual document in 1992. Smuggled out of prison, disseminated to supporters in Morocco, and sent abroad to international human rights organizations, the photograph assumed that the very idea of a literate act is initially produced without an audience and only bare prison walls as company, unless one counts the torturers and prison guards. Never successfully silenced by the authorities, political prisoners saw themselves actively communicating beyond their prison walls in public debates about the future of Morocco. In this case, the urgent information to be disseminated involved Group 26 of the Islamist political prisoners proclaiming to be non-violent, thus supported and mentored by Amnesty International. After their arrest, an open letter (risalah maftuhah) was smuggled from prison with twenty-nine signatories affirming no affiliation with other existing Islamist groups such al-Sabibah al-Islamiyah, and proclaiming their commitment to non-violent opposition (La 'alaqah lana bi-munadammah al-sabibah al-islamiyah 1985: 6). A copy of the photograph was presented to me in 1999 during meetings in Casablanca organized by a human rights group for political prisoners headed by Driss Benzekri from the Marxist poitical group Ila al-Amam, and who until his death from cancer in 2007 served as president of Instance Equite et Reconciliation (ier), Morocco's truth commission (Sly-omovics 2005). While the photographer insisted on anonymity, Islamist former political prisoner Khalid Bakhti confirmed to me that he had been the subject and co-producer of the image, for which he used his own arms as part of the Amnesty International logo.

The passage of the political prisoners' pain, isolation, and torture into the realm of shared public discourse, no less than the ideas these prisoners espoused, drew on circulating photographs, reconfigured Muslim rituals, newspaper articles, and the performance of sahadah. In Morocco since the 1970s, the Arabic word sahadah

has come to express a prayer, an affirmation of faith, but also testimonio as defined (by Beverley 1989: 14) for Latin American literature:

The word testimonio translates literally as testimony, as in the act of testifying or bearing witness in a legal and religious sense ... in which it is the intentionality of the narrator that is paramount. ... [It implies] an urgency to communicate, a problem of repression, poverty, subalternity, imprisonment, struggle for survival, and so on, implicated in the act of narration itself.

Definitions of sahadah encompass a range of meanings from simply being present, to seeing events, to witnessing (Messick 1993: 161-63) and testifying orally, a continuum that unfolds semantically, experientially and publicly with greater intensity and purpose (Gimaret 1997: vol. 9, 201). The political prisoner as witness crafts the message in the form of photographs, eulogies, cemetery visits, and oral histories sustained by the authenticity of the carceral experience, while the implied audience changes as these occasions, images, and performances come to public notice. In this case, initial audiences were cellmates, widening to prisoner support groups and family members, then reaching international human rights organizations (including me, the foreign anthropologist) because the photograph is a genre of expression that is infinitely reproducible throughout the world. Properly contextualized, a photograph may inform, gather, and even create an audience committed to human rights for Moroccans inside and outside the country because it works artistically, its reception is politically explicit and subversive, and it reports on resistances that remain invisibly intimate and behind the scenes. Images educate as they too are forms of “intellectual technology or forms of transmission of knowledge available in a society to shape and accommodate social and political change,” concludes Eickelman (1978: 487). Another bonus is that powerful pictures transcend Morocco’s linguistic battles by choosing the gut punch of visuality, while eliminating discourses about the relative communicative values of the country’s Arabic, French, or Amazigh languages.

*** 2. The Cemetery Eulogy and Public Oral Testimony

Complex enactments of witnessing, testimony, political prisoner histories, and the history of Morocco’s radical left converged at a gravesite on Friday 31 March 2000 at Casablanca’s Martyrs Cemetery. Ritual burial practices were elaborated with innovative acts of political performance during the funeral of Brahim Meslil, nicknamed Hallaoui after his profession “the candy-maker.” Hallaoui’s body had been carried by cortege from his home to the Casablanca cemetery. His grave had been prepared and as he was lowered into the ground, the outline of his body, wrapped in a simple white sheet, was visible. Figure 6.2 depicts the crowd of activists, former political prisoners, and immediate family listening attentively to Mohamed Mehri’s eulogy, traditionally not delivered in the cemetery but in this case close to the shallow open grave displaying the shroud that bore traces of Hallaoui’s blood.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-8.jpg][Figure 6.2 Hallaoui’s interment, Casablanca cemetery, 31 March 2000 photograph by Susan Slyomovics]]

To Mehri’s right stands Salah El Ouadie, the poet and former political prisoner from the Marxist March 23 Movement who, on this atypical funerary occasion (Slyomovics 2002), is holding up a tape recorder, thus recognizing the role of testimony and witnessing. Funerals at Moroccan cemeteries are formal male ceremonies, so it was unusual that the women of Hallaoui’s immediate family, his wife and four daughters, attended and participated, although they only spoke at later commemorations (Guessous 2009).

In Figure 6.3, Meriem Meslil, one of Hallaoui’s daughters is holding aloft her father’s photograph, a powerful conjunction of her father’s portrait over his remains, while Mehri was narrating the trajectory of a militant Moroccan nationalist, a life in which the speaker himself was implicated (Figure 6.4). Mehri’s testimony gained power with each word uttered in this venue at that moment.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-7.jpg][Figure 6.3 Hallaoui’s interment, Casablanca cemetery, 31 March 2000 photograph by Susan Slyomovics]]

He performed the multiple roles of witness, actor, comrade and mourner to make urgent claims about rewriting the memory of Morocco’s contested and violent past history during the first decades after independence.

Mehri’s eulogy counters the primacy of the police report, a genre of authoritative essay writing that locates a political detainee in the specific historical and juridical context of presumed criminality.[83] There is always an imbalance of power between the written police documents of the authorities who incarcerate and the oral testimonies of former political prisoners who witness, for the latter represent performative forms of political opposition, perhaps even liberation from the prison spaces of surveillance.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-6.jpg][Figure 6.4 Hallaoui’s interment at the site of the gravestone photograph by Susan Slyomovics]]

I photographed and scribbled in my notebook the gist of Mehri’s narrative: Hallaoui had been born in 1935 in a small village near Taroudant in the Atlas Mountains. In 1942 at the age of seven, he had moved with his family to Casablanca, part of the massive influx of dispossessed rural southerners that fueled the city’s booming wartime industrial economy (Burke 1987; Clement 1992; Gallisot 1989; Le Saout and Rollinde 1999; Montagne 1952; Rachik 1999). In the waning years of the French Protectorate, Hallaoui joined the local Communist Party youth cell, attended its night schools and in 1948, at the age of thirteen,

participated in Casablanca street demonstrations against the partition of Palestine. In 1952, he switched his allegiances to the nationalist Istiqlal party, which the French had banned but which was operating clandestinely. Mehri recounted Hallaoui's pride at participating in the 1952 Casablanca uprising, one among many demonstrations repeated throughout the Maghrib in protest against the assassination of Tunisian union leader Ferhat Hached. Famously, Hallaoui claimed to be the first to decolonize by force the segregated Roxy cinema in Roches Noires, which barred entry to native Moroccans. By 1953, he had already been arrested and tortured by the French police for writing slogans on neighborhood walls proclaiming "Long live Morocco, long live Muhammad v" during the monarchy's enforced exile to Madagascar. Thereafter, Hallaoui took up arms and was active in Casablanca's urban underground resistance movement. After independence, he switched to the radical left political party, Union nationale des Forces populaires (unfp), under the leadership of Mehdi Ben Barka and Mohamed "Fqih" Basri, following the 1958 split from the Istiqlal party.

Mehri's eulogy on 31 March 2000 over Hallaoui's body in the cemetery followed precedents. On 20 December 1999, a scant three months before his own death, Hallaoui had spoken over the freshly excavated gravesite of Ahmed Jawhar, another comrade-in-arms known as Abaakil. Jawhar had been born in 1946 in the Tiznit region and migrated along with large numbers of Tashelhit Berber-speaking southerners to the city where, at the age of twelve, he became a worker in a Casablanca sugar factory. Again, Hallaoui provided oral testimony at a second public ceremony held at a public auditorium on 29 January 2000 to mark the arba'in, fortieth-day commemoration, of Ahmed Jawhar's death.

Twice he testified, first at the intimate and spontaneous cemetery eulogy, then in scripted testimonies about their shared political beliefs that had led them not only to take up arms against French colonialism during the Protectorate but also to continue the armed struggle for violent regime change after Moroccan independence. For the fortieth-day event, a memorial book in commemoration of Ahmed Jawhar's life, one of many examples in circulation of ephemeral printed programs accompanying written tributes at public performances (Figure 6.5), was distributed to the audience.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-5.jpg][Figure 6.5 Public venue for Ahmed Jawhar's commemoration, Casablanca, 29 January 2000. Photograph by Susan Slyomovics.]]

Each venue - prison cell, cemetery, and public theatre - and each medium and method - photograph, burial eulogy, public commemoration, memorial book - "undermine[s] the theatre of the state ... making evident the multiple connections of this expanding public sphere ... [to] offer self-consciously alternative forums for alternative voices" (Eickelman and Anderson 1999: ix-x). Performances in the public sphere, such as conferences, sit-ins, vigils, rallies, public testimonies, funeral eulogies, and commemorative days, invite critical reflection about the ways in which performance, coupled with new media, plays a role in wider socio-political contexts. Such performances are social practices deeply connected to

Moroccan history as attempts to uncover, write, and revise that past. To sustain the notion that the social life of human beings can be viewed through performance and new media, these accounts allow us to reconstruct mechanisms of abuse, with some attention to complex underlying social and political causes and contexts against which communal cultural enactments are composed. These new performance-oriented historiographical approaches relied on participatory structures, audience-speaker interactions, the role of the interview and public lecture as a genre, the status of speech as socially communicative action, and a community of political prisoners to create new understandings of living history. Notably, the eulogy and interviews illuminated the key roles of Jawhar and Hallaoui in what is known in Moroccan history as the revolt of Cheikh El-Arab.

*** 3. Tales of Cheikh El-Arab

Nicknamed Cheikh El-Arab or Chief of the Arabs, this was a man of many names and escapes from authority. Ahmed (or Hmad) Ben Mohamed Ben Brahim Bouchlaken, also known as Hmad Fouzi (or Faouzi), was born in Agouliz, southwestern Morocco, and died on 7 August 1964. A police ambush, orchestrated by General Muhammad Oufkir and based on a presumed betrayal by a member of Cheikh El-Arab's entourage, Ahmed Ouzzi, perhaps speaking under torture, unfolded in the Sidi-Othman neighborhood of Casablanca. Five months earlier, Cheikh El-Arab had escaped from both Oufkir and from a second prison sentence that had been pronounced in absentia. Condemned during the Rabat trial of 14 March 1964, he evaded this first mass trial, which had been notorious for creating large numbers of political prisoners in postindependence Morocco by incarcerating the leadership of the unfp political party, the main opposition to Hassan ii, alongside the remaining armed cells of the Armee de liberation nationale (ain), the national liberation army also known as Jays al-tahrir. After a gun battle in Casblanca's Derb Milan neighborhood, Hallaoui, outnumbered and surrounded by police, exited from his safe house firing his guns and was felled by a police bullet to the leg. Hallaoui's 1999 tribute to Jawhar recounted that Cheikh El-Arab chose to commit suicide with his last bullet rather than be taken by the forces of repression. According to an apocryphal version by French journalist Gilles Perrault (1990: 82-4), Oufkir sought Cheikh El-Arab alive but when at last they faced off, Oufkir was told: "You wanted me alive, I regret I have only one bullet but it's for me."[84]

Who was Cheikh El-Arab? Who belonged to his group? And how should one understand the first decade of Morocco's independence (1956-1964), given that cemetery eulogies, testimonies and representations are subjecting its history to revision in 2000, the year after Hassan ii's death? Popular tales about Cheikh El-Arab endure despite official amnesia, despite contemporary newspaper accounts with opposing political agendas publishing confused, selfserving oral testimonies. Limiting Cheikh El-Arab's story to his violent glorious demise in 1964 represents the official version, one that dovetails with those of the Moroccans I interviewed who held that abuses during Hassan ii's reign were necessary to combat violent groups like Cheikh El-Arab's. Their questions to me were what if a one-party, socialist junta had succeeded in taking back power in the 1970s? Would there be more justice, less oppression of the opposition, more room for effective civil society, given the example of neighboring Algeria, a hostile socialist state that supported many Moroccan

insurgents? Their conclusions were that Morocco remains blessed in having a stable monarchy because “anarchy is worse than killing” (al-fitnah asaddu min al-qatl). In marked contrast, the goals of Hallaoui and Mehri, according to their respective testimonies, were to retrieve the political climate and memory of what had been a powerful refusal on the part of thousands of Moroccans in the immediate post-independent years who opposed political and economic policies that served merely to Moroccanize colonial hegemony and exploitation. Hallaoui and Mehri spoke about violent asymmetrical repression, first by the French, then by the Moroccan state, against forms of leftist-cum-nationalist dissidence whenever recurrent worker or student uprisings erupted (Monjib 1992: 305-14).[85] A concerted focus on revised histories of the post-independence decade has, since 1999, seen the emergence of former political prisoners willing to speak out as one component of the rich array of actors involved in the actual events.

Cheikh El-Arab is one such protagonist who bridges the worlds of colonial and post-independent Morocco. Born in 1927 in Agouliz, in the Igherm region of south-west Morocco near Tata, he was from the Tashelhit-speaking Berber tribe of the Issafen. At the age of twelve, he left for the capital Rabat to join his father - legend has it that he walked the entire 675 kilometers. In Rabat, he was educated at the nationalist M’hammed Guessous School, which Ahmed Belafrej had founded in 1934 to counter the limited educational opportunities available to Moroccans (Aherdane 1991). He joined the Istiqlal nationalist party at its formation in 1944 to fight for independence and the restoration of the monarchy. Nobody doubts that he was an active member of Morocco’s aln. Arrested in 1954 by the French, he was sent to the French-built penitentiary of Kenitra Central Prison to serve a two-year sentence. After his release, he lived clandestinely through the year of independence. He was a man who made daring escapes. During the crucial battle of 1958, when combined French and Spanish forces obliterated all but remnants of the southern arm of the aln near Ifni, he emerged unscathed (Smith 1999: 195-97). Was he a combination of Zorro and Robin Hood for the Moroccan south and coastal urban shantytowns (Boukhari 2004; Diouri 1987; Louma 2003) or a bandit of wounded patriotism fighting for his country’s dispossessed? Was his group criminalized by the monarchy attempting either to assimilate former independence fighters into the Moroccan army or effectively marginalize them (Hobsbawm 1959)? According to Mohamed “Fqih” Basri’s disputed revelations, further versions describe Cheikh El-Arab as an apolitical weapon, a thug and a desperado whom the prominent Moroccan leaders Abderrahmane Youssefi and Mehdi Ben Barka conscripted to topple the monarchy after independence. This latter narrative depicts betrayals and palace plots to destroy the unfp opposition party with Cheikh al-Arab as the palace-instigated provocateur on the police payroll and advocating the monarch’s assassination (see Bennouna 2002: 58-62; Daoud and Monjib 2000: 287-93; Perreault 1990: 71-84; Poulsson 1964: 473-74 on the trials and events surrounding Cheikh El-Arab).

Historian John Waterbury’s measured judgment did not engage with convoluted palace machinations or the existence of a genuine armed opposition. Instead, he presciently deplored human rights abuses during their trials (a discourse that Hallaoui and Jawhar elaborated four decades later when they felt free to recount their systematic torture): “the police and court handling of the accused violated most norms of judicial procedure” (Waterbury 1970: 293; confirmed by Poullson 1964). The demise of Cheikh El-Arab led to

another massive round of arrests of union leaders, as well as members of the aln, and of the unfp opposition party, all of whom were accused of plotting against the king in the “23 July conspiracy.” About 1,700 known party militants and 5,000 more people were held incommunicado in detention until their mass trials from 22 November 1963 to 14 March 1964. The year 1963 was a watershed moment in the chronology of Moroccan state repression, already foreshadowed by the new Moroccan constitution of 1962, which placed governance under royal authority, permitted royal dissolution of Parliament, and enshrined legal principles enabling laws to be promulgated by the king alone (article 26), including the right to declare a state of emergency (article 35). Although prison abuse was and is prevalent in Moroccan jails and political prisons, 1963 saw the organization, institutionalization and widespread use of torture on a grand scale. When unfp leaders were arrested and accused of plotting against Hassan ii in 1963, they were taken to the villa of Dar El Mokri in Rabat to await transfer to a mass torture center that by 1964 had been set up in the basement of the Casablanca police commissariat of Derb Moulay Cherif. Muhammad Oufkir, who was responsible for eradicating Cheikh El-Arab’s group, had been recently named general, a step to becoming the feared minister of interior and brutal head of security who established a parallel network of secret services and torture centers. These events of 1963-1964 were turning points in the expansion of Morocco’s surveillance system, mass arrests and sweeps by the authorities, torture and more extensive sites of secret imprisonment, and forced disappearance scaled exponentially higher to accommodate larger numbers of those deemed to be dissidents (Buttin 1997).

What separates fact from fiction, and what, amid competing historical interpretations of past plots, trials, and imprisonment by a range of Moroccan political actors, is the truth? Indeed, the post-Hassan ii period has become an era for research, public debate, testimonies, publications by mass-circulation newspapers, truth commission reports, memoirs, novels, comic books, poems and photographs portraying contingent truths about the country’s history of repression and thereby expanding ways of narrating the story of opposition to the monarchy (El Guabli 2017; Hegasy 2017: 83-112; Miller 2016). The events surrounding the Cheikh El-Arab group, as interpreted over decades and through successive modes of communication, include public testimonies by surviving actors as well as the current generation of Moroccans’ quest for knowledge about the dark periods of the past that live on in the present. Morocco’s search for documentation and interpretation about the past, for the actual bodies of the disappeared and for the names of the torturers is an elaborate and frustrating process, filled with confusion and moral complexity.

Between Mohamed Louma’s scholarly historical reconstruction of the Cheikh El-Arab revolt and the history of its retelling in the context of current Moroccan politics, it is worth noting that the public testimonies of Brahim Hallaoui, Mohammed Mehri and Ahmed Jawhar about their shared past in the early days of independence served a new objective. These testimonies intersected with journalists’ post-1999 exposes of torturers, many of whom were still in powerful posts or held elected political office. Hallaoui delivered eloquent interviews between December 1999, the date of Jawhar’s death, and his heart attack in March 2000. These media appearances by Halloui and Jawhar served two purposes. On the one hand, they vocally denounced certain government functionaries in power, including Youssfi Kaddour, a senior civil servant and known torturer at Derb Moulay Cherif and Mahmoud

Archane, a former police officer, torturer at the Rabat Commissariat, and a member of Parliament until his defeat in the election of 27 September 2002.[86] While human rights denunciations of carceral crimes were crucial to the creation of various Moroccan government human rights bodies in the twenty-first century, articulate armed militant fighters of the 1960s were at the same time being reconfigured into depoliticized victims of torture and disappearances after 1999. In doing so, these new human rights attempts to undo political repression consciously modeled powerful international human rights discourses (Dwyer 1991; Karem 1991; Mayer 1999; Missoffe-Rollinde 2000; Waltz 1995). According to Driss Benzekri (1997: 7), the term “human rights” was not part of Morocco’s official rhetoric until 1990.

Torture and disappearance linked these two decades of the postindependence period, whether it was the first decade of the 1950s and early 1960s when political outcomes seemed fluid, or whether it was the new openings in 1999 after Hassan ii’s death. However, nationalist fervor exemplified the first period after independence in 1956, while a focus on torture and the disappeared bodies of family members characterized the discourses of witnesses from the cell and graveside. Even so, there is a caveat whenever descriptions of torture are necessary and ubiquitous at public events and commemorations.

Transforming armed resistance fighters into torture victims risks privileging memories of human rights abuses that were disconnected from historical knowledge of the Moroccan past. To testify and to witness are two kinds of speech activities with different messages and audiences implied. Testimony is narrating personal witness, but this puts it in a situation-specific register that differs from bearing witness as a personal experience narrative. How do judgments of facts enter the Moroccan discussion, whether in court or in writing? Are there ways in which the public performance of dissent articulates and straddles distinctions between public and private once the prison cell and the grave are introduced?

As I reread my fieldwork notebooks describing the innovative performative practices evoking Morocco’s prison past, which on occasions I witnessed in the Casablanca-Rabat-Kenitra coastal urban agglomeration when channels of communication shifted from speaking to prison walls and beside graves in cemeteries and that could only imagine the various publics, I discerned the creation of venues of performance in many different registers in the post-1999 era. Still to be analyzed are such questions as how are audiences created and assembled, who is now doing the judging, and what social repair work is being made possible? As long as the tortured human body is alive, it lends its capacities to eulogies, photography, and witnessing. The pathways of human rights performances about Moroccan history are sometimes surprising. Even corpses have begun to speak. In what follows, I discuss occasions when the emergence of dead bodies and mass graves, produced through state atrocities against its own Moroccan citizens, entered the public sphere (on the forcible disappearance of Omar El Ouassali, see Kilani 2008; Menin 2016).

*** 4. The Gravestone Project for Human Remains

The year 2005, with a minor extension into 2006, was the end date for the mandate of the ier (Instance equite et reconciliation), the Moroccan truth commission. A follow-up group overseen by the Consultative Human Rights Commission (ccdh) continued to research the fates of those forcibly disappeared, as well as the whereabouts of mass graves and unidentified bodies from the Years of Lead (cndh n.d.; Crossland 2013; Laqueur 2015). The protocols under ier commission president Driss Benzekri were to leave behind human remains wherever found, while creating programs to study and maintain unsorted, disarticulated and commingled body parts in mass graves into which deceased prisoners had been thrown, buried, and subsequently discovered.

Perhaps at the limits of this approach to the public sphere, gravestones were scattered as memorials throughout a site physically aligned as much as possible with a single body, yet marked with an individual epitaph that the ier envisioned could become a place of mourning. In following these ier-instituted practices, the management of spaces dedicated to the dead passed entirely into the hands of the state, supplanting rituals between religious authorities and local actors.

The legal principles attached to corpses and body parts differ from other material objects in terms of acquisition, ownership, disposition and deaccessioning. Human remains are not usually recognized by law as property or cultural property (Ferllini 2007; icrc n.d.). Historically, no property interest could prevent bereaved migrants from bringing the dead with them from town to town by repeatedly exhuming loved ones. Lawmakers wishing to avoid gruesome prospects of repeat exhumation granted to the next of kin only limited property rights for the purpose of burying or otherwise disposing of human remains (Marsh 2016). The questions facing the Moroccan truth commission were how to deal with rediscovered bodies and with the appearance of mass graves that proved the state’s atrocities. They came to consider this subcategory of human remains as a public good and related to the work of cultural heritage. In other words, rightful owners are no longer heirs by bloodline or last will in possession of legal ownership over the corpse unrestrictedly as a private asset to keep, move and rebury. Instead, corpses from human rights violations are patrimony, owned by the Moroccan people and only state institutions can adequately honor them as representatives of collective history and memory. Public interest outweighed the private to render human remains accessible and visible through a gravestone, a separate memorial in a cemetery, or a public institution such as a center or museum.

Although several ier members were involved in these state projects, among them Latifa Jbabdi and Salah El Ouadie, my interviews were with Abdelhak Moussaddak, a former political prisoner from the Marxist groups who became a long-time staff member of the ier. He was also put in charge of the dossiers of the disappeared, first by ccdh, then by the successor government body that became the cndh or National Council of Human Rights. In interviews in Rabat on 6 June 2011 and 27 April 2013, he told me how convening family meetings began the process of keeping the remains of loved ones on the site of the mass grave instead of exhumations and removal to family plots. His remit included one of the

most famous cases, the human remains from Tazmamart, Morocco’s most notorious secret prison in the remote southeastern hinterland (cndh 2015). These remains belonged to military personnel from the Rabat region who had been implicated in unsuccessful attempts at regime change in the 1970s. They had been kidnapped and taken far from Kenitra Prison, which is north of Rabat, where they were kept in the secret prison for eighteen years until their deaths. Keeping their remains in Tazmamart made it difficult to establish clear dna identifications for each cadaver, since decomposition and intentional destruction by the perpetrators had made intact skeletons a rarity. The French laboratory undertaking the dna examinations established only four definite identities from the remnants. Since such human remains straddle the divide between private property and cultural heritage, the gravestone project arose to restore cemeteries and mark spaces of burial for those who had died in secret prisons (cndh 2013). This is often a difficult undertaking because, in many cases, the gravestones of forcibly disappeared political prisoners have no real or symbolic meaning for the actual inhabitants of the village in which they died.

Having failed to obtain official permission to visit Tazmamart, I toured other former secret prison sites in the south (Nadrani 2009; Slyomovics 2015). In contrast to Tazmamart, a French-built colonial army camp that Hassan II had converted into a secret prison, the fortress of Kalaat M’Gouna lies along the southeastern tourist route to the Valley of Roses in the Dades region. According to local historians, Kalaat M’Gouna had also been a French military fort erected between 1942 and 1948 under the Protectorate’s corvee system of forced labor levied on the peasantry. It was a late addition to the string of French forts extending westwards from Tafilalet on the southeast border with Algeria to the Atlantic Ocean. It reinforced French pacification efforts by serving as a site of repression under the Pasha Thami El Glaoui, the French-designated Moroccan despot drawn from the regional ruling family. In the 1980s, under Hassan II, it was converted into a secret prison to house a mix of 400 forcibly disappeared people, who included Sahrawis from the southern coastal provinces, urbanbased students from the leftist movement of the late 1970s, and other random arrested groupings. For those who died in Kalaat M’Gouna secret prison, gravestones were erected, and enclosed behind walls below the citadel (Figure 6.6), while for Agdez they were placed across the road from the prison in the municipal cemetery (Figure 6.7) .[87]

The headstones placed within these delimited cemetery walls were made in Rabat and were identical to those in the other cndh cemeteries that had been set up, for example in Tazmamart. Each headstone was fabricated from thin white marble tiles with a rounded top edge. The face of the headstone was incised in flowing black script with a short inscription bearing the name of the hitherto missing political prisoner, the dates of their birth and death, and sometimes an epitaph.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-4.jpg][Figure 6.6 Kalaat M’Gouna walled cemetery for political prisoners, 22 April 2013 photograph by Susan Slyomovics]]

To account for the swift deterioration of these Rabat-style gravestones in the Moroccan south, anthropologist Lahcen Ait El Fakih advanced the notion of garlb, the stranger and its noun garabah, meaning strangeness, estrangement or the state of being an outsider in southern Morocco, one whose customs are foreign, therefore not ours to protect. His prime evidence is the culturally-estranging, marble headstones arriving from Rabat to commemorate the bodies of political prisoners deemed dangerous strangers who had been secretly brought from far away (interview, 23 April 2013, Errachidia). In other words, outsider representations were produced to make legible and reinforce the space of outsiders in communal local burial grounds. These Rabat-built structures meant nothing to the surrounding populations and bore no discernable relationship with local families or the region. Therefore, materially speaking, they are available for the taking, often to repurpose and add to existing homes and farms. In the rural areas of the southeast, a proper burial traditionally leads to natural decay and the eventual disappearance of an individual's remains, though the general place of burial spaces remains known and observed. Their own rural graves had neither headstones nor epitaphs, merely an unmarked flat stone at the foot of the corpse to designate a male or female body lying beneath the earth. Close family members retain the location of rural graves for a few generations, but eventually the cemetery becomes a vast undifferentiated field of stones over slight, elevated human-sized columns of hillocks. Memory and transmission modalities from a centralized state or an international funding agency did not align neatly with subaltern practices and claims when the binary persists between our local dead characterized by willed communal dissipation into the earth versus not ours, subject to neglect and vandalism. Locals recounted to me that this formation of not ours resulted from living with special military forces guarding the perimeters of the villages in which the secret prisons were located, pervasive official categorizations of prisoners as criminals, terrorists, anti-monarchy, and Sahrawi separatists, all terms to enforce secrecy, fear, and silence about their whereabouts.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-3.jpg][Figure 6.7 Agdez cemetery for political prisoners, Agdez Prison upper left, 25 April 2013 photograph by Susan Slyomovics]]

In the Moroccan south, cndh attempts to set up cemeteries were deemed contrary to local rural custom and the practices of outsiders. Instead, the adjacent saint's mausoleum gracing the rural cemetery would serve as the place of visitation rather than the actual gravesite. The historian, economist and sociologist, Mohammed Ennaji (2009, which I have translated from the original French), wrote about the cultural specificity of the gravestones in his ancestral village cemetery:

Personally, I still have deeply embedded in my memory the image of the cemetery in my village of several decades ago. A landscape conforms to a society and its beliefs. It has neither marble nor other form of ostentation in stone, no epitaphs either. From his holy shrine, a saint venerated in the region watches over the unmarked graves known only to the relatives of the deceased. Dust, nothing but dust and not figuratively. The expression of nothingness in which mankind finds itself in the afterlife. Thus, even before this, there is proof of the perfect equality of men after death. The fear of this, due to its offensive

presence, provides the incentive to close ranks around the sacred. The frequency of death that prematurely mows down a part of the family and threatens the rest because of the precariousness of subsistence makes the cemetery an essential site in the social life of the community. No extravagance, since there is no reason for it, was allowed. Individualism was synonymous with social death for anyone who already displayed it in his lifetime. Today, our cities have grown, the evolution of mortality rates and life expectancy allow us to turn our backs on death. The cemetery becomes a distant space in which reality is not often remembered. The glaring differences in everyday life are increasingly present in the management of the space of death as in the arrangement of graves. While physical and spatial diversity imposes social hierarchies and power relations, will this also emphasize different expressions in relation to death? Will modes of speaking about our experience call into question the “cultural and linguistic unity” characteristic of our passage from life to death?

The word sahld, both a martyr to a cause and a witness, along with sahadah, the act of witnessing, are related to the larger semantic range in which sahld also means gravestone or epitaph. Thus, between 2007 and 2011, through the gravestone project, the cndh Rabat mandate proceeded to memorialize those who had been forcibly made to disappear in the rural south. Their thin white marble headstones were actively standardized in all Moroccan cemeteries between 2009 and 2010, although earlier plans had preceded that one. According to Ahmed Herzenni, who took over from Driss Benzekri as president of the cndh, cemetery memorialization projects had been pioneered in Marrakesh, Fez and Nador: gravestones were obtained for the ninety-nine people killed during the 1990 Fez uprising who had been secretly interred in the city’s Bab El Guissa and Boubker Ben Larbi cemeteries, as well as for those in unmarked mass graves who had died or disappeared during the 1984 student uprisings in Nador (interview with Ahmed Herzenni, 18 April 2013, Casablanca; cndh 2016).

Another cndh cemetery intervention concerned those killed or injured during the 1971 and 1972 coups d’etat perpetrated by groups that ended up secretly imprisoned for eighteen years in Tazmamart. The families of the victims of the Tazmamart secret prisoners, whether soldiers who defended the monarchy against the failed military coup at the palace, or guests killed in the crossfire, received lower reparation sums than the generous ones allocated for life to their adversaries who had been imprisoned in Tazmamart for eighteen years (Slyomovics 2008: 95-114). They also formed a victim association calling for a monument with names and texts condemning the overthrow of the monarchy to be placed in the grounds of the palace in Skhirat where their loved ones had been shot or, failing that, in the town’s main square. The authorities rejected both sites, but a compromise was reached to erect a commemorative monument, albeit on a smaller scale than the architectural structure that the association had originally commissioned. Eventually, after more than two years of negotiations between the association representing the families of the Skhirat coup d’etat victims and the cndh, a monument was placed near the entrance to Rabat’s Chouhada cemetery. In that this monument is not physically linked to the bodies of any of the victims, it is considered a memorial within a cemetery as opposed to a mausoleum (Figure 6.8).

These sumptuous urban burial practices found in the Rabat cemetery or linked to human rights initiatives that deploy marble headstones at sites where mass graves are uncovered, for example the memorial to the dead and disappeared of the 1965 urban Casablanca uprisings, are at odds with rural customs in which graves, marked with a stone but no inscription, eventually disappear into the earth (see Slyomovics 2005 on the various Casablanca uprisings). It seems that a positive outcome of cemetery memorializations emerged from the work of researcher Jamal Bami, which exposed the state of Muslim cemeteries throughout Morocco. His 2012 report to the cndh scathingly described Morocco's many cemeteries as being in deplorable states of dilapidation, vandalized through lack of guards, used as garbage dumps or places of prostitution and assignation. He stated that a lack of funding and government oversight had led to such disrespect for tombstones, graves and cemeteries (Bami 2012). Even the tomb of Driss Benzekri, Morocco's remarkable leader of human rights associations and first president of the truth commission was reported to have been vandalized on 1 May 2013 (Figure 6.9).[88]

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-2.jpg][Figure 6.8 Monument to the victims of Skhirat in Chouhada Cemetery Rabat, 27 April 2013 photograph by Susan Slyomovics]]

The conclusion of the Jamal Bam-cndh report contained proposals that envisioned turning cemeteries into landscaped places of greenery in which civil society played a major role both to maintain and enjoy. Moreover, responsibility for the management and maintenance of cemeteries should devolve to local elected council officials in collaboration with the Ministry of the Interior, the Ministry of Habous, the old neighborhood of Casablanca, or sometimes the Ministry of Culture when historic mausolea are involved.

[[a-j-allen-james-fromherz-nadav-samin-knowledge-aut-1.jpg][Figure 6.9 Grave of Driss Benzekri, president of the ier and ccdh, Ait Ouahi, Morocco photo by Susan Slyomovics]]

*** 5. The Return of Cheikh El-Arab's Body

Burials and gravestones fit Foucauldian notions of biopower that address the state's power over the individual through the manipulation of biology and society (Foucault 1980. The Moroccan infrastructure of cemeteries and prisons, aided by a state security apparatus for containment and disposal, serves to punish and hide the body of the political prisoner. Sometimes, however, a corpse dramatically unsettles and even rewrites history. This was the case of the missing body of Cheikh El-Arab. On 5 November 2005, during the last months of Benzekri's presidency, the ier discovered that the tomb of Cheikh El-Arab was in Casablanca's Sbata cemetery. A team headed by Salah El Ouadie and Abdelhak Mossaddak investigated the possible locations for Cheikh El-Arab's burial place by triangulating among the available hospital paperwork, cemetery registers, interviews with those who had witnessed the events, and cemetery personnel such as gravediggers. Their investigation

uncovered that Cheikh El-Arab’s corpse had swiftly been transferred for burial to Casablanca’s Sbata cemetery on the day of his death, 7 August 1964, recorded under number L295 with an accompanying note that the deceased had a bullet in the chest. Morocco’s folk hero had been interred in the section reserved for guraba’, strangers and unknown dead, where, as it happened, the corpses of other famous political disappearances had also been dumped. After finding the gravesite, Benzekri sent M’barek Bouderka of the ier to tell the family of Cheikh El-Arab who resided in Paris. Three days later, on 8 November 2005, forty-one years after Cheikh-El Arab’s death, Bouderka personally met the family, his widow Amina, daughter Nadia, and sons Karim and Toufiq Fouzi. They were grateful for the knowledge of their loved one’s burial site, for which I thank Aomar Boum (personal communication), who had interviewed Brahim Nouhi (on 25 May 2004, 15 July 2010, and 24 July 2017 in Akka and Tata in southern Morocco respectively) and who had helped to resolve the location of his burial place. Thus, those formerly labeled unknown guraba’ were individually identified, named with a gravestone marker, and reinstated to the world of the living who mourned them.

The human body - contained in prison and the cemetery - lies at the heart of the Moroccan truth commission. Its fate was and is as the nexus of resistance, synecdochically legible in the arms of Islamist political prisoners photographed in Oukacha prison, in the still-bloodied corpse of an anti-monarchist nationalist, and among the rediscovered human remains of numerous dissidents. The body may temporarily disappear behind prison bars and into the grave, and the wait for its reappearance and acknowledgment has taken too long. Yet, the absent body unleashes myriad social and political forces about its own fate at scenes of violence. The creation of new publics emerging from these restricted spaces awaited more favorable political contexts of the postHassan ii era in which archives were made available with new and better documentation practices created (Slyomovics 2016). Moroccan projects to study state violence, notably by the successor entities of the ier, ccdh, and cndh, received enormous impetus from political prisoners released into Moroccan society, who then formed human rights associations and populated the state’s human rights bureaucracies. Their goals, whether on a practical or symbolic level, are to reinstate all the disappeared dissident bodies to address the Moroccan public sphere about its recent past.

** 7. Rethinking Knowledge and Power Hierarchy in the Muslim World

el-Sayed el-Aswad

Dale Eickelman’s scholarly themes and approaches have had an immense impact on the anthropology of Islam. The objective of this chapter is to provide critical insight into Dale Eickelman’s contribution to the anthropology of Islam in general and the anthropology of the Middle East in particular. I look at the underlying themes of Eickelman’s scholarly work on knowledge, power, hierarchy, forms of authority such as the sacred and the mundane, ways of knowing and learning (for example, through traditional religious madrasas or modern secular education), communication, and the transformation of the Muslim world. As his early published scholarship attests, Eickelman saw knowledge and power as central to understanding the core drivers that bring about, over time, changes in religious and political authorities, ideologies, and social hierarchies in Muslim societies.

In his anthropological work, Eickelman exceptionally applies key elements of the holistic interdisciplinary approaches and sources, including ethnography, social biography, travel, historical documentation and cross-cultural studies. He has dealt with different forms of knowledge - religious, traditional, secular and modern - as well as with various forms of communication and new media that have operated as drivers impacting Muslim countries such as Morocco, Oman, Egypt, Indonesia, Iran and Turkey, to mention but a few (Eick-elman 2004). There is an Arabic catchphrase describing the Arab world in geographical terms, from al-khalij (the Arabian Gulf) in the east to al-muhit (the Atlantic

Ocean) in the west. Inversely, Eickelman started his extensive work in Morocco, located at the western edge of the Middle East, and progressed eastwards to the Sultanate of Oman (the Arabian Gulf) and beyond.

As he himself acknowledged (Eickelman 2009a), Clifford Geertz's comparative historical approach clearly influenced Eickelman's (2005: 68) thinking on "the changing role of religious intellectuals and ideas of learning in Muslim societies." Eickelman's work was further inspired by Jurgen Habermas's (1991) ideas of the public sphere and forms of communication technologies in the context of structural transformations in education, politics, and the state. Eickelman also gained insights from Pierre Bourdieu's work on education and

symbolic capital as well as from Antonio Gramsci's notions of cultural hegemony and resistance (Eickelman 1992a, 2005). Such themes and influences resonate in much of Eickelman's work.

Throughout that body of his work, Eickelman has offered detailed examinations of the discourses that shape most contemporary Muslim societies. In his "Gender and Religion in the Public and Private Sphere" (Eickelman 2008), he critiqued structuralism for its bias towards viewing societies as static and stable structures and not as dynamic collectivities created and transformed by people through their daily social interactions. He has challenged the hegemony of one factor or indicator such as income as the sole representative measure of social transformation and human development.

Eickelman refuted Western writings on Islam that promoted theories to the effect that social and economic modernization is likely to result in the dominance of secularism over religion, and thus render the latter to a marginal status in the modern world (Eickelman 2009b, with Asad 1986; Davies 1988; el-Aswad 2012; and Said 1978). He also asserted that the awareness of religious pluralism and different interpretations of Islamic sacred texts predate European modernity (Eickelman 2010). In fact, Robert Bellah (1970: 150-51, quoted in Eickelman 2010: 142) had also pointed out that Islam in the seventh-century was "remarkably modern ... in the high degree of commitment, involvement and participation expected from the rank-and file members of the community.'' Furthermore, Eickelman has argued that religion has not lost its role, but rather has succeeded in attracting more religious commitment as education has generated political and religious awareness. In other words, religion is becoming increasingly important in the public sphere.

Eickelman's (1985) approach incorporated an awareness of a multiplicity of Muslim voices, which is imperative in comprehending not only the complicated topic of Muslim public space, but also the complexity of the anthropological inquiry in Muslim societies. For Eickelman, it would have been incomprehensible to portray religion with a single voice in Muslim countries where dissident voices from religious scholars ("ulama) and laymen are raised to challenge both religious and political authorities. What is significant here is that Eickelman

(1992b: 7) described religious activism in the political sphere as “a distinctively modern phenomenon” (see also Eickelman 2000).

The unique quality of Eickelman’s scholarship is that he pays attention to Middle Eastern and Muslim societies and related social and political movements from both the bottom (the general public, how it is influenced by mass education, and how mass media influence it) and the top (the socio-economic and political elite and the government). In other words, Eickelman’s work explores the interrelationships between the transitional outcomes (such as religious and political change) and the many factors influencing such outcomes, including educational, technological, socio-economic, and cultural drivers.

To his credit and for the efficacy of his work, Eickelman developed intimate and friendly relationships with informants and colleagues.[89] While studying the Sharqawi maraboutic descent group, Eickelman introduced himself to Hajj Abd ar-Rahman Mansuri, a judge (qadi) who served as an informant as well as an interpreter of the Sharqawi historical documents. Hajj Abd ar-Rahman was so personally interested and engaged in the Sharqawi papers that he and Eickelman (1985: 20) became “colleagues’’ working on a “common project.”

Knowledge practices represented in mass education, mass communication, new technology, travel, labor immigration and globalization have a great impact on the transformation of religious and political identities and authorities in the Muslim world. However, the drivers of social change in the Middle East vary according to what types of governmental and non-governmental agencies and actors operate in each country (el-Aswad 2019). The main question here is to what extent does Eickelman succeed in showing that such aforementioned factors as knowledge, education, technology, travel or migration bring about, over time, changes in the religious worldviews and power structures of Muslim societies? According to Eickelman, “mass higher education, mass communications, new media, and the greater ease of travel has facilitated the fragmentation of political and religious authority and the development of new voices that contest or ignore established authority” (Eickelman 2005: 71; Eickelman and Piscatori 1996: 121-35).

*** 1 Ethnography of Knowledge

Eickelman’s primary contribution to the social sciences has been to consider the centrality of knowledge, attained via education, media, information technology, travel, migration and globalization as the underlying force or power to transform socio-political structure and religious authority. At the same time, he has emphasized the idea that religion can change or transform without failing to be religion.

In his book Knowledge and Power in Morocco: The Education of a TwentiethCentury Notable, Eickelman (1985) looked at traditional intellectuals as counteractive to the predominant focus on Western-trained intellectuals. He focused on textual knowledge as well as on the way in which that knowledge is achieved and used by a religious intellectual. As his early published scholarship attests, Eickelman considers knowledge as central to understanding core drivers that bring about, over time, changes in religious and political authorities, ideologies, and social hierarchies in Muslim societies.

For Eickelman, knowledge, whether cultural or political, and symbolic production are vital factors in the socio-political construction of human society. “Politics can be conceived as cooperation in and contest over symbolic production and control of the institutions - formal and informal - that serve as symbolic arbiters of society” (Eickelman 2009b: 163). Politics, typically viewed as a struggle over population and resources, is a fight for people’s imaginations as well as a competition about the meaning of symbols. In the following sections, I elaborate on the major themes related to Eickelman’s overarching thesis of knowledge and power.

*** 2. The Power of Education and the Transformation of the Hierarchy of Power

Eickelman (1978: 485) was concerned with how the intellectual technology, or forms of transmission of knowledge shaped and accommodated social and cultural change in society. Education has been viewed as a major driver of both traditional and social reform movements in the Muslim world before and after the advent of new media. Put differently, education continues to be the most common driver of change and overall development in Muslim countries. In the scholarly literature, there has been great emphasis on education, particularly state-sponsored education as an essential driver for development in Middle Eastern and Muslim countries. Education enables people to exercise influence beyond the nation’s borders through participating in decisions taken on local and global measures (el-Aswad 2019).

Traditional and modern systems of education and religious beliefs generate distinct forms of authority. Old and new modes of understanding religion coexist in most Muslim societies. Many aspects of madrasa (mosque school) education remain significant in Muslim countries. For instance, despite the introduction of modern education and schooling provided by the state in Algeria and Morocco, Quranic schooling has been considered relevant to local needs and has served as a means of challenging state authority. In Morocco, the models of peer learning in madrasa education and in religious brotherhoods have been altered by religious activism (Eickelman 1992a).

Men of religious learning ("ulama) have regarded themselves as legitimate spokesmen for Islam (Eickelman 1978). In his study of the popular beliefs and practices of Muslims in an urban pilgrimage center of Morocco, Eickelman addressed various institutional

imperatives motivating and altering people’s social behavior. Concentrating on the Sharqawi descent group, a Moroccan maraboutic and sainthood center, Eickelman tackled the ways in which certain key concepts within the local interpretation of Islam served to provide a meaningful and coherent worldview guiding social action. For example, individuals followed the guidance of the Sharqawi, whom they believed to be able to serve as an intermediary between God and people, in order to achieve blessing (baraka) and awards in this world and in the next world (Eickelman 1976). Members of the Sharqawi descent group manipulated religious ideology and symbols to achieve certain goals and positions, gain power, and generate changes in the cultural ideology, which, in turn, restructured the social order to be hierarchical in contrast to the modernist-scripturalist Islam that emphasizes the equality of all people before God.

Eickelman discussed the conflict between scripturalist Islam and marabou-tic or mystic beliefs and practices. Adherents to scripturalist Islam have expressed reservations about the beliefs and practices of the followers of saints, viewing them as not representing the real or true Islam. The power of knowledge or education harnessed by Islamic reform movements has, within the historical context of the Muslim world, put pressure on the cult of saints, which are in relative decline, although there are people who still practice Sufism and sainthood in Muslim countries such as Egypt, Morocco and Sudan. Although there is a strong belief that priesthood or mediation should not be recognized or accepted by Islam, people in Shi'a communities in Iran, Iraq and Bahrain, among other countries, can choose a guide (marja" or source of emulation) who is viewed as a religious authority at both the personal and collective levels (el-Aswad 2012:15, 60-62).[90]

Traditional Islamic education in North Africa, particularly before 1930, was mnemonically acquired. Further, religious dogma or authority in earlier generations derived from the mastery of authoritative texts studied under established scholars (Eickelman 1978). However, with the impact of French colonialism, particularly after the establishment of the Protectorate in 1912 and the advent of modern schooling, there was a change from religious authority and knowledge that depended heavily on memorizing sacred texts of material that could be obtained and checked in books and other sources (Eickelman 1974). With the progress of education, religious knowledge could be attained and interpreted not only by men of religious learning (^culama), but also by any literate person showing serious commitment to religious beliefs and practices (Eickelman 1978).

Eickelman’s research linked Islamist movements to the spread of higher education and increasing literacy rates in Muslim countries. Mass higher education promotes direct and selective access to the printed word detached from earlier traditions of authority. However, the timing of educational expansion has varied from country to country, especially in the postcolonial era. Mass higher education began in Egypt in the 1950s, and the number of primary school students more than doubled there in the decade following the 1952 revolution. Corresponding increases in secondary and university education began in the mid-1960s. While educational expansion in North Africa, including Morocco, began in the 1960s, it began to expand in the Arabian Gulf countries, including Oman, in the 1970s (Eickelman 1992a).

The impact of mass higher education on the transformation of traditional religious authority in Oman started in the 1970s, particularly after the establishment of the Sultan Qaboos University in 1986. To assert its legitimacy, the State of Oman provided education to its managers and administrators, to teach them religious knowledge; yet the literate people disputed and opposed both state and religious authorities. As is the case with other Muslim countries, religious authority has shifted from elite specialists dominating religious texts to religious and political activists advocating more open religious discourses. This transformation has restructured politics and national cultures contesting state hegemony (Eickelman 1992a: 646-7).

In the secularized, democratic Muslim state of Turkey, religious beliefs and practices constitute significant aspects of the public sphere and are compatible with the secular nature of state institutions (Eickelman 2010). In Iran, where clerics continue to Islamize from the top-down, young Iranian people and mullahs, exposed to both traditional and modern schools, are able to represent traditional and updated interpretations of religious texts, creating and participating in Iranian religious public spheres (Eickelman 1992a, 2009b). Likewise, in Indonesia, mass higher education has empowered new voices that contest established religious and political authorities (Eickelman 2005).

In modern Muslim countries, plans are in place to elevate education to reach the level of global standards by increasing proficiency in technology, introducing advanced education techniques, updating curricula, developing innovative skills, and strengthening the self-learning abilities of students. Currently, state universities experience increasing competition from private universities and are forced to update their own institutional presentation and services (Eick-elman 2017; el-Aswad 2019). Women have benefited from the spread and improvement of education and have become involved in political and public life (Eickelman 2008). In fact, they now outnumber men in such Arab universities as those of the Arabian Gulf where gender segregation is prevalent. Eickelman has suggested that due to gender segregation (in which female and male students are not mixed in classes) education has seemed to be more important to Arab women than to Arab men in these countries as women have freedom and motivation to succeed (Eickelman 2017). Improving educational outcomes requires understanding the impact of educational policies, the influence of other social and political policy measures on pupils' learning, and also the role of non-policy drivers such as socio-economic environment and cultural background (el-Aswad 2019).

With the mass spread of higher education in the Muslim world, access to the Qur'an or sacred texts, as well as to other books and ways of knowing, shifted in form and number and Islamic publications multiplied. For example, 250,000 copies of an Islamic book written by the late Egyptian Shaykh Sha'rawi were sold in Egypt when previously the sale of 10,000 would have been considered a success (Eickelman 2004: 44).

One of the most important consequences of mass higher education and new media technologies is the objectification of religion that has taken place since the late 1980s. According to this concept, Islam has come to be viewed by Muslims as a self-contained religion in relation to other religions, and religious beliefs are seen as systems to be distinguished from one another. This means that treating Islam as a system of beliefs and practices implicitly highlights the differences between Muslims, who have become aware of the diversity of religious interpretations (Eickelman 1992a: 650). Believers who come to view religion as an object among other objects, selecting one aspect of that object, as with the movement towards the Islamization of society and/ or political Islam, over another, are distinct from traditional persons who take for granted religious beliefs and practices in much the same way as their forefathers. Such a process of objectification has broadened religious authority to include new religious intellectuals and laymen who, through attaining knowledge, information and ideas about Islam, dispute and challenge established traditional religious authorities. The new intellectuals and laypeople, including non-religious experts, have great impact on their cultures, even in subnational regions and countries that have high adult illiteracy rates, such as rural Egypt and Morocco.

One of the critical consequences of objectification is that the hierarchical system of religious authority, based on claims that Muslim scholars or state appointed religious authorities hold mastery over a fixed body of religious texts, has become sidelined and downplayed, ending the traditional religious experts' monopoly over the interpretation and management of sacred texts. In other words, religious leaders no longer have "a monopoly on sacred authority where Sufi shaykhs, engineers, professors of education, medical doctors, army and militia leaders, and others compete to speak for Islam" (Eickelman and Piscatori 1996: 211).

The grave problem is that while the governments of the Middle East have deprived religious scholars ('tiliimu) of their sources of financial support and their control of mosques and educational institutions, most traditional religious scholars have remained loyal to their governments. Meanwhile, educated people, independently of the state authority, have been centrally engaging in both religious and political activities. For example, laymen such as Hassan al-Banna, a teacher who founded the Muslim Brotherhood in Egypt, and Sayyid Qutb, a fundamentalist thinker who was not trained as a religious scholar, declared Islam as a solution to the problems facing Muslim countries. Sayyid Qutb depicted Islam as a system (minhaj) of beliefs and doctrines. If one sees religion as a self-contained system, it becomes possible to make changes by assimilating elements from other systems, and thus increasing the feasibility of the system. When fundamentalists reveal that they are involved in the Islamization of their society, they are asserting that their religious beliefs are part of an objective system (Eickelman 1992a: 646-47).

*** 3. The Power of Technology and New Media

Communications technology refers to contribution of technological innovation, particularly information technology, to socio-economic progress in a society. Access to a mediated public sphere and communications technology, new and print media, has given rise to a quintessential shift in informationseeking behavior and is rapidly transforming the production, distribution, and consumption of knowledge and information in many parts of the world (Eick-elman 2002; el-Aswad 2014). Use of the Internet and social media has facilitated democratic revolutions and played a crucial role during the Arab Spring. To be more specific, the impact of the Internet, mobile phones, Facebook, Twitter, YouTube and other communications technologies was so strongly and wisely used in Egypt during the 2011 anti-government revolution, or Arab Spring, that Egyptian authorities, in their effort to silence the protesters, “shut down the Internet, turned off the servers, and disconnected all available electronic facilities” (el-Aswad 2016b: 72).

To maximize the benefits of advanced technology requires a certain level of knowledge or education. However, early technology, particularly audio cassettes and videotapes, empowered illiterate people to have access to religious knowledge and mundane information. Sermons on audiocassette gave the illiterate opportunity to listen to exegeses and interpretations that were otherwise inaccessible to them (Eickelman and Piscatori 1996). Eickelman examined the way new media extended Islamic knowledge and identity at the cost of existing hierarchies and established forms of authority (Eickelman 2008; Eickel-man and Anderson 1999). The entry of Muslim societies into an era of mass communication has encouraged debate among Muslims.

Bin Laden, a civil engineer who established the terrorist group Al-Qaeda, is an example of an educated layperson who criticized many Arab and Muslim governments for oppression, corruption and subordination to perceived Western and Israeli aggression. Bin Laden, who relied heavily on videos as the main vehicle of communication, used both conventional and new media to spread his messages and lectures. The early videos he used showed an awareness of the popular culture in the regions in which his Al-Qaeda group operated. It was because of his use of technology for violent causes that Eickelman (2002: 43) called Bin Laden a modern fanatic. Politically oriented extremist and terrorist groups like the Taliban, Al-Qaeda, Da'ish or Islamic State (is formerly isis), and Boko Haram, which roughly translated means Western education is forbidden use Islam as a tool with which to justify their non-Islamic actions (el-Aswad 2016a; Sirgy et al. 2019).

In “The Arab ‘Street’ and the Middle East’s Democracy Deficit,” Eickelman (2002) foresaw the occurrence of an Arab revolt. He wrote, “the lack of formal outlets for opinion on public concerns makes it easier for zealots, claiming the authority of religion, to hijack the Arab street” (Eickelman 2002: 45). Such a statement encompasses the scenario of the Arab Spring in Egypt, in which followers of the Muslim Brotherhood forcefully emerged among Egyptian demonstrators who demanded that Mubarak and his regime step down. Indeed, by the following year (2012), Egypt was ruled by members of the Muslim Brotherhood. Yet, if we go back to the tragic event of the assassination of Anwar al-Sadat in 1981 by the extremists of the Islamic Jihad, some of whom were highly educated, it becomes obvious that dissidence can lead to terrorism. It also becomes clear that through such rebellious

confrontations the state is rendered susceptible to losing its power to protect itself, as occurred to the Egyptian state in June-July 2013 (el-Aswad 2016a, 2016b; el-Aswad et al. 2020).

New media and advanced technology have transformed traditional religious authority and brought changes to political systems. More broadly, they also offer alternative social realities to people in the Middle East, particularly women and youth, with mobile telephones playing an important part in creating opportunities to establish social relations between young people of both genders (Eickelman 2008). Furthermore, in Saudi Arabia, a large number of people prefer satellite television to the state television channels because the former provides alternative voices with which to address people's daily concerns about such things as poverty, divorce, drugs, pollution, and the politics of the royal family (Lee 2010).

In Muslim societies such as Iran and Egypt, the informal economic roles of women have a greater impact than formal legislation on changing accepted gender roles in the public sphere. It is also difficult for the regime to suppress or control people's informal political activity empowered by social media because it occurs outside the formally recognized public sphere (Eickelman 2008). Furthermore, people use the informal economic and political activities in which they engage in their daily lives as mechanisms for coping with economic hardship and political aggression. For instance, family obligations and loyalty to one's parents and kin play an important role in sustaining an informal economy that, in turn, supports the needy (Eickelman and Piscatori 1996; el-Aswad 2015, 2017).

New technology has facilitated and encouraged women's involvement in public space in Egypt, Morocco and other Muslim countries. The conventional view of inequality and the subordination of some countryside women to men has been contested and defied. Cross-culturally, and without belittling its negative and harmful consequences, the problem of female subordination or inequality is universal, not confined to a specific country or region (Ortner 1974). Some "fundamentalist Christians and ultra-orthodox Jews exclude women from many aspects of public life, and in countries such as the United States, Russia, and Japan marked inequalities persist in some regions" (Eickel-man 200: 143).

*** 4. Travel, Migration and Globalization

Modern technology and advancements in transport have expedited globalization and turned the world into a global village (McLuhan and Power 1989). Moving from the micro-ethnography and thick description of several Muslim communities in the Middle East to macro perspectives, Eickelman considered the impact of Muslim travel, labor migration and transnational activities on the emergence of a worldwide Islamic consciousness. Travel, trade and labor migration have created historic opportunities for Muslims, most of whom live outside the Middle East, to experience global mobility as well as socio-cultural exchange. Labor migration has played an important part in eroding frontiers between people. "Labor

migration has become for the spread of ideas in the twentieth century what pilgrimage was in earlier eras" (Eickelman 1992b: 7). Travel and labor migration necessitate cyber networks that, as a cultural medium, go beyond instantaneous tangible practices to include continuous reciprocity of material and non-material symbolic codes between people, whether Muslim or non-Muslim.

Travelers move to places beyond their homeland, interact with other people and adopt new lands as diaspora, or return home with rich experiences and new ideas. It is worth noting that most Muslims live outside the Middle East. Broadly and globally, for some Muslim "activities, a mosque in London or on Chicago's South Side may be as central as Mecca or Cairo for meeting counterparts from elsewhere in the Muslim world" (Eickelman 1992b: 6). The new media of the global era have contributed to the strengthening of ties to diasporas and also to other communities, including non-Muslim ones (Eickelman and Anderson 1999).

Over the last four decades, the global Islamic awakening has weakened traditional forms of religious authority, created new public figures, and encouraged public debates online and offline (Eickelman and Anderson 1999). What renders Muslim politics different from other politics is the fight for the ideas, values and symbols of Islam. Communal Muslim culture is centered on a vision that Muslim societies are united, whether actually, ideally or virtually, in one universal community (umma) guided by the Holy Book of the Qur'an and the Prophet's tradition (el-Aswad 2016a). By circulating their debates through the transnational media, members of the faith have opportunities to interact with each other socially and globally and to exchange ideas that, in turn, transform conventional understandings of religion. Sacred scriptures and interpretations of religious doctrines are accessible on the Internet, allowing people to read, interpret, and discuss religious texts. This, in turn, leads to a gradual decline in the hierarchical authority of traditional clerics at both the international and national level.

The virtual world of the Internet, encompassing virtual information on Islam and virtual dialogue, is not separate from the real world (el-Aswad 2012). Online forums concerned with Muslim culture and Islamic values provide both information and more interactive spaces in which various topics of Islamic heritage can be lived and negotiated. Many Muslim global movements show the positive side of globalization, in which Islamic transnational groups, through a calling for democracy, equality, freedom and more open societies, seek to improve the socio-political conditions of Muslim communities. Muslim intellectuals and activists are involved in transnational missionary activity (dawa) (Eickelman 2002). Many such intellectuals strive to construct positive images of Muslims at both the national and the global level through public lectures, sermons, conferences, workshops, and media programs. Much of the substance of Muslim worldviews is discussed, reproduced in new forms, and represented in various online Muslim virtual communities (el-Aswad 2013). Such global activities have undermined and weakened the ideology and agenda of the extremists and terrorists.

*** Conclusion

Although there are many studies on Islamic political thought and movements in Muslim countries, Eickelman's insights, which draw on ethnographic, historical and cross-cultural perspectives, offer a particularly comprehensive view into this critical area of inquiry. His major contribution towards bettering our understanding of human societies has been to highlight the power of knowledge ethnographically, historically and cross-culturally.

Following the model developed by Geertz, Eickelman proposed that sociocultural change comes about as the result of conflict between behavior and the beliefs or symbolic systems that are supposed to structure and guide social action. In Muslim countries, Muslim activists have emerged to demand revision of the place of religion in politics. Through better education, new technology, and ease of travel, Muslim societies have become more open and religion has become a matter of choice, not just heritage and habit.

Eickelman addressed the relationship between knowledge and power in the sense that knowledge leads to power and power may facilitate knowledge. Literate laymen and educated, secular Islamist intellectuals have played a crucial role in introducing social and political changes to most Muslim countries, and thus challenging the traditional religious authorities' support for authoritarian regimes and stalled or failed states. While it is true that the fragmentation of religious authority has enabled those who have generally been excluded from politics to act and have their voices heard, the Middle East still needs more people to participate in political life.

** 8. Salafism as a Contested Concept

Simeon Evstatiev

In this chapter, I regard Salafism as a contested concept that stirs up heated debates in Muslim circles as well as among Western Islamicists and social scien-tists.[91] The narrative of Salafism in the West has been almost fully dominated by media discourses, policy analysts or experts in “security studies.” This tendency prevails until today and might have even created the misleading impression of an over-studied subject. Being concerned mainly with the political aspects of modern Islam, the prevailing, approaches to Salafism almost entirely miss the intellectual, theological, legal, and cultural aspects of this phenomenon, whence its role into the large of Islamic history.

Is Salafism an “essentially contested concept,” and are arguments about its right usage completely irreconcilable? Addressing this single major question, I discuss the recent conceptualizations of Salafism relevant to my approach by adducing evidence from Muslim sources in Arabic. That question, however, entails a set of sub-questions, some of which have broader implications for the study of Islam. What does Salafism tell us about “Muslim politics” and how does it combine with apoliticism? Should we analyze modern transnational Salafism as a novel phenomenon shaped when Muslim societies were challenged by their encounter with Western modernity, or do we need to search for its historical origins in the pre-modern age, even in the formative period of Islamic thought and practice? What are the implications of the definition we choose for the categorization of Salafism? How does its study help us to understand authority and change in religious traditions?

I suggest that - despite it being a contested concept - Salafism is a Sunni religious orientation based on a specific mode of scriptural engagement coherent enough to be analytically discernible in a set of interrelated views on matters of theology and law shared by modern Salafis and their pre-modern precursors whom I designate as proto-Salafis. Given that high degree of doctrinal coherence, how shall we then grasp the observed diversity within Salafism today? Should we see modern Salafism as a continuum encompassing quietist Salafis, politically engaged Salafis and Jihadi-Salafis? Although with some variations

In what follows, I start with framing the notion of essentially contested concepts as relevant to major discussions in Islamic studies and the conceptualization of Salafism. I then tackle Salafism as a contested concept through the disagreements on its origin. Finally, I deal with the definition of Salafism and its branches, proposing some nuances to its understanding as a mode of scriptural engagement encompassing theology, law, and politics in a way distinct from other religious orientations in Islam. My aim is to demonstrate that Salafism is not simply a “highly contested” or “hotly debatable” but an essentially contested concept - a task that unavoidably entails generalization. However, as Clifford Geertz once commented, the question is not whether we generalize - any science generalizes - but how we generalize (Geertz 1972: 463).

*** 1. Essentially Contested Concepts and the Study of Islam

A student of Geertz with his own standing and eminence in anthropology and Middle East studies, Dale Eickelman to whom the present volume is dedicated notes that in Islam, continuous debates around notions, such as the “common good” (al-maslaha al-[!]amma), the proper performance of religious duties (Eickelman 2015: 136; Eickelman and Evstatiev 2020) or “tribe” (qabila) make these terms essentially contested concepts, for which “there are irreconcilable arguments about the right usage” (Eickelman 2016).[92] Among Muslims, such concepts constantly stir up heated discussions and conflicts over the nature and the practical implications of how to be a true believer and how to interact with scriptures, religious authority, and the locally embedded notions of culture and tradition. Essentially contested concepts are pertinent to Muslim religious life and historical experience no less than to all other religions and comprehensive ideologies that serve as matrices for building the collective conscience,[93] and Salafism - as a complex concept - is no exception.

When introducing the term “essentially contested concepts” in 1956, the Oxford philosopher Walter Gallie (d. 1998) examined a number of organized and semi-organized human activities that, academically, belong to aesthetics, political philosophy, history and the study of religion. He mentioned that there are groups of people who disagree about the proper use of the concepts, for example, of art, democracy, social justice, or Christian tradition. Gallie adduced the following example from art. The statement that “this picture is painted in oils,” he explains, may be contested on the grounds that it is, in fact, painted in tempera. In this case, there is “the natural assumption” that the disputants will agree as to the proper use of

the term. However, this is not the case with the statement, “this picture is a work of art” - it is liable to be contested because of an evident disagreement and the consequent need for elucidation of the proper meaning of the term “work of art.” Essentially contested concepts are, therefore, such “concepts the proper use of which inevitably involves endless disputes about their proper uses on the part of their user” (Gallie 1956, 1964).

Gallie himself and some later commentators stress, however, that the notion of essentially contested concepts should not be confused with promoting any conceptual relativism that is analytically destructive and undesirable (Collier et al. 2006). Essentially contested concepts entail a widely shared agreement on a concept but not on its most proper use and realization. As the British political and legal philosopher H. L. A. Hart (2012: 160) (d. 1992) explains regarding the complex idea of justice, it consists of two parts, “a uniform or constant feature ... and a shifting or varying criterion used in determining when, for any given purpose, cases are alike or different.”

As ideals that overarch groups, societies and cultures, essentially contested concepts may remain unchallenged. Ideas as democracy, for example, enjoy such a standing today in many parts of the globe but contestations appear immediately as to how a group of people or society should use the concept properly. To explain this phenomenon among Muslims in the Middle East, Dale Eickelman elaborates on the notion of “objectification” of the religious imagination. In the consciousness of a large number of people, Muslim believers increasingly bring to the fore three kinds of questions: what is my religion? Why is it important to my life? And, how do my beliefs guide my conduct? Objectification, Eickelman (1992: 643) explains, does not mean seeing religion as a monolithic entity, although for many believers it is precisely this. Even those claiming a return to authentic established traditions can thus share a modern attitude to social life. Eickelman thus demonstrates how Islamic concepts and ideals gain relevance in people’s everyday life through questions about their nature and the meaning.

The “objectification of Muslim consciousness” involves commitment, including in the case of modern Muslim political activists - the Islamists - “who are committed to implementing their vision of Islam as a corrective to current ‘un-Islamic’ practices” (Eickelman and Piscatori 1966: 44).[94] For Muslim revivalists, to be committed (multazim) is not simply to obey God’s commands, but to develop a personality completely devoted to God’s law “in every respect and every moment” (Schielke 2015: 63). Today, Islamic identity clearly does make a difference in various places around the globe, leaving the impression of having a much higher political relevance than the adherence to Christianity or Buddhism (Cook 2014: 37). With the observed spread of Salafi commitment in the Arab world and elsewhere, Salafism becomes one of the essentially contested concepts the use of which is challenged by some so far as to suggest that their research requires defining it, “if at all possible” (Anjum 2016: 449).

However increasingly “objectified” individually and locally, Salafism remains deeply embedded in the universalistic scholarly tradition of Islamic textual normativity. Based on shared beliefs and ideological positions that claim to represent the constant truth of authentic Islam, Salafism has profound social implications built on two sets of factors. They are grouped together, first, around the established normative doctrine and, second, around the approaches to their contextualization in social practice. Contextualization fosters interpretation, or what Gadamer (2004: 321-36) would call “being in the world” - the cornerstone of a hermeneutics that is especially relevant for the study of law and the understanding of authoritative texts from the past with the aim of resolving present-day disputes.[95] Restraint on political participation, passionate (sometimes even violent) political engagement and - perhaps in between them - a more discrete but potentially powerful social commitment can entail therefore thoroughly different identity-based actions and strategies for navigating the communal boundaries.

In Islam, as in other monotheistic religions, these boundaries are drawn, maintained and negotiated on the basis of a set of norms that are textually fixed in scriptures, laws and canons, and preserved and passed down from generation to generation. From the perspective of believers, scriptures are supposed to remain intact, but they are subject to constant theological and legal interpretation whose relevance to politics and social action varies in different religions. Religious engagement underlies a deep sense of belonging to a community and a shared comprehensive doctrine.[96] Indeed, as other comprehensive doctrines, Islam has never been monolithic, which makes its objectification and contextualization possible. Even though, if we judge from certain fragments of reality, Islam is to be seen as sociologically “localized”][97] but among stricter and more mainstream Muslims today seems transformed and increasingly superseded by the “great” Islamic tradition (Evstatiev 2019: 98) - a process in which Salafism plays a specific and significant role.

The notion of essentially contested concepts, however, is here not an invitation to delve into the endless debates on “essentialism”[98] or “Orientalism” - designations that have become overloaded with negative connotations (Evstati-ev 2008). Within these debates, some academics try to repudiate the notion of academic distance from the subject matter by replacing it with an activist stance. Recently, one scholar of culture (Brennan 2010: 278, esp. n.5), discussing the “militant language of engagement and activism,” noted that many of the journals in his field have already become platforms for work in what might be called the “combat mode.” Scholars of the Middle East and Islam are well aware of how “essentialism” has been turned into a standardized accusation often raised by authors who claim they adopt an “activist approach.”][99] The pressure to pursue activist and often biased analysis dependent on a dominant ideology of the day is not a novel phenomenon and should not be confused with the predisposition to take up “heated” arguments.

A classical advocate of scientific neutrality as ensuing from modernity is Max Weber, who - by announcing the “disenchantment of the world” - added in his vocation lectures (1917 and 1919) that it is impossible to arbitrate “a conflict of ultimate worldviews” as they are mutually excluding in terms of basic assumptions and values, so one has to

“choose between them” (Weber 2004a: 79, emphasis in original). However, the aspiration to scientific neutrality does not mean for Weber that one should not be committed, for science requires a passionate “intoxication” (Weber 2004b: 8). Although to some more recent scholars he did not prove the neutrality of science in spite of his “heroic existentialism” (Anderson 2004: 6), Weber made a clear distinction. Despite the need to aspire for scholarly neutrality, every independent teacher should repudiate the claim that “all questions which run the risk of stirring up ‘heated’ arguments should be excluded” (Weber 1978). Moral indifference is not to be confused with scientific objectivity (Weber 1949: 60). Scholars should tackle such issues not as propagandists, but as analysts, especially in a field “under siege,” such as Middle East studies today (Eickelman 2012: 213). Scientific “neutrality” should also not mean indifference also in the discussions of essentially contested concepts.

The study of Salafism as a contested concept is relevant to the ongoing discussions of unity and diversity, convergence and divergence in Islam. As Gudrun Kramer remarks, social sciences and the humanities after the “pragmatic turn” deal predominantly with action, motion and interaction because of which agency becomes the key word while boundaries are never stable but always shifting and renegotiated: “things are in flux, people are mobile, ideas are constructed and developments contingent, nothing is uniform no choir sings in unison: the universe is a perpetuum mobile” (Kramer 2006: 181). In line with such a trend, are the attempts to “decompose” Islam into many “islams” signaled almost three decades ago by scholars, such as the Egyptian social scientist Abdul Hamid el-Zein (1977: 242-43), who was as devoted to interpretive anthropology as he was to Islam (Eickelman 1981). More recently, this trend did not fade away, though taking different forms.[100]

In an otherwise highly erudite book, Shahab Ahmed found the question “What is Islam?” highly engaging, but he was more cautious than others. Along with the classical long-established scholarly views of Islam “as law,” Ahmed (2016: 148) rejected what he called the “islams-not-Islam” approach. The problem with such approaches that seek fully “to deconstruct” religion, and in this case Islam, is their failure to formulate any tenable definition. Ahmed himself eventually suggests conceptualizing Islam as “meaningmaking for the self in terms of hermeneutical engagement” (Ahmed 2016: 405, emphasis in original). However, if Islam is any “hermeneutical engagement,” as Frank Griffel (2017: 13) rightly comments, “there is nothing left in societies dominated by Muslims that is not Islamic.” In his struggle against “essentialism,” Ahmed’s arguments remain unconvincing and he offers a total generalization, which does not differentiate idea and fact, religion and culture, norm and practice. Not surprisingly, he compares “the Orientalists” with “the Salafis” accusing them of adopting the perspective of “Salafi historiography” (Ahmed 2016: 219).

Interpretation in Islam, as in any other religion or ideology, is highly important but it is not an endless and arbitrary “hermeneutical engagement.” As in politics, what is possible to do in religion “is generally limited by what it is possible to legitimize. What you can hope to legitimize, however, depends on what courses of action you can plausibly range under

existing normative principles” (Skinner 1998: 105). Religious traditions may change but this is a gradual and time-consuming process against a “considerable inertia” (Cook 2014: xv) requiring continuity in order to remain legitimate. In the meantime, interpretations are not unlimited and fully contingent on subjective choices. A cautious approach to Islam would therefore entail what Dale Eickelman (1982: 11) defines as a “middle ground” - a balance between the consideration of the “universal” and the “local” in religious traditions. Yet, despite the agency of individuals and the ubiquitous local diversity in interpretation, essentially contested concepts must keep a certain degree of coherence and continuity in order to be analytically tenable.

An appeal to the past - either by searching history for precedents for new claims, or seeing history as a development towards an advocated or denounced contemporary standpoint - is crucial in commonly sustained ideological argument (Skinner 1965: 151). As part of a larger structure, essentially contested concepts range within a spectrum of legitimacy that sustains the longue duree of each “universal” religion beyond localities and across time. In Islamic history, together with the evolved forms of religious textualism and scriptural scrutiny, these evoked historical antecedents interact with the socio-cultural contexts to facilitate discussions and heated - sometimes even armed - conflicts around the shifting and continually contested boundaries of inclusion and exclusion (Eickelman and Salvatore 2006: 5). Muslim jurisprudents upon the divine authorship of Islamic law (shari'a) and reject any idea of human reason as taking part in the creation of law.

Consequently, Muslim religious and legal thought is dominated by textual-ism - “an approach to the formulation of the law that seeks to ground all law in a closed canon of foundational texts and refuses to accord validity to law that is formulated independently of these texts” (Weiss 2006: 38). Salafis do emphasize this insistence, but do it by embracing a specific mode of scriptural engagement that distinguishes their shared views on matters of theology and law from other trends in Islamic thought and practice. While many would agree on such a formulation, there are still irreconcilable views on the historical origin of Salafism.

*** 2 The Contested Origin of Salafism

A major reason for the existing disagreements on when we shall trace back the origin of Salafism is perhaps the fact that all Sunnis revere the “pious ancestors” and refer to them, though with aims different from those of the Salafis, who insist on emulating the salaf as much as possible and in all aspects of religious life by adopting a theological and legal view that makes such an ideal feasible. Insofar the Salafis bring to the fore the idealized experience and practices of the Prophet and the early umma, the designation Salafi is highly prestigious among Muslims - even among those who disagree with the Salafis on some secondary religious issues. Another reason for contesting the exact scope of Salafism is the fact that when used to trends in twentieth-century Islam, the term covered such a wide range of orientations and views that, if applied to all of them equally,

becomes too vague - it is as if it denotes the entire Sunni spectrum of Islam and not just a specific trend thereof.

As Ovamir Anjum (2016: 449) ironically notes, in the twentieth century the term has designated religious scholars as different as the pro-British Egyptian modernist Muhammad ‘Abduh (d. 1905), on the one hand, and “the likes of the Wahhabi puritanical cleric, Shaykh ‘Abd al-‘Aziz b. Baz (d. 1999), on the other.” Consider that groups, such as Al-Qaeda and the Islamic State (isis) are also put in the same category, and the term Salafism is nothing but an almost useless vague designation. As clarified, even the most challenged essentially contested concept must have a constant core element and a set of meanhings on which those who discuss it have an agreement. Uniting Muhammad ‘Abduh (d. 1905), who referred to the glorious past of the ancestors in his attempt to reconcile Islam with modernity, and al-Bagh-dadi, the isis leader, under the same category, does not seem very encouraging as an analytical enterprise unless we broadly speak of different and even contradicting types of Muslim activism. Add the confusion caused by some Ottomanists and modern Saudi researchers who considered Birgivi Mehmed Efendi (d. 1573) and the subsequent seventeenth-century Istanbul movement of the Qadizadelis as “Salafi”, while they were strict Hanafis with Maturidi theology (Evstatiev 2015: 227-32), and the lines between the concepts are completely blurred.

It is, therefore, not surprising that there are vivid ongoing scholarly debates over when the rise of Salafism can be actually dated and thus of what and whom do we mean by “Salafi” referring to whether some modernist Muslim reformers, such as Muhammad Abduh, were in fact Salafis. If Abduh were to qualify as a Salafi, then that would mean categorizing him alongside Islamist groups such as Egypt’s present-day Nour Party, which was what Frank Griffel (2015) suggested in a heated debate with Henri Lauziere (2010) who, in turn, responds that “this is a false historiographical problem, because there is no need to frame the issue in terms of Salafism” (Lauziere 2016a; subsequently Griffel 2016). Reinhard Schulze (2000: 18), in turn, suggests the term “neo-Salafism” to describe modern Muslim activists like the founder of the Muslim Brotherhood in Egypt Hasan al-Banna (d. 1949) who, according to him, followed the “Salafiya movement ..., an Islamic variant of late 19th century classicism.”[101] Such a definition, however, is too broad, for it allows one to apply the term Salafi to any Muslim, regardless of his views on theology and law, who both sees himself as a modernizer and emphasizes the glory of the “pious ancestors.”

A caution is needed when dealing with so-called “modernist” or “enlightened Salafism, where many have got it wrong,” as Bernard Haykel puts it, for neither Jamal al-Din al-Afghani (d. 1897), Muhammad ‘Abduh, nor his disciple Rashid Rida (d. 1935) shared Ibn Taymiyya’s (d. 728/1328) anti-rationalist and literalist theological views on tawhid, or promoted hadith as unconditionally authoritative (Haykel 2009: 45-6). The views of such modernist Muslim reformists of the late nineteenth and early twentieth century are at odds with the beliefs and practices of both the adherents of what is known today as Salafism and their pre-modern inspirers.[102] A possible exception to pro-Wahhabi inclinations can perhaps be found in the late period of Rashid Rida’s life when he supported

‘Abd al-‘Aziz b. Sa‘ud (d. 1953) in Arabia and published some writings on that topic (Rida 1925).

Although some researchers look for the genealogy of Salafism in the early (Lauziere 2010: 380) or mainly in the late (Griffel 2015: 195; Weisman 2017: 34) nineteenth century, if we set aside the misleading ism in the designation, the intellectual trajectory of the modern movement can be traced back as early in Islamic history as the end of the eight and beginning of the ninth century ad and is related to the traditionalists (ahl al-hadith) - the hadith scholars of Baghdad. Scholars such as Bernard Haykel (2009: 28), Joas Wagemakers (2016: 30-2), and Jonatan A. C. Brown (2015: 118) support the idea that such a long-term trend in Islam eventually gave rise to what we today call Salafism.

The term traditionalists (ahl al-hadith) is used to refer to scholars who transmit or investigate traditions to establish the soundness of their authenticity. From the third/ninth century onwards, the term traditionalism in theology was also applicable to the ahl al-hadith who followed prophetic tradition as an authoritative source of religious knowledge and must be distinguished from those who followed ancient customs or unwritten traditions. Traditionalist doctrine, as opposed to rationalist theology, is based on three positive principles. First, traditionalists adhere to the Qur’an, the Sunna, and the consensus (ijma *). Second, they consider the religious content derived from these three sources to be homogenous. Third, traditionalists embrace those scholars who are responsible for the application of these devices. A negative principle is that they reject any innovation (bid'a).[103] In this sense, one should not necessarily see the Salafi orientation as a product of modern globalization and of the ongoing deterritorialization of Muslims (Haykel 2009: 36-37), but as embedded in the mode of scriptural engagement to which the third/ninth-century ahl al-hadith adhered. Indeed, transnational Salafism today fosters a process of deculturation in that Salafis are at war with locally embedded traditions and notions of culture (Roy 2004: 258ff.), although with some notable exceptions such as those areas in the Arabian Peninsula where Salafism itself - in its Wahhabi form - has been the dominant tradition for a long time.

In the third century ah, “the followers of the Prophetic tradition” (ahl al-hadith) [104] shaped as a religious movement considering the traditions (hadith) of the Prophet Muhammad as the main source of religious authority alongside the Qur’an. The hadith folk, to use the term that Marshal Hodgson (1947: vol. 1, 238) coined, were led by Imam Ahmad Ibn Hanbal (d. 240/855) against the “rationalists” (ahl al-ra’y) who adopted the theological views of Imam Abu Hanifa (d. 150/767) and the Mu'tazila, which influenced the Abbasid ruling elite for more than two decades after the time of Caliph al-Ma’mun (r. 198-218/813-833). Reminding us of Hodgson’s idiosyncratic translation of the name ahl al-hadith, Christopher Melchert (2002) analyzes their views delineating four most important features of traditionalist piety - seriousness; an overwhelmingly moralistic conception of the Islamic community; a contrast with Sufi piety; and a contrast with the piety of ahl al-adab (the cultivators of belles-lettres). [105] Shaped in the time of Ibn Hanbal, these features of traditionalist piety continued to

spread after the beginning of the tenth century ad, by which time the hadith folk had played their historical role in the Muslim convergence. In the next centuries, seriousness and conceptions about a moralistic community of the saved, as opposed to infidels and deviators from the straight path, combined with a sharp critique of any form of speculative intellectualism, kept their influence within certain Muslim schools and movements. The circle surrounding the paradigmatic proto-Salafi scholar Ibn Taymiyya (Bori 2010), and his influential disciple Ibn Qayyim al-Jawziyya (d. 751/1350) played a central role among them.

Ibn Taymiyya’s theology, often referred to as neo-Hanbalism or neo-Hanbali traditionalism (for example, El-Rouayheb 2015: 201, 272-311), passionately opposed and polemicized against the Murji’ite views of other Sunnis, particularly Hanafis and the followers of Ash'arite speculative theology (kalam). Ibn Tay-miyya revived and brought to the fore the principle of istithna’ as part of the search for a perfection of the faith (kamal al-iman) - a situation in which sins cannot harm faith as a whole - but he gave insufficient consideration to the conventional anti-Murji’ite stances that theologians like al-Ash‘ari (d. 324/936) himself would have adopted as compromises. According to Ibn Taymiyya, faith is not fixed; like other complex entities, it varies by increasing and decreasing (yazid wa yanqus), but keeps its nature and name even if part of it ceases to exist. Ibn Taymiyya distinguished between two categories of postponers - the more dangerous theological Murji’ites (murji’at al-kalam) and the jurisprudential Murji’ites (murji’at al-fuqaha’). The latter referred mainly to Abu Hanifa and his followers, whose errors Ibn Taymiyya more readily forgave (Ibn Taymi-yya 1995-2004: vol. 7, 323).

*** 3 Defining Salafism as a Mode of Scriptural Engagement

The Arabic-Islamic term Salafi, and hence the phenomenon of what is known today as Salafism, refers to a religious - mostly theological but also legal - orientation within the Sunni spectrum of Islam that is embedded in a specific mode of scriptural engagement. Salafism is mostly identifiable theologically through the creed (‘ aqida) with which their adherents passionately reject rationalist speculative theology (kalam), embracing instead traditionalist theology (^cilm al-usul or usul al-din).[106] The theological views embedded in the Salafi creed extend over the Salafi views on matters of Islamic law where they have legal consequences. The methods by which that specific combination of theological and legal views is implemented in religious practice entails varying implications for the socio-political engagement of those who belong to the different branches of Salafism.

**** 3.1 Foundations of the Salafi Creed

In a particular way, Salafis stress the need to return as strictly as possible to the beliefs and practices of the first three generations of Muslims - that of the “pious ancestors” (al-salaf al-salih) - or the initial two and a half centuries of Islamic history when a generation (jil) was perceived as around eighty years (Haykel 2009: 38-9). Some scholars emphasize “precisely the focus on the utopia of al-salaf al-salih” as a distinctive feature, which allows them to identify as Salafis the people who claim to follow the salaf “as closely and in as many spheres of life as possible” (Wagemakers 2016: 28). Salafis, however, shape their distinct Muslim subjectivity differentiating themselves from other Sunnis by privileging a set of specific beliefs and practices providing them with a strong sense of religious certainty.

If in Western modernity it is through reason and thought “that man escapes from the perils of uncertainty” (Dewey 1929: 6), under religious normativity individuals act differently in terms of agency, rational activity and subjective choice in that any legitimate human action must take into account the established and “firm” structural codes into account. Some anthropologists link certainty and religion by grasping fundamentalism as a refuge from uncertainty (James 2005: 1-16). Salafism inspires religious certainty in its adherents through the adopted direct approach to the textual sources of revelation, as well as through the claim that Salafis represent the most authentic form of Islam as it emerged at source - as it was revealed by Allah, evidenced in the life and sayings of the Prophet Muhammad, understood and practiced by his Companions (sahaba), their Followers (tabfun) and the Followers of the Followers (tab'fu al-tabfin), that is by the salaf, or first three generations of Muslims.[107]

Salafis are thus among the most ardent defenders of scriptural certainty in Islam. They consider that the salaf understood the Qur’an better than anyone else and whoever dares to contradict their reading is completely wrong: “we know that the Qur’an was read by the Companions (al-sahaba), the Followers (al-tabfun) and their Followers (tabfuhum) who best understood its meanings (ma'ani) and interpretation (tafsir)” (Ibn Taymiyya 1972: 91). In the field of religious knowledge, modern Salafis, who since at least the 1920s have been known as Salafiyya (Lauziere 2010: 373), as well as their forebears the proto-Salafis,[108] whose religious orientation is identifiable in matters of theology and law from the pre-modern age, passionately defend the standing of the early religious scholars (salaf) and are critical of the opinions of the later scholars (khalaf). Ibn Taymiyya who is an inspiration for generations of Salafi-minded Sunnis, thus insisted that the innovators (mubtadi'in) prefer “the path of the later philosophizing scholars” (tariqat al-khalaf al-mutafalsifa)” before “the way of the salaf” (tariqat al-salaf).

Theologically, what primarily identifies Salafis is their understanding of tawhid, God’s oneness and unity. This understanding refutes anthropomorphism and the physical attributes (sifat) of Allah, entails a particular approach to the texts of

revelation and, by setting thick doctrinal boundaries with clear legal consequences and political implications, is able to distinguish believers from unbelievers. Salafis do not simply adhere to “monotheism,” as the term tawhid is usually translated in Western languages in opposition to “polytheism” (shirk), which implies associating other divinities with the unity and oneness of Allah.[109] Salafis adopt the universally accepted belief among Muslims that God is not only One (ahad) but also undivided, united in Himself (wahid). However, the Salafi creed ('aqida) differentiates between three interrelated categories of tawhid.

The first category is tawhid al-rububiyya (the Oneness of Lordship), the belief in the single supreme and sovereign power of Allah as the sole Lord of Creation, thus implying that attributing any part of His power to anyone else amounts to unbelief (kufr). The second is tawhid al-uluhiyya, or tawhid al-ilahiyya (the Oneness of Godship), also known as tawhid al-‘ibada (the Unity of Worship), the conviction that - as only Allah is divine - all forms of worship must be directed only and exclusively to Him while worshipping anyone else but Him is a form of unbelief. The third category is tawhid al-asma’ wa l-sifat (Oneness of the Names and Divine Attributes), meaning that Allah is unique in all His names and attributes mentioned in the texts of Islamic revelation. In dealing with this aspect of revelation, Salafis pursue imrar or tamrir - accepting the anthropomorphic passages from scripture[110] as they are - “without modality and anthropomorphism (ma‘a nafi al-kayfiyya wa l-tashbih)” (Ibn Taymiyya 1995: vol. 1, 56o), which result in the danger of unbelief.

The terms denoting the first two categories of tawhid seem to have appeared in the time of Ibn Taymiyya; the second one (tawhid al-uluhiyya) is particularly important for enforcing Salafi views in practice and worship (Haykel 2009: 39n.14). The third category of tawhid discerns Salafis from other Muslims by strictly adopting the Hanbali view that the revealed texts must be accepted without asking how (bi-la-kayfa), without the middle way followed by the Salafis’ constant theological adversaries, the schools of speculative theology (kalam) such as the Ash‘ariyya and Maturidiyya (Wagemakers 2016: 41). Later, Muslim scholars and leaders like Muhammad b. ‘Abd al-Wahhab (d. 1792) laid particular emphasis on the tawhid al-asma’ wa l-sifat to strengthen the core distinctive elements of the Salafi creed (see, for example, Lauziere 2016b: 97-8, 132, cf. 210, 234).

Based on a theology of faith dealing with questions such as “what faith itself is, and how one believes” (Lav 2012: 4, emphasis in original), Salafis draw strict boundaries between belief and unbelief, which include legally consequential procedures such as accusations of unbelief (takfir) (Evstatiev 2015: 218-21). A cornerstone of Salafi theology is the view that works, or acts, are an integral part of the faith and, according to Ibn Taymiyya (1995-2004: vol. 4, 156):

the way of the salaf (madhhab al-salaf) is that faith (iman) constitutes of speech and acts (‘amal), [according to which] it increases and decreases (yazidwayanqus). ... The way of the salaf is that the Qur’anic verses and the hadith on the attributes (sifat) of Allah are not subject to interpretation (la tata’awwal).

This view opposes the stances of the Murji’ites (al-murji’a) calling for a suspension, postponement (irja’) of judgement regarding the third and the fourth caliphs - ‘Uthman (r. 23-35/644-656) and subsequently Ali (r. 35-40/656-661), who had been condemned as infidels by the early activist movement of the Kharijites (al-khawarij)[111] who played an important role during the first civil war (fitna) in Islam (35-40/656-661).

Thus, the Khariji belief that a rebellion against Muslim rulers was not just allowed but necessary if the ruler has performed a grave sin (kabira), collided with the Murji’i view of postponement of the punishment remaining solely in God’s hands on the Day of Judgement if the ruler in question explicitly considers himself Muslim. This long-term struggle between “seceders” and “post-poners” is paradigmatic in Islamic history and continues until today between the different branches of Salafism. However, this does not mean that Salafis who consider themselves at the heart of ahl al-Sunna wa l-jama^ca[112] should be analytically confused with the Kharijites - despite the quietist Salafis’ current intra-Muslim accusations against their jihadi counterparts (Wagemakers 2011). From an historical perspective, the politically motivated insistence of the early proto-Murji’a to suspend judgement on wrongdoing rulers gradually evolved into a mainly theological doctrine adopted by the Hanafi tradition (Cook 1981: 30). Although Imam Abu Hanifa is widely known among Muslims as jurisprudent and the eponym of one of the four established Sunni schools of law, he had he had also specific views in the field of theology. According to him, faith (iman) is an indivisible unity of belief and speech to the exclusion of acts and cannot therefore increase or decrease. Under pressure from certain Qur’anic texts, some later Hanafis allowed for an increase but not a decrease of faith - a view adopted by the Maturidi theology, which intertwined with the Hanafi legal school.[113]

Salafis put a particular emphasis on the religious distinctiveness of true Muslims and privilege Islamic imperatives that firmly set the boundaries of faith (iman) as opposed to unbelief (kufr). They fight unbelief, particularly all forms of shirk associating other beings or things with Allah’s oneness. Salafis claim that the only valid sources of authority are the Qur’an and the Sunna of the Prophet Muhammad (equated by Salafis with the six canonical hadith collections). Believing that, after the Prophet, his sayings are best understood by the consensus of his Companions (sahaba), Salafis seek to purify Islam from any reprehensible innovation (bid'a) (Evstatiev 2018: 171-202; Haykel 2009: 39).

On the one hand, in dealing with the sources of revelation, Salafis draw strict boundaries between belief and unbelief through “markers of doctrinal distinction” (Loimeier 2017: 39). On the other hand, due to the religious certainty it inspires, Salafism is very successful in achieving a high degree of internal communal consolidation and cohesion among the Muslim groups that adopt it. With its direct approach to the sources of revelation, the Salafi orientation guarantees a stable identity affiliated to the single and exclusive victorious group (al-ta’ifa al-mansura) that will protect the saved sect (al-frqa al-najiya) from hellfire in the hereafter. The view is based on a group of had-iths stating that Jews and Christians divided into seventy-one or seventy-two sects (firqa) while this community, the Muslim umma, will split into seventy-three sects, all of which but one will be doomed to hell. This exceptional saved group (jama’a) is also known as al-ta’ifa al-mansura or al-frqa al-najiya - a notion that draws on what is considered to be a sound and authentic (sahih) Prophetic tradition: “a group (ta’ifa) of my community (ummati) will continue to engage in battle for the Truth (yuqatiluna ^cala l-haqq) until the Day of Resurrection” (Muslim, hadith No156; cf. al Bukhari, hadith No7311; al-Tirmidhi, hadith No2229).[114]

The standing of the saved sect and the purification of the individual and society from any form of unbelief and innovation is maintained through a particular emphasis on a set of Islamic boundary-drawing imperatives, such as loyalty and disavowal (al-wala’ wa l-bara’). The phrase includes two elements: its first part denotes the unreserved loyalty that Muslims have for evidence of Allah, Islam and the Muslim community, while the second refers to the obligation to reject everything that is un-Islamic (Wagemakers 2008: 1). According to David Cook (2005: 141), “this is a polarizing doctrine by which radicals ... maintain their control over what constitutes the definition of ‘Islam’.’’ In a legal opinion (fatwa), the influential Saudi Salafi religious scholar Muhammad b. Salih al-‘Uthaymin (d. 2001), for example, by drawing on Ibn Qayyim al-Jawziyya, emphasized that “the greeting of infidels for Christmas (tahni’at al-kuffar bi-^cid al-krismas) is agreed to be forbidden (haram bi l-ittifaq). . This is a greater sin than greeting someone for drinking wine, committing a murder or an unlawful intercourse” (al-‘Uthaymin 1992: vol. 3, 45) and, if some Muslims tend to shun this Islamic imperative, Salafis use it to justify their call to minimize Muslim interactions with non-Muslims (Shavit 2014). A strict understanding of loyalty and disavowal characterizes the individual and social life of Salafi Muslims.

**** 3.2 Salafis in the Domain of Law

Although the theology embedded in the Salafi creed is what distinguishes it from other forms of Sunni Islam, its adherents also define themselves through a set of specific shared views on Islamic law developed in the field of jurisprudence (fiqh). Despite the emphasis on ^caqida, law can rival theology as the dominant concern for modern Salafis (Gauvain 2013: 11) whose purism engages them in shaping and maintaining a Muslim subjectivity that encompasses all aspects of individual and social life. In matters of law, Salafis generally tend to pursue la madhhabiyya - what

Griffel (2015: 205) translated as non-schoolism - meaning that Muslims with a knowledge of Islam should seek to transcend the boundaries of each of the four established traditional Sunni legal schools (madhhab s) - Hanafi, Maliki, Shafi'i, or Hanbali.

In jurisprudence (fiqh), therefore, Salafis emphasize the need to access the foundational sources of revelation directly - through independent reasoning (ijtihad) that bypasses the blind emulation (taqlid) of the chain of authorities within the separate schools of law. Although Ibn Taymiyya was also a mujtahid, he was more dedicated to matters of theology. His disciple Ibn al-Qayyim al-Jawziyya (2003: vol. 2, 11), however, explicitly formulated the need to transcend the madhhabs: “each of the religious scholars stuck to his authority and thus they made the fanatical adherence to the legal schools their religion (jalu al-ta'assub li-l-madhahib diyanatahum).” If on matters of theology they are traditionalists, in the field of law Salafis are thus markedly anti-traditionalist in that they contest the established Sunni legal schools.

The Salafi adoption of Hanbali credal, and indeed often legal, views is often mistakenly equated with their presumed following of the Hanbali school of law, which in principle is valid for the Wahhabis but not for all Salafis. Recent developments suggest that, even in Saudi Arabia, religious scholars ("ulama) are increasingly emphasizing ijtihad and tending to claim the status of mujta-hids more than their Wahhabi predecessors did in the past (Vogel 2000: 78). The eminent hadith scholar Nasir al-Din al-Albani (d. 1999), along with his disciples who adopted the name Ahl al-Hadith, are known to have had heavily criticized the Wahhabis for following Hanbali law (Lacroix 2011: 82-86). Al-Albani himself went so far as to say that Ibn ‘Abd al-Wahhab was Salafi in creed ("aqida) but not in jurisprudence (fiqh), thus accusing him of being insufficiently knowledgeable in hadith (Lacroix 2009: 68).

Another ubiquitous conceptual confusion is to equate Salafism with Wahhabism and to use the two terms interchangeably. This particularly happens in so-called security studies where the latter term is equated with violence (Meijer 2009: 2) and thus turned into a rhetorical foil (Knysh 2004). It is noteworthy that as early as 1929 King ‘Abd al-Aziz ibn Sa'ud officially prohibited the use of the term Wahhabiyya and declared instead that the legitimate term was Salafi-yya (Mouline 2014: 8). What is labeled Wahhabism is only one branch of the broader Salafi orientation in Sunni Islam and Ibn ‘Abd al-Wahhab was more engaged with questions of theology than with jurisprudence.

**** 3.3 Salafis and Political Engagement: Quietist and Activist Branches

In principle, all Salafis share a set of common basic views on theology and law where they achieve a high degree of convergence, but they diverge deeply over their use through the

adopted program, or method (manhaj) of applying that creed. In particular, while the method of dealing with the sources of Islam is probably “universally agreed upon among Salafis” (Wagemakers 2012: 8), there is deep disagreement among them over the proper manhaj related to worship (‘ibada) and the issues of society and politics. The influential Saudi Shaykh Salih b. Fawzan al-Fawzan (b. 1935), who among the religious scholars deals extensively with method, analyzes manhaj in a discussion about the reasons for the split (tafarruq) among Muslims (Fawzan 2005: 12), or more notably among Salafis. The theological and largely legal unity thus turns into diversity of Salafi sociability and the existence of often contradictory approaches to society and politics. This feature strengthens Salafism’s nature as essentially contested concept and underlies the scholarly attempts to classify and categorize the branches of the movement.

The most widely accepted classification divides Salafis into three categories, two of which are activist and one quietist;[115] variations in the designation depend on the disciplinary background of the respective author. Initially, this broad threefold classification was proposed and elaborated by the political scientist Quintan Wiktorowicz. He divided Salafis into purists, politicos and jihadis, defined according to what he called their “different contextual readings of a shared creed” (Wiktorowicz 2006: 208). As we shall see, the first of the three is quietist while the next two are activist, though in a manner that does not allow one to presume that jihadis necessarily originate within the circles of the politicos or vice versa.

Wiktorowicz’s purists comprise the religious figures who focus mainly on maintaining the purity of Islam in accordance with the Salafi creed. They emphasize the missionary call (daWa) to what they believe is the true Islamic teaching. They stay aside from current political affairs, the struggles for power and party politics (hizbiyya), which, in accordance with Islamic doctrine, they consider a prerogative of the Muslim ruler (wali al-amr).[116]

Among the prominent purists was the above mentioned Nasir al-Din al-Albani, who brought his principle of “purification and education” (tasfiya wa tarbiya) to the fore: “without these two introductory steps,” al-Albani (2000: 31) clarified, “it is to me impossible to lay the foundations of Islamic rule or Islamic state.” Ironically, this Salafi scholar was known to have said something originally stated by Hasan al-Hudaybi (d. 1973), the Supreme Guide of the Muslim Brotherhood (Olidort 2015: 16) whom he passionately opposed, namely “build an Islamic state in your hearts and it will be established for you in your land” (al-Albani 2000: 33). Apart from influential Saudi shaykhs such as ‘Abd al-Aziz b. Baz, Wiktorowicz’s purists also included religious scholars like Muhammad b. Salih al-‘Uthaymin and Rabi‘ al-Madkhali (b. 1931), who reject even peaceful engagement in party politics.

Some researchers found Wiktorowicz’s term purists inappropriate because all Salafis self-identify as purists, so suggested replacing it with the word qui-etists.[117] Aware of these

debates, others chose to keep to purists instead of quietists on the grounds that attitude to political participation alone does not differentiate purists from politicos (Pall 2018: 19). In a detailed revisiting of Wiktorowicz's categorization, Joas Wagemakers (2017; also 2016: 52-59) elaborated on the term quietist and proposed modifying the classification synthesizing some insights already available to Islamicists in which the term quietists had previously been used to describe this category of Salafis (Meijer 2009: 3ff.).[118] Wagemakers (2017: 16) thus proposed three sub-trends within the quietists - aloofists who remain completely aloof of political action, for example al-Albani; loyalists who refrain from direct active political engagement but are ready to counsel rulers like Ibn Baz and al-Uthaymin; and propagandists who actively propagate their loyalty to a regime, one example being the Saudi Rabi' b. Hadi al-Madkhali.

Apoliticism is perhaps the most contested concept within the quietist branch. Refuting that the notion of quietist could be applied to al-Albani, Jacob Olidort contended that political realism was a more appropriate term than quietism because al-Albani and his disciples had constantly touched on political issues and, in fact, had had a clearly political agenda. Olidort (2015) was therefore critical of Wagemakers for implicitly suggesting that "quietists avoid political discussions." Wagemakers later addressed that criticism by stating that it had been a misunderstanding of his work, for he had never made such a claim but rather meant that quietists "avoid political action and only write about political issues such as the Palestinian question and the war in Syria as religious issues pertaining to things like piety and doctrine, not political interests and the like" (Wagemakers 2016: 53, emphasis in original). This debate indicates that, however quietist they might be, Salafis pursue their reformist project through Muslim politics that can avoid any formal and institutionalized structures such as modern political parties or associations.

Salafis are primarily religious and social reformers wishing to reproduce specific forms of personal and communal identity and authority with a view, as Haykel (2009: 34-35) put it, "to create a distinct Muslim subjectivity, one with profound social and political implications." Salafis do not necessarily see politics as centered on power relations and interests alone, as they cannot account for how people interact with society. For them, as for other Muslims, politics is also "a struggle about people's imaginations" (Pekonen 1989: 127-43; see also Eickelman and Piscatori 1996: 9). Overt political struggle is framed by implicit understandings of belonging that can often mean withdrawing from power relations and direct political participation. Michael Cook (2004: 113), for example, defined the ambivalence in Ibn Hanbal's quietism as apolitical politics. Quietist Salafis, in turn, are not disinterested in politics.

The second category of the threefold classification that Wiktorowicz (2006: 221-25) suggested includes the "politicos" (or "political Salafis" in Wagemaker's modification) who gained momentum from the 1960s. They adhere to a politicized manhaj that originated historically out of the entanglement between the Saudi Salafis and members of the Muslim Brotherhood from Egypt and Syria, who entered the kingdom seeking refuge from the secular, authoritarian regimes in their own countries. The Salafis of this category consider political activism as a requirement of the method for the application of their creed

and believe that this is the proper way for them to contribute for achieving social justice by implementing the right of God to legislate. Saudi Arabia's twin shaykhs Safar al-Hawali (b. 1950) and Salman al-Auda (b. 1956) - both students of Ibn Baz - are leading political Salafis.

A particular sub-trend is embodied in the activity of Abu 'Abdallah 'Abd al-Rahman b. Khaliq (b. 1939) - an Egyptian Islamist who graduated from the Islamic University of Medina but moved to Kuwait after the Saudis expelled him due to his extreme activism. His group is sometimes referred to as "organized Salafism" (Haykel 2009: 58) because of al-Khaliq's insistence on coordinated actions with the aim to gain political power. These tendencies were fostered by a movement known as Sahwa - the Islamic Awakening (al-sahwa al-islamiyya), or in Saudi Arabia called among some circles in the country "Sahwa insurrection" (intifadat al-sahwa) - a predominantly non-violent religio-political movement (Lacroix 2011: 3). The Sahwa movement reached its peak in the early 1990s, but there are contending visions of who precisely fostered the process. Authors like Kepel (2004: 152-96) emphasize the role of some members of the Muslims Brotherhood who immigrated to the Kingdom from Egypt and Syria pointing to the influence of leading Islamists, such as Muhammad Surur (b. 1938), on the Saudi Wahhabi milieu. Others tend to evaluate the role of these immigrants as less significant, so privilege the role of local Wahhabi factors as drivers behind the Sahwa. Madawi Al-Rasheed (2007: 73-4) contests Kepel's opinion, which she sees as coinciding with the view of the Saudi regime. In some other Middle Eastern countries like Egypt, especially after the so-called Arab Spring, political Salafism took parliamentary forms and the aforementioned Nour Party with its enormous electoral success is a typical example (cf. Lacroix 2012: 2-12).

The third category involves the jihadis (Wiktorowicz 2006: 225-28), increasingly known as Jihadi-Salafis (Haykel 2016). They are part of the dynamic jihadi current that self-identifies as "the school of jihadi Salafism (madrasa al-salafiyya al-jihadiyya)," or simply Jihadi-Salafism (al-salafiyya al-jihadiyya) (Bunzel 2017), to which the militant Sunni groups such as Al-Qaeda and the Islamic State (is) in Iraq and Syria adhere. All Salafis, and in theory all Muslims, recognize the Islamic duty of jihad, at least in its normative religious sense of missionary warfare (Crone 2004: 364-5, 369). What then differentiates JihadiSalafis? Traditional Sunni jurisprudence stipulates that at least once a year a caliph must wage offensive jihad (jihad al-talab) against infidel powers to expand the domain of Islam and in that capacity jihad is a collective duty. Defensive jihad (jihad al-daf) is an individual duty incumbent on every eligible Muslim if the realm of Islam is under external attack. Some Jihadi-Salafis elaborate on the traditional notion of defensive jihad (Bunzel 2017: 7), but what makes them distinct is their view that jihad is to be conducted not only against infidels but also against the apostate regimes in the Muslim majority countries themselves.

This particular activist stance of armed confrontation against an unjust ruler (Cook 2004: 51) - together with the call for global jihad by groups such as Al-Qaeda - differentiates between the Jihadi-Salafis on the one hand, and the quietists and political Salafis on the other (cf. Wagemakers 2012: 9). Ibn Tay-miyya (1995-2004: vol. 28, 421) also emphasized that jihad is the best way for a man to strive towards cleansing himself of all his previous sins:

whoever has many sins (kathir al-dhunub), the best medicine for him is jihad. Those who want to be eased from what is forbidden (haram) and repent but are unable to turn to his fellows, let them take the path of Allah, for this is the best way towards his salvation, among other things, which he will obtain from the reward ofjihad.

Those who take this path and join jihadi groups do not, however, engage only in military activities. The fighters with their families develop a distinct jihadi culture in which religion provides the predominant theme and inspiration, but that also includes jihadi poetry in Arabic, Islamic songs (nashids) and films. In a study of the non-military activities of jihadis, Thomas Hegghammer (2017: 178) emphasized that, since they take their religion extremely seriously, they are first and foremost preoccupied with devotional activities - prayer, invocations, Qur'an recitation, and ablution. To gain a real understanding of Jihadi-Salafism would therefore require further study of its religious aspects without neglecting the other factors that have driven the rise of the jihadi movement - be they social or psychological.

The social and political issues underlying the categorization of Salafism are, no doubt, important, but the blurred lines between the different groups that enable a former quietist to join the Jihadi-Salafi movement suggest that one cannot overemphasize the importance of this contested classification for our understanding of the phenomenon. The most distinctive features of Salafism, those that make it attractive to Muslim over other religious trends in Islam, are rooted not in the classification but in the specific shared creed. Moreover, it is not only the Western observers who are contesting the categorizations, but also the Salafis themselves. Ali al-Halabi (2011: 49-51), a Jordanian Salafi leader and disciple of al-Albani, noted that only ignorant people and innovators (ahl al-jahl wa l-ibtida *) can speak of branches of Salafism (anna l-salafyya an-wa) for "Salafism is, in fact, an inherited divine method (manhaj rabbani mu-tawarath) that the later scholars (khalaf) have received from the early scholars (salaf)." These disagreements stem from a shared Salafi belief that there is only one proper manhaj for the application of their creed.

*** 4 Conclusion

Salafism is an essentially contested concept for which there are irreconcilable arguments about its right usage. It stirs heated discussions and constant disagreements among both Western scholars and Muslims of different backgrounds. That, however, does not mean that scholars should embrace a relativist stance by declaring the term indefinable. If we resort to Walter Gallie's example of the oil-tempera painting versus the work of art, we will need to admit that the ambiguities around Salafism encompass both types.

Alongside widely shared agreement on the scope of the concept of Salafism as understood today, is deep disagreement over its proper use and realization. Among scholars, Salafism is a highly challenged concept that provokes bold controversy surrounding its origin, along with much confusion and heated debate over who might qualify as a Salafi. Furthermore, classifications of Salafism are continuously being contested by secular and Muslim scholars alike. From within the field of Islamic studies, I have attempted to show how the ambiguities of the “oil-tempera painting” might be solved in such a way that the contradictions in our understanding of Salafism as a Sunni religious orientation based on a specific mode of scriptural engagement in the longue duree of Islamic thought and practice become less perplexing.

As any essentially contested concept, Salafism seeks to preserve its continuity with the earliest time of Islam from where its adherents believe they derive its religious legitimacy. This effectively makes the boundaries of the Salafi spectrum narrower than those of other trends in Islam. The many newcomers now joining the Salafi movement might be inspired by a variety of subjective reasons, but for them it involves an objectification of the religious imagination. They pose questions about being in the world and wanting to be committed. What happens subsequently to those committed believers may vary depending on different factors, but as soon as they join the Salafi movement, most of them are likely to find themselves in a structural situation. Many might have thought beforehand that Salafism is what they do with it and that it can be endlessly changed and renegotiated. Most probably, however, they will quickly learn what their general commitment to Salafism requires them to do.

* Part 3: Change

** 9. Religiosity, Men of Learning, and Oil Wealth in the Land of the Imamate

Mandana Limbert

It is sometimes difficult to remember that in 1978 and 1979, when Dale Eick-elman first went to Oman, Sultan Qaboos bin Said al-Bu Saidi had only been in power for eight or nine years and that hope, excitement, change, and, undoubtedly, a fair amount of uncertainty and suspicion dominated Omani life. Certainly, as I write this essay, an enormous amount has changed in the village and then town of Hamra where Eickelman focused his

ethnographic work. The increase in population size alone has been dramatic. In an article published in 1983, Eickelman refers to the population of Hamra in 1980 as 2,510, which was significantly more than the 1,200 calculated in the late 1940s, and yet about eight to ten times smaller than its population in 2019. And yet, Eickelman's descriptions from his first visits not only remind us of the challenges and sentiments of the time, but also remain hauntingly familiar, continuing to raise significant questions about the processes and meanings of religious life, the production of knowledge, and the ways material transformations shape, but never determine, social expectations and experiences.

This chapter reflects on Eickelman's work in Oman beginning from the late 1970s and early 1980s to recognize his insights about religiosity and the possibilities of an anthropology that would engage seriously with religious scholarship, oil wealth, history, and technology and of conducting field research in the Arabian Peninsula. In particular, this chapter traces some of Eickelman's work in Oman and his exploration of notions of tradition, objectification, and the conditions of life in a dramatically transforming petro-state.

*** 1. Religious Tradition and Religious Objectification

Throughout his scholarship, and as it became particularly evident in his work in Oman, Eickelman approached Islam and religion rather differently than most in his field at the time. For Eickelman, religion was neither an a priori (much less a bounded) set of practices or discourses pertaining to beliefs in supernatural powers as it had once been defined in anthropology, nor a system

of symbols that produces "moods and motivations in men by formulating conceptions of a general order of existence and 'clothing these conceptions' with such an aura of factuality that the moods and motivations seem uniquely realistic" (Geertz 1973: 90). For Eickelman, "religion" is a host of experiences, practices, and discourses that come to be understood as such within and through processes of authority and legitimacy that are never isolated from (though not determined by or attributed solely to) the socio-economic and political hierarchies of a society. In some ways, Eickelman seemed to distance himself from the noun "religion" (except when understood as part of a process of definition), preferring, instead, either the adjective "religious" or the noun "religiosity" in order to emphasize ways of being religious or pious, rather than an a priori object or form with any particular presumption about content.

Eickelman's first article about Oman, "Religious Tradition, Economic Domination and Political Legitimacy," published in Revue de l'Occident Musulman et de la Mediterrannee, rests on such an argument. Drawing on a comparison between his earlier research in Morocco and his subsequent research in Oman, the article focuses, first, on the notion of Islamic tradition. It should be remembered that anthropology had - through the 1970s - been primarily concerned with local variations and practices presumed to be mostly oral and far from the scholarly orbits and debates that were of interest to historians and Islamic studies scholars. A few anthropologists, including Eickelman, were interested in

the importance of scholarly learning and texts as well as the significance of Islamic centers and practices of intellectual life. Certainly, the Islamic revolution of 1978 and 1979 in Iran had affected how anthropologists like Eick-elman understood and approached Islam as not confined to local practices and beliefs. Anthropologists were increasingly, though tentatively, recognizing the potential political relevance of religious life and the ways that textual and scholarly practices shaped everyday understandings of appropriate piety.

Beginning with a discussion of the ways that “traditional Islam” had been taken to refer to particular practices and formations that diverged from a supposed true, essential Islam, Eickelman called for a more complex understanding of tradition. In particular, he approached tradition as ideological and reproduced through men of learning. He proposed considering tradition (like religion) to be “an analytic notion which designates an ideological type with specific relations to local social structure” (Eickelman 1980: 17). As his previous work in Morocco (Eickelman 1978) had illustrated, however, the practices of the men of learning did not necessarily correspond completely with social structures. Thus, while recognizing the significance of context for knowledge transmission, Eickelman had also highlighted the varied and multiple ideologies among the men of learning.

Talal Asad, famously, was also concerned with the idea of tradition. In his 1986 article, “The Idea of an Anthropology of Islam” Asad developed his description of Islam as a discursive tradition. The article was aimed first and foremost at questioning presumptions, like those of Ernest Gellner, that Islam was a religion in which people did not generally seem to speak or think, but simply acted or behaved (Asad 1986: 8). Asad critiqued too the idea that Islam was divided into a binary social structure organized around a duality between city and country, shari'a Islam and tribal Islam. He developed instead, the idea of Islam as a discursive tradition to emphasize the founding texts of the Qur’an and hadith. In the 1986 article, Asad also critiqued Geertz’s (1968) approach to Islam in Islam Observed as primarily centered on behavior.

While in most of this 1986 piece, Asad focused on the significance of discourse in Islam, rather than behavior, he also engaged with the idea of tradition. He argued for an approach towards Islam that recognized it as “a tradition of Muslim discourse that addresses itself to conceptions of the Islamic past and future, with reference to a particular Islamic practice in the present” (Asad 1986: 14). As such, Asad emphasized the ways that tradition allows for both the weight and views of the past (and future) in the present, without remaining simply imitative. Indeed, as Asad wrote, Islam both carries pasts and addresses conceptions of it. Though Asad did not use the term “ideology,” as Eickelman had previously, he also, like Eickelman, distanced himself from a priori descriptions of content. Instead, Asad praised Eickelman’s call in “The Study of Islam in Local Contexts” to recognize and examine the middle ground between scholarly, ideal Islam and local variation. As some scholars, such as Yasmin Moll (2009), have noted, though Asad acknowledged shifts in interpretation and transformations in practice and recognized the significance of conceptions of pasts, his work has primarily been referenced to highlight the enduring legacies of intellectual and philosophical strains from medieval Islamic debates into the contemporary period.

Though notions of tradition continued to undergird some of Eickelman's questions about religiosity, as I note below, his work in interior Oman focused instead on different aspects of religious life. In particular, he analyzed the practices of authority and legitimacy in the former Imamate region and explored the processes through which Omanis increasingly came to see religion as a distinct realm of life and Ibadism (the branch of Islam dominant in Oman) as a particular identity. The question of what constituted religion and proper religiosity for Omanis dominated his work.

Eickelman saw in Oman some of what Clifford Geertz had argued in Islam Observed, though this is not always explicit: that there was a marked shift in religiosity from religiousness to religious-mindedness, a shift from "being held by religious convictions and holding them," especially with the rise of scriptur-alism (Geertz 1968: 61). The primary question that Moroccans and Indonesians were asking themselves, Geertz had argued in Islam Observed, was no longer "what shall I believe?" but "how shall I believe it?" Geertz (1968: 62) continued, "the transformation of religious symbols from imagistic revelations of the divine, evidences of God, to ideological assertions of the divine's importance, badges of piety, has been in each country [Morocco and Indonesia], though in different ways, the common reaction to this disheartening discovery." For Geertz, the "disheartening discovery" was that the depth and breadth of religious belief (not its validity) may have limits, and therefore demanded responses outlining how to be properly pious. It should be noted that while Asad critiqued Geertz's approach to religion and the ways Geertz (and Gellner) had approached Islam primarily through behavior, Eickelman drew from a somewhat different aspect of Geertz's work.

Instead, Eickelman focused on the increase of what Geertz had called religious-mindedness (a term Eickelman used in his 1987 article, "Ibadism and the Sectarian Perspective," discussed below) as well as the growing significance of self-defining and religious identity. Such processes of increasing religious-mindedness (and what Eickelman argued amounted to objectification), he noted, were strengthened and solidified as Omanis responded to criticism about their branch of Islam and sometimes with the evocation of tradition. Eickelman explored religious transformation and objectification more fully in his 1989 article, "National Identity and Religious Discourse in Contemporary Oman," and in the 1996 volume, Muslim Politics, co-edited with James Piscatori.

Distinctions between scholars who have emphasized the evocative power of tradition and those who have emphasized continuities also manifest around the notion of objectification and other concerns. In Politics and Piety (2005), for example, Saba Mahmood critiqued Eickelman's emphasis on objectification in his arguments about modern self-reflexivity, arguing instead that ethical religious pedagogies already and historically required self-reflection. In Questioning Secularism, Hussein Agrama (2012: 11) argued that Eickelman's approach to Islam not only treated tradition as ideology, but also began with an assumption that Islamic religiosity was "a problem to be explained." Certainly, the word "problem" is ambiguous, implying on one end a negative condition or situation to be

corrected and, on the other, a question that may be answered or, should at least, be asked. Agrama seems to suggest here that Eickelman and Piscatori used the former definition of "problem," rather than the latter.

Agrama, however, also noted his appreciation for Eickelman's attention to some of the processes of objectification that have been central to Eickel-man's work - the "tendencies to rule-generalizing and codification, expansive

ambitions towards social reform, the subjection of broader and more intimate spheres of social life to critical scrutiny and intervention, and a suspicious and increasingly strident politics of authenticity" (Agrama 2012: 17). For Eickelman, claims to and evocations of tradition were heightened in Oman by a new education system that also helped shape the tendencies to rule-generalizing and increased the strident politics of authenticity.

In addition to his attention to the politics and processes of tradition and objectification, Eickelman's ability to tackle some deeply held (and persistent) stereotypes about political systems in the Arabian Peninsula, to question presumed distinctions between religious and secular rule (in the Omani Imamate), to engage with religious and political history in Oman, to pursue research in a petro-state as well as to pave the way for further inquiry through his attention to ethnographic detail have remained especially influential for scholars of the Middle East and the Arabian Peninsula. In his first article about Oman, "Religious Tradition, Economic Domination and Political Legitimacy," for example, in addition to tackling the notion of tradition, Eickelman (1980) also questioned presumptions about political and religious forms that perpetuated ideas of static social structures, segmentary models of social relations, and systems of political legitimacy and rule in the Arabian Peninsula.

Though few in number, scholars of Ibadism - the branch of Islam dominant in Oman - were trained in classical Islamic studies and focused on doctrine. In Europe, such work had been centered in Poland under the direction of Ta-deuz Lewicki, in England with the work of John Wilkinson at the University of Oxford, and in Italy at the University of Naples. Italian colonial experiences in North Africa had fueled fascinating work on Ibadism. Wilkinson's first book on Oman, Water and Tribal Settlement in Southeast Arabia (1977), as well as his slightly later book The Imamate Tradition in Oman (1987), were the first extensive English language accounts that drew on Omani sources of Imamate Ibadi history, not only for its early history, but for the nineteenth and early twentieth centuries as well. As part of a shifting field of an anthropology that engaged the intellectual world of Islam, Eickelman did not shy away from considering the significance of scholarly training in Islam or from tackling the ways that scholars of Ibadism and Ibadi history in Oman had linked Ibadism and Ibadi history to a supposedly static social structure, the "tribe."

Thus, the second half of Eickelman's 1980 article unpacked presumptions about links between Oman's religio-political history (of presumed "cycles" a la Ibn Khaldun) and a

seemingly fixed segmentary model system that had been advocated by Wilkinson. He pointed out the speculative nature of such links, the ideological basis of descent, as well as the changing conceptions of “personal and collective obligations and identity.” (Eickelman 1980: 25) And, he provided a brief lesson (to scholars who were in the habit of drawing on notions of social structure from an imagined anthropology) on what anthropologists actually tend to do: “the task of the anthropologist then is not so much to hazard a reconstruction of “definitive” earlier identities, but to elicit the ongoing transformations of cultural forms and their relations to the economic and political contexts in which they occur (1980: 26).” Finally, Eickel-man questioned Wilkinson’s argument that considered “later” (that is, after the tenth century ce) Ibadi interpretations and practices as divergent from the “original.”

*** 2. Being Good, Being Ibadi

Within the next thirteen years, Eickelman published no less than seven more articles and book chapters about Oman, primarily about religiosity, authority, the transmission of knowledge, and scholarly practices. Eickelman’s detailed description in “Religious Knowledge in Inner Oman,” published in 1983 in the Journal of Oman Studies of religious knowledge and education in the village of Hamra exemplifies his extensive engagement with legal and literary traditions, political history, and questions about transformations in identity. In this article, Eickelman described the system of training, as well as the formation of the scholarly and governing authority of the Imamate administration in interior Oman, primarily in the 1940s and 1950s, with some continuing practices through his time in the late 1970s. And, Eickelman considered the false dichotomy between “religious” and “secular” rule, pointing out that there was no such distinction in Imamate governing.

The article, it should be noted, begins with a quote from a 1917 letter from Imam Salim bin Rashid al-Kharusi to Shaykh Muhammad bin Salim al-Ruqayshi entrusting him to serve as his governor and to rule in accordance with Islamic law and the tradition of Caliph ‘Umar’s instructions. Here, Eick-elman was particularly interested in exploring how legitimacy and authority were established, conferred, and maintained, and how histories of scholarly practices informed those processes. Such evocations of tradition were clearly not “false” claims to authenticity. From an outline of Quranic schools as he observed them and was told about during his time in Hamra in 1979 and 1980, and the ways that literate men helped train their sons, Eickelman drew attention to scholarly status and hierarchies, including for those who became government employees. He described how there had been little emphasis on literacy, though certainly a small number of “men of learning” formed study circles and taught others the core topics of grammar and law. A system of reputation that conferred respect on scholars was sufficient recognition to proceed to teach others. The question most significant for Eickelman was the differences between these forms of conferring authority (and the types of knowledge admired), and those emerging later, not to mention the calls to “tradition” and “authenticity” as they became increasingly important in the “modern” world of Omani schools and Omani political life.

As suggested above, while literacy was limited, religious scholarship clearly mattered. Yet, for most inhabitants of towns like Hamra, what truly mattered was how to live life as a good person ought to live life, not in order to live that life as defined by the object “Ibadism” as distinct from other religious groups or according to absolute boundaries of required practice. To be sure, historians of the nineteenth century have noted the energy and extensive publishing endeavors of Ibadis in Oman, North Africa, and Zanzibar as they aimed to explain, defend, and protect its presence, thereby also working to define it. Indeed, many contemporary Omanis who have turned to such acts of selfdefinition have done so by drawing on texts and debates from the late nineteenth and early twentieth centuries. That said, clearly, self-defining as Ibadi (or even Muslim) became more significant among a great number of people in the late twentieth century. Eickelman’s 1987 article “Ibadism and the Sectarian Perspective” might best exemplify his continuing interest in the processes noted above. Here, Eickelman described the ways that “in Hamra, for example, it remains the case that no activities are specifically bracketed as ‘religious’ ” (Eickelman 1987: 35), suggesting too that the category religious would itself have little meaning, as would a category like secular. Instead, what mattered was being a good person and living in accordance to values and proper practices, attested in texts and debates, that pertained to all aspects of life. And here too, he described the lack of interest in sectarianism.

This lack of interest in sectarianism (and self-defining) would soon change, however. As he explored in his subsequent article published in 1989, “National Identity and Religious Discourse in Contemporary Oman,” the Saudi national mufti Shaykh ‘Abd al-Aziz Bin Baz inadvertently sparked a “quiet revolution” in Oman. When Bin Baz issued a fatwa in 1987 criticizing Ibadis, Oman’s national mufti Shaykh Ahmed al-Khalili responded with a two-hour televised lesson defending and outlining Ibadism. I should note that ten years later, when I was conducting fieldwork in Bahla, this exchange between Bin Baz and al-Khalili continued to resonate, with almost visceral responses about the offence caused by the Saudi fatwa and its false understanding of Ibadism, not to mention the offence caused by their personal interaction in 1986 in Saudi Arabia. By 1989, as Eickelman explored in his article, rather than simply being a good person, defining and delimiting Ibadism and religion had become the guiding principles of Ibadi scholarship and debate. And, as Eickelman argued, the process of objectification was not only affirmed by al-Khalili’s lecture and subsequent publications and recordings, but reinforced through modern, mass schooling, which had actually downplayed sectarian differences.

As Eickelman (1989: 11-12) wrote:

an unintended consequence of making Islam a part of the curriculum is implicitly to make it a subject alongside others that must be “explained” and “understood.” Indeed, the defining of Islam, “explaining” it alongside other subjects, confines and objectifies it. However, treating Islam as a system of beliefs and practices implicitly also highlights differences within the Muslim community.

In other words, the introduction of Islamic studies as a separate subject in schools created boundaries between religion and other aspects of knowledge and life. And, despite the fact that the content of the material about religion in the curricula sought to downplay sectarian differences, the very form of religious education that defined religion as a system of belief and practices shaped expectations about delineating the differences of those beliefs and practices among different branches of Islam as well.

*** 3. Oil Wealth and Development Futures

While the majority of Eickelman's work in Oman analyzed what came to be religious life, Eickelman's work in Oman took on a different focus in another short article from 1983: "Omani Village: The Meaning of Oil" published in John Peterson's edited volume The Politics of Middle Eastern Oil. Here, Eick-elman (1983b) considered what the dramatic changes that villagers in Hamra were witnessing meant for them, thereby quietly articulating a revolutionary idea: that the politics and economics of oil could be examined from the perspective of everyday life, and not simply through the lens of sociological theories and models of the resource curse or wealth discrepancy and expectations, as had been the more common approach in studies of oil. Scholarship on oil need not, in other words, only be understood through the lens of geo-politics or tied to political loyalty. Instead, oil meant something for people in relation both to their understandings of the dramatic transformations around them and for how they understood their pasts, and futures. Eickelman, of course, was also highly attuned to the ways that the meanings of these transformations were hardly isolated from national representations of them, though this was not emphasized in his 1983 article. He focused instead on people's commitments (or claims of commitment) to community and village life, while remaining somewhat reluctant or even suspicious about the lure of elsewhere and relieved to be living in relative economic stability rather than under the strains of life just a few years earlier.

Oil, therefore, was not simply a commodity whose effects on politics and social relations should be examined exclusively in terms of its internal use, export, and conflict over the distribution of its claimed profits or the purchasing of relative docility. Oil was, and is, more than that; it means something in relation to other discourses about home, neighbors, family, not to mention interpretations of the past and future. In other words, oil enters a process of signification in which people's understanding of its presence (or even seeming absence) shapes how they see and act in the world. From Eickelman's ethnographic attention to oil, one could also begin to imagine how the process of signification, the meaning of oil, was and is not isolated from either national representations of it, nor from the skepticism, conflicting discourses, and practices surrounding its exploration, production, transportation, projections, and limits.

Nor is oil isolated from the material transformations that altered practice, sensory experiences, and histories - both official and unofficial. For me, the meaning of oil in Oman was also particularly evident in the materiality of "development," its infrastructure. Paved

roads, for example, have served an enduring national metonym for oil wealth and progress. State-sanctioned newspaper articles as well as popular Facebook posts exalting the engineering feats of road construction and “clean,” lighted, trafficless movement have, fifty years since the 1970 coup d’etat, not been uncommon. And, there have been reasons for this - the comfort and ease of travel on paved roads, rather than over graveled paths, cannot be overestimated, nor can the significance of travel itself for life in the twentieth and twenty-first centuries. Just as train travel, as Wolfgang Schivelbusch (1977) so beautifully described in The Railway Journey, altered people’s experiences of space, time, and sociality in the nineteenth century, so too has travel in cars, over perfectly asphalted mountain passes and even on congested highways. But, the meaning of oil is also evident in glistening airconditioned malls in urban centers, the desire for ready-to-wear (rather than locally tailored) fashions, and the availability of imported houseware, canned goods, as well as other imported foodstuffs (even coffee from Costa Rica) that have replaced locally produced crafts and foods. And, of course, such infrastructure and material goods could disappear in the future.

In his brief article about oil, Eickelman’s great attention to ethnographic detail paves the way for further inquiry. For example, here, he also mentioned loans, land, ethics, and futures. Eickelman wrote,

most of the minute parcels of land, some no more than two meters long and one wide, are locally owned and bought and sold only within the community. Yet, now as in the past, some land and water rights were transferred out of necessity to shaykhs of Hamra to raise cash in years of particular scarcity, and repurchased whenever possible.

Thus, as Eickelman extended the significance of oil to include property relations and changes in land-sale practices and, possibly, loans, one could ask: why were the parcels of land so small? Inheritance of course comes to mind, but these parcels may have also served as sources of loan sales. Why were they only bought and sold within the community? Or, if to shaykhs in Hamra, how was the repurchasing organized? In other words, what, exactly, were these sales? Were they the khiyar ones that Fahad Bishara (2016) has more recently described? How has oil affected land purchases, much less waqfs? Eickelman’s careful attention to ethnographic detail, as with his detailed attention to the scholarship surrounding Ibadi political life, has opened expansive lines of inquiry for those engaged with the complexities of life in Southern Arabia.

Eickelman also raised questions about local ethics and the social importance of remaining oriented to the village in the 1970s and 1980s. As Eickelman and others have noted, the 1970s not only witnessed emigration from villages to Muscat and other cities of the Gulf, but Oman was also experiencing the dramatic “return” of Zanzibaris after the 1964 revolution. Thus, one wonders whether the ethics of orientation to locality, as noted by Eickelman, might also have been linked to the intensity of such mobility and discussions about movement at the time.

Finally, in the brief 1983 article about oil, Eickelman addressed questions about the future, though here he asked broadly and openly what kinds of future Omani villagers imagined or hoped for as they saw their current world being transformed so dramatically around them. One could, of course, also ask what notions of the future and temporality might there have been or be, as has been (like roads and other infrastructural changes) of particular interest to me. How has the oil industry and the Omani state, for example, helped shape notions and uncertainties about the future through the public focus on depletion, and how have those ideas drawn on other experiences or accounts of the past as well as discourses about the limits of human knowledge itself? One could take such questions even further, as Gukge Gunel (2019) has in her study of the futuristic Masdar eco-city in Abu Dhabi, both as an experiment for post-oil economic sustainability in Abu Dhabi and for practices of science and scientific knowledge.

*** Conclusions

Eighteen years after Eickelman first went to Hamra, I was fortunate to spend almost a year and a half in Bahla, a town approximately thirty kilometers away from Hamra. I was fortunate not only because a generous family was willing to accept me - a single, female, foreigner who undoubtedly interrupted their lives - into their home for so long, but because reading Eickelman's work introduced me to the depth and richness of scholarly life of the villages and towns in the region and the ways that the world of the Imamate was both present and yet its legacy never static. Though clearly much had changed between Eickelman's first visit and his later visits, as well as between the late 1980s and the 1990s, the self-defining was palpable as was the continued lived memory of the Imamate. By the first quarter of the twenty-first century, the world of the Imamate may seem rather distant. And yet, concerns with proper piety, defining what is and is not properly Ibadi, and with how such piety might evoke the Imamate, remain significant. Eickelman's analyses about Imamate thought and politics, individuals and relationships, thus resonated not only in the 1980s and 1990s when living memory about its formation and politics easily circulated, but also for younger generations of Omanis who years later have accessed those times primarily through various texts and textual traditions and have been shaped in part by the processes of state education.

Whether among Imamate scholars and judges, in the Quranic schools of Hamra that were fast changing, or when considering what oil means, Eick-elman recognized that ethnographic fieldwork required a commitment and care to both the details of everyday life as well as to history. Drawing from local letters, from Bayt al-Mal account books, interviews, and various published histories that had only begun to be circulated even within Oman, Eickelman's work was revolutionary in its attention to the practices of the scholarly world of Islamic learning, its transformations, and its legacies.

** 10. The Unbearable Lightness of Being Turkish

Jenny White

In a seminal essay, “The Art of Memory: Islamic Education and its Social Reproduction,” Dale Eickelman (1995) suggested that Islamic knowledge has two main aspects. One emphasizes fixity and memory, though also allowing for flexibility and variation, and requires discipline and communal obedience. The other emphasizes Islamic knowledge as a cognitive style that accommodates a popular understanding of Islam, often communicated through music and oral poetry, as well as by means of crafts and commerce. The Turkish experience of Islam in the twentieth century, I suggest, has been skewed towards the second aspect by the Republican destruction of Islamic learning and the institutions that taught and disseminated it and by other Republican reforms, like language reform.

During the Ottoman era, the ^eulama, men of religious learning, measured new forms of worship and pious practices against an assumed authoritative standard based on exegesis of the Qur’an and hadith and centuries of accreted juridical decisions. Without this steady background drumbeat of Islamic learning, piety and Muslim practice became principally alloys of other forces acting upon the population, such as media and market. As a result, since the founding of the republic, the state and different elements of the population have vied for authority over correct religious practice. Education, urbanization, globalization and the market all have played important roles in introducing and naturalizing new configurations of the national and Muslim self as lifestyle forms, with related consumption practices. In particular, the 1990s saw the rise of Islamic practice as a form of self-expression and marker of upward mobility and political identity.

The process of stylistic invention was given free rein by the law in 1929 that changed Arabic-based Ottoman to a reconstructed Turkish language in the Latin alphabet (Lewis 2002). This dramatically cut the Turkish Republic’s ties to its pre-Republican history by making documents in Ottoman unreadable to the next generation and making the educated elites of the time overnight illiterate. The scholarly literature has in recent years challenged the de novo exceptionalism propagated by the new republic, instead presenting compelling evidence of continuity between the Ottoman and Republican periods in personnel, political and economic structures, and culture as identities,

networks and hierarchies were absorbed into the nation’s new institutions (Meeker 2002).

Nevertheless, one can argue that certain reforms, like the transformation of the language itself and the wholesale reinvention of national history that posited that the Turks were direct ancestors of the Sumerians (2900 bc) and the Hittites (1600 bc) and that ignored five centuries of Ottoman Empire, of necessity created unprecedented linguistic, literary, architectural, and aesthetic breaks with the Ottoman past (Bozdogan 2002; Kasaba 1997; Tanyeri-Erdemir 2006; White 2012). The race to imagine Turkey led to innovations in all arenas of public life (Anderson 1991). The state propagated its social models through institutions, rituals, and schools, though attempts to penetrate all sectors of the population were thwarted initially by lack of communication and roads. Isolation allowed local cultural and religious variations to thrive in a largely rural, agricultural land (Kasaba 2009). It wasn’t until the 1940s that peasants could hop a bus to the city. Ever more moved there to work in the state-subsidized industries in the urban margins, until today more than three-fourths of

Turkey’s population live in cities (White 2010). Rather than adapt to Republican reforms, though, particularly those affecting lifestyle and religiosity, urban migrants developed their own urban subculture that discomfited the settled urban population by its perceived distance from and “pollution” of “civilized” modernity (Oncu 2002). Benedict Anderson’s “imagined community” of the nation state was challenged by other imagined communities that took some elements of early Republican invented traditions, like the Latin alphabet and nationalist history, but rejected or repurposed others, like dress, lifestyle, and religion. The language reform had effectively uprooted the Republican elites, while having little effect on the previously largely illiterate folk who brought their lifestyles and beliefs to the cities. Their religiosity had been shaped by the religious culture in their communities of origin, including a variety of Sufi orders.

*** 1. Islam as Bureaucracy and Embodied Practice

Shortly after the founding of the Republic, Islamic knowledge and practice underwent a seismic transformation. The ultimate, authoritative position of caliph as leader of the Muslim community was abolished on 3 March 1924 and Islamic lodges, brotherhoods and other religious establishments were declared illegal, though they continued to function clandestinely. Education was taken out of the hands of a patchwork of Muslim preachers and scholars and was unified under secular state control with a standardized curriculum. The Islamic calendar was replaced in 1926 by the Western Gregorian calendar and the day of rest was moved from Muslim Friday to Christian Sunday. The definition of the legitimate Republican Muslim self was defined by the state. The properties and wealth of Ottoman Islamic foundations and their educational facilities were absorbed into a Republican state-run Directorate of Religious Affairs (Diyanet), founded in 1924 and staffed by civil servants. The Diyanet trains and oversees religious specialists, supervises mosques, controls religious education in schools, interprets religious texts in a non-binding way, and writes sermons for Turkey’s 90,000 mosques. It was designed to implement laiklik (laicism, though often translated as secularism), the guiding principle laid down in the constitution that mandates state control over religion and aims to keep Islam out of the public sphere. Expressions of Islamic faith were expected to remain in the private realm. The state displayed little interest in officially regulating private life beyond its public attempts at social engineering through education and elite modeling of European habits of bodily comportment, conjugal relations, dress and secularity in lifestyle.

Without the institutions and financial wherewithal to engage in teaching and learning about Islam, ^eulama became extinct, turbans and other insignia of their calling were forbidden in public, and knowledge of them and their work was erased from public memory. All that remained was the physical memory of Islamic practice, much like a skill learned once from a master, and then handed down to apprentices who give it their own colorful twists. Even physical memory became attenuated as many secular urban elites were not taught the motions of prayer. The embodiment of a Muslim identity took on a polarizing social-class aspect. The conservative rural population and workingclass urbanites acted out and marked time by the rituals of Muslim prayer, while elite urbanites lived secular lifestyles managed by the clock, which became a symbol of the national revolution in

Western lifestyle, as brilliantly described in the contemporary satirical novel by Ahmet Hamdi Tanpinar, The Time Regulation Institute. Remarkably for a country in which being “on time” remains a negotiable value, in 2013, the mayor of Ankara, Turkey’s capital, allocated 14.5 million dollars to build fifty-two clock towers, with the aim of making it the city with the most clock towers in the world (Boyacioglu 2014). By the late 1920s, Islam had become embodied in a different way, as an element of blood or lineage. This has only recently changed as a result of market forces and a new Muslim nationalism of the twenty-first century that is reviving Sunni identity and a pious lifestyle as markers of Turkishness, albeit in highly original forms (White 2012: 163-80).

Turkey is home to a diversity of Sufi or Sufi-inspired Islamic orders and brotherhoods that survived the state’s ban on their activities in the early republic (Yukleyen 2008). Operating underground, out of view of the state, these orders kept traditions embodied in rituals, such as zikir, the intense, rhythmic movement of body and breath in communal prayer. Others have “moved away from personal spirituality towards a more institutionalized social or political project” (Yukleyen 2008: 381). Silverstein pointed out that being broadcast on mass media has altered practices that embody Sufi communal identity through what he called “disciplines of presence” (Silverstein 2008: 141). This has transformed them into generalized “Islamic content” without an embodied component or the building of communal identity, and listeners may be entirely unaware of a Sufi connection. In the new republic, in other words, Islam was uprooted and transplanted into the sterile soil of state bureaucracy, popular media, and the market, but paradoxically has become more intimate through its infusion of the everyday with free-floating physical, aural and visual stimuli.

*** 2. Islam as Race

Turkish nationalism as the unifying ideology of the new Republic was built on several overlapping sets of premises, ranging from language and culture to ethnicity and race, each permutation having singular effects on who would be defined as a citizen and a Turk. Islam played a complex role in this, as a culturally distinct Turkish Islam and as an ethno-racial identity. The sociologist Ziya Gokalp (1959) provided the intellectual basis for the role of Islam in republican society. Influenced by Emile Durkheim, Gokalp believed that in order to survive as a nation, Turkey required a unitary national culture with a common language, religion, set of customs and morality. He suggested that this unity could be built through education, rather than based on race or ethnicity. These ideas were incorporated into a powerful nationalist ideology. Nevertheless, many non-Muslims in the early Republic believed that they could assimilate by speaking Turkish and adopting the cultural habits of the Republic. Jews in the early Republic began a “Speak Turkish” campaign to do just that. Gokalp defined Muslim customs and ethos as essentially Turkish, retaining elements of pre-Islamic Central Asian shamanistic tradition that he believed expressed democratic, gender-egalitarian and modern beliefs and that reflected the tolerance characterizing the Turkish Sufi tradition. Gokalp thus proposed a superior Turkish Islam purified of corrupting Arab influences from the Ottoman era. The notion of a superior Turkish Islam survives in public discourse to this day, despite the current Justice and Development Party (akp) government’s political outreach to fellow Sunni Muslims in the Arab world.

Soon after Gokalp’s death, European racial ideas pushed aside the notion of Islam as culture in favor of a religio-racial definition of Turkishness as Muslim. Only Muslims could be Turks, and this was expressed in the language of blood and national lineage (soy) (Eissenstat 2004). This allowed secular Turks to downplay their faith while claiming Muslim (Turkish) identity and to deny Turkish identity to non-Muslim citizens. Public discourse, the press, and schoolbooks commonly identified Turkey’s “internal enemies” as its nonMuslim citizens who appeared to be part of Turkish society, but whose loyalty lay with their co-religionists abroad who were trying to undermine the Turkish nation. As non-Muslims, they could be citizens, but not Turks.

*** 3. Public Muslims

Eickelman and Anderson (1999) observed that from such interactions among authorities and political leaders and their constituents, a new Muslim public sphere emerged. Muslims whose identities had been embedded in their family, neighborhood and community became caught up in Muslim identity politics at a national level, amplified by new media that packaged Muslim content in new forms. After the introduction of multi-party political contests in 1946, Sufi orders began to play a more public role as their shaykhs or leaders competed for political influence by pledging the votes of their followers. At present, different orders occupy the political firmament around the powerful office of president, where they compete for power and positions in state institutions. One such order, the Hizmet (Service) movement organized around the preacher Fethullah Gulen, worked closely with the present government for many years before falling out in 2013. The government closed Hizmet schools, cutting off an important financial resource for the movement, and prosecutors and police believed to be linked to Hizmet carried out a criminal investigation of high-level government officials on corruption charges. The akp government retaliated by declaring Hizmet to be a terror organization with the acronym feto and blaming it for the failed coup attempt in 2016 (White 2008: 377-78).

Eickelman (1995) points out that in Algeria and Egypt, as Islamic education was absorbed by the state and teachers became civil servants, the prestige and authority of Islamic education was undermined in favor of alternative education. Unlike Algeria and Egypt, Turkey does not have trained Islamic jurists or a nationally distinct brand of Islamic theology. Many of Turkey’s theologians have been educated in Western philosophy and are as likely to cite Paul Feyerabend as the Qur’an. Rather than organizing as a Sufi brotherhood and engaging in traditional rituals, Hizmet instead incorporated itself as a series of seemingly unconnected foundations that engaged in business and education, running hundreds of well-regarded schools in dozens of countries. The movement retained some aspects of Islamic learning as described by Eickelman, particularly lesson circles, peer learning, and the custom of social and economic sponsorship by established men in the order (Eickelman 1995). However, in Hizmet reading circles, the followers did not study the Qur’an, but rather the writings of Fethullah Gulen. Worship was embodied in service to the movement through educational activity and in regular communal meetings of local business networks, thereby cementing

what has come to be the leitmotif of Turkish Islamism, a fusion of piety and profit. Hizmet graduates populated the ranks of state institutions like the judiciary, police, education, security services and the military. Eickelman (1995) makes the interesting observation that in Morocco alternative education allowed the development of a secondary elite, “those who allow the rulers to rule” and whose networks exist to this day. In Turkey, the ruling party in 2015 accused Hizmet networks of creating a state within the state and declared it to be a terrorist organization, detaining and/ or firing over a hundred thousand citizens, primarily professionals, teachers, students and civil servants, on suspicion of being members.

Under the current regime, Diyanet has expanded its role beyond purveyor of state-sponsored Islam to become an arm of the state with deep reach into society and the private sphere. Diyanet’s budget grew at least fourfold since 2006 and it now employs 117,000 people, many of them women preachers (vaizel-er), whose mandate now includes delivery of social services like psychological counseling to the population, services that had previously been the purview of secular institutions (Economist 2018; Maritato 2015). For the first time, a state institution is able to penetrate into the most intimate spheres of people’s private lives, including the bedroom, through such services as sexual counseling. Islamic broadcasters have proliferated in recent years. They too have moved away from theological programming that focused on doctrine, scripture and ritual to embrace an explicit role in “assisting the state in fighting social problems” through family-friendly programs. Among other things, these programs impress upon the viewers their responsibility to take care of family members, in effect to provide social services in place of the government (Kocamaner 2017).

*** 4. Islamicized Politics

Islamist politics implies a coherent political program to incorporate Islam into political practice. I would argue instead that the akp regime has Islam-icized politics. That is, it has instrumentalized Islam as a means to gain and retain power by harnessing the discourse and imagery of a free-floating and thus malleable Islamic sensibility to the state’s economic, political and foreign policy projects. Just as the state has become intimately involved in people’s lives through institutionalized Islam and the media, newly devised state rituals perform Islam as a constituent element of a newly Islamicized Turkish national identity. Schools celebrate the Prophet’s birthday, while municipalities host elaborate public re-enactments of the 1453 conquest of Byzantium by the Turks, explicitly staged as the victory of Islam over infidels. In many cases, religiously colored rituals have replaced prior secular national rituals.

In the 1980s, Turkey moved from being a closed, state-led economy to being a globalized liberal one that allowed small provincial entrepreneurs to expand their businesses and amass wealth. This business class tended to be more pious and conservative than the state-subsidized industrialists who until then had made up the business elite. The new conservative elites put their support behind a series of openly Islamist political parties. The

current ruling Justice and Development Party (akp) is an offspring of these earlier parties. While still touting the superiority of Turkish Islam, these parties were nonetheless more open to a definition of Turkishness based not on Turkish racial purity, but on a redefinition of Turks as former Ottoman rulers of other Sunni populations in the region. This required a rewriting of national history, a rejection of ethno-racial boundaries defined by one's Turkish Muslim soy or lineage and a repatriation of the Ottoman Empire as Turkey's roots. Since a renewal of such a "special relationship" was not necessarily welcomed by the countries in the region that remembered their Ottoman overlords less than kindly, Turkey played up its identity as a fellow Sunni Muslim country. Turkey expanded its role in the region both economically and politically until the Arab uprisings of 2011 largely derailed its interests. The idea that Turks and Arabs (and Southeast Asians) share an identity as fellow Sunni Muslims undercuts the ethno-racial definition of Turks as Muslims by blood, and Turkish claims about the superiority of Turkish Islam. More importantly, this broader identification allowed Turks to expand politically and economically beyond the boundaries of the republic, though expectations of the Sunni Muslim world have failed to materialize.

*** 5. Cosmopolitanism, Commercialism and the Islamic Individual

The interaction with the outside world as "fellow Muslims" went both ways. It also allowed outside commercial and political interests, as well as cultural and ideological influences, to penetrate the previously inward-facing Turkish national realm. The introduction of transnational Islamic influences began in the 1970s with the translation of Islamic modernist thinkers, such as Hassan Al Banna, into Turkish (Kramer 2010; White 2005). Their ideas helped develop a set of fundamentally anti-Western, but pro-Turkish and pro-business ideas that the political leader Necmettin Erbakan set out in his party platform in 1972 as Milli Goru§ or National View (White 2008: 362, 366; White 2014). These views were moderated by the Justice and Development Party when it was first elected in 2002. At the time, the party claimed to have rejected the National View and that they were not Islamists, but rather pious Muslims running a secular government. This was a model of Islamic personhood that posited that piety was a personal characteristic that a pious Muslim took with him or her into elected office, but did not affect policy making.

Indeed, the early years of akp were marked by highly pragmatic, proWestern economic and foreign policies and outreach to non-Muslims and other minorities within Turkey. As Turkey's society globalized through travel, media and marketing, and as, for the first time in republican history, the pious population became upwardly mobile, Muslim identities increasingly became embedded in newly available market products. Aspects of Muslim practice, like veiling, became lifestyle choices and forms of individual expression. Young pious Turkish Muslims spoke to me about their choices in veiling styles and other Muslim comportment and practice as something that was important because freely chosen. They practiced §uurlu Islam, conscious Islam (White 2012: 164). Personal choice and self-expression, they explained, made their Muslim identity modern, unlike that of other women who veiled because of tradition. Companies selling wholly invented "traditions" of Muslim clothing echoed these aspirations in their advertisements. Selling their inventions as

reflecting Ottoman palace chic (Navaro-Yashin 2002), the businesses played on their pious customers' social class aspirations.

Having grown up during this decade of expansive globalization, commercialization, and identity experimentation, some pious young people developed cosmopolitan desires that echoed their experiences in other places in the world that were exposed to the same forces (Saktanber 2002). Piety sometimes took the form of "looking for meaning" and joining civic organizations that worked for social justice causes, rather than joining a brotherhood or mosque engaged in zikir and prayer (White 2012: 163-80).

While national rituals have become Islamicized, other performative references to politics and Islam have become personalized (and commercialized). Esra Ozyurek (2004) writes about how the worship of Turkey's secular founding father, Ataturk, has moved from the public sphere to homes, where small shrines of purchased symbolic objects are set up that allow people to imagine a personal relationship with what is really a political idea (Ozyurek 2004).

Likewise, the day a young woman covers her head for the first time, once an unremarked step in her lifecycle, has been transformed by market and media forces into a new kind of celebration, a communal party akin to an American wedding or baby shower, complete with gifts.

*** 6. Who Is a Good Muslim?

All of the forces described above have torn at the social fabric that defines what it means to be a good Muslim in Turkey. Outside influences, ranging from Islamic ideologies to Islamic products, have allowed both a narrowing of Muslim self-definition and a further untethering of Islam from its historical or institutional roots. Over the past decade, Turkey has been embroiled in complicated political intrigues and conflicts throughout the Middle East. The government's engagement with armed radical Islamist groups in places like Syria and their members' transit through and residence in Turkey has meant that hardline Islamist views, like Salafism, and al-Qaeda and isis-linked ideologies that had previously found little foothold in Turkish society and institutions, have been imported from abroad. They have found some resonance in scattered local environments and in political groups with Turkey-specific agendas, like Huda-Par, a radical Islamist political group active in Kurdish areas of eastern Turkey. Government discourse has echoed some of their extremist views, granting them public legitimacy and reviving the anti-Western sentiments of National View, the Islamist platform that initially had been disavowed by the akp. The hardening of Islamist views within Turkish institutions can be seen in a conservative bent in Diyanet pronouncements on social issues, as well as in its introduction of concepts like martyrdom as a religious duty, which was incorporated in a children's magazine published by Diyanet. Previously, the term martyr (§ehit) had been used by the Turkish state exclusively to refer to soldiers who had died in battle in service to their country. In the magazine, a father explains to his young

son and daughter that they should aspire to die as martyrs. While still associated with nationalism and dying as a soldier, martyrdom is justified in religious terms and recommended also to the girl, his daughter (Diyanet Qocuk 2016; Koger 2016). Hart (2009) writes about recent homogenization of religious beliefs and practices as villagers try to curry favor with the state by being what they think the state considers to be good Muslims. Government discourse about the Islamic prohibition of interest has filtered to the general population and created a demand for Islamic banks and other financial instruments presented as Islamic. The author was informed recently that pious Turks have begun buying “Islamic” insurance policies from Malaysia, causing Turkish banks to try to tap into that market as well. In this way, the transformation of Muslim identity and Islamic practice and beliefs in Turkey’s public and private sectors is being driven not by any theological understanding of issues like martyrdom or the prohibition of interest, but rather by an amalgam of political expediency, globalization, and an adaptive market.

*** Conclusion

The definition of Muslim has gone through a number of transformations since the founding of the Turkish Republic: Laicist occlusion and state control, ethno-racial identity, membership in brotherhoods harnessed to the political system, civil association activism, political branding, and entrepreneurship to meet the commercial demand for a “properly Islamic” lifestyle. In Milan Kun-dera’s (1999) novel, The Unbearable Lightness of Being, his characters struggle to find meaning in an environment where even the biggest emotions like love seem uprooted and dependent on coincidences and are, thus, fleeting and terrifyingly unsatisfying. Turkey’s artificially uprooted institutions and haphazardly formulated national identit(ies) make it particularly difficult for its protagonists to set out on any meaningful journey with an end in sight, be it modernity, Muslimhood or Turkishness itself. Even the meaning of being Muslim is buffeted by forces that have at times carved out distinctive Muslim cognitive styles and disembodied lifestyles, premised most recently on choice and marketed as brands of Islam - upwardly mobile, state-approved, racially or politically defined. Lacking Islamic knowledge that is rooted in a fixed, disciplined tradition, Muslims in Turkey, like Kundera’s characters, are forever looking for meaning and satisfaction in the awkward, competitive interplay between state definitions and popular understandings of what it means to be Muslim.

** 11. The Radicalization of Islam in Germany

Gilles Kepel

I met Professor Dale Eickelman on the board of a Social Science Research Council (SSRC) committee in New York in 1986. Thanks to that opportunity, I was introduced as a very young foreign scholar to American academe at its very best. Dale played a key role in bringing me in, since his perfect knowledge of French (or Moroccan French) had enabled him to spot my first book in its original language. When it came out in English translation as The Prophet and the Pharaoh, Dale used to make fun of the way I was depicted to the reader on the book jacket as “a young French academic.” He facetiously gave me the nickname “Jeune Gilles,” which he has used ever since, wondering whether I would ever be called an “aging scholar.” Well, three decades later those days have come, though I secretly believe that both of us have remained forever young.

While we sat together on the SSRC committee dedicated to the comparative study of Muslim societies, I had embarked on fieldwork for my second book, on the birth of Islam in France - Les banlieues de I’Islam: naissance d’une religion en France - published in 1987. My US colleagues were curious that such a strange topic would be a matter for study. Yet, thirty years later, many volumes have been dedicated to European Islam, all the more so after the wave of terrorism that we experienced from 2015 to 2017, starting with the Charlie Hebdo massacre in January 2015. I myself contributed to this series of publications with Terror in France: The Rise of Jihad in the West (published in French in 2015) and a sequel entitled La Fracture the following year. That book was translated into German, and I wrote a preface to it that I now have the pleasure to present in English translation on the occasion of Dale’s Festschrift. The chapter is a modest token through which “le Vieux Gilles” expresses his deep appreciation for the (rare) scholarly friendship that has endured between us since the 1980s, not to mention Dale’s invaluable guidance on the harsh path of latter-day Orientalism.

*** 1. French and German Jihadism in Contrast

On 19 December 2016, a black truck driven by the Tunisian national Anis Amri pushed hastily through the Breitscheidplatz Christmas market in Berlin. There

were twelve dead and more than fifty injured, and the operation was claimed by Islamic State. On 14 July 2016, in Nice, another truck, white this time, also driven by a Tunisian, Mohamed Lahouaiej-Bouhlel, had raced into the crowd celebrating the French Bastille Day, killing eighty-six people. The “ramming operation” was claimed in the same terms that would be used in Berlin by Amaq, Islamic State’s news agency.

The contrasting colors of the two trucks, black in Berlin and white in Nice, were chosen to imprint onto the memories of and amplify the shock in German and French civil societies. They recall the visual charter of Islamic State, whose banner, descending in white on black, is inscribed with the dual confessional of the Muslim faith: “There is no God but God, and Muhammad is His Messenger” - the logo of contemporary jihadism.

In each case, the “mass attack” operation, as defined in the language of Islamic State, aimed simultaneously at two objectives. First, a strong spiritual symbol - the Christian holiday of Christmas, and, six months before, the secular, republican festival commemorating the taking of the Bastille. They are emblematic of Christianity as well as of the Enlightenment, both plainly loathed by Islamic State, which thereby expresses metaphorically its desire to annihilate them, in the same way that it ransacked or leveled churches, museums, and mausoleums in the territory under its control, from Mosul to Palmyra. Second, European societies are at the same time struck in their flesh and blood, touched in their daily life during holiday shopping or at a summer vacation spot, so as to target the consumerism and hedonism that is despised within the doctrinaire Salafism that inspires the jihadist worldview.

The continuum between the two cardinal attacks on Germany and France also links the two pivotal states of Europe in the common destiny of confronting terrorism. They are the “soft underbelly of the West” that third-generation jihadists have made their favorite enemy, in line with The Call to Global Islamic Resistance, a 1600-page book that Syrian engineer Abu Mus'ab al-Suri posted online in 2005 (see Kepel 2015: 24). Al-Suri was educated in France, became a naturalized Spanish citizen, and was a longtime resident of “Londonistan,” that British haven of Islamists from around the globe at the turn of the century.

Yet, until the Berlin bombing at the 2016 Christmas market, a good part of the German political class and commentariat, while showing deep empathy and unfailing solidarity with each of the Paris attacks, remained persuaded that Islamist terrorism in Europe was primarily - if not mainly - a French problem. France has tallied by far the largest number of casualties from jihadist attacks in Europe. From the carnage of January 2015 at the headquarters of Charlie Hebdo and the Hyper Cacher supermarket in the Porte de Vincennes section of Paris, to the assassination of Father Jacques Hamel in his Normandy church on 26 July 2016 to the 130 victims of 13 November 2015, jihadist attacks have claimed 239

deaths. France’s particular social and economic context seemed to provide the reason for a French exception, which, because of that nation’s intrinsic flaws, had motivated jihadist revenge. The elements in question include an extremely high unemployment rate in the working-class suburbs, which the children of immigrants from Arab North Africa populate; France’s colonial history, concluded just 55 years before in the violence of the Algerian war of independence; and, its republican laicite, which many people east of the Rhine judge to be excessive. There was a thought that Germany would be better protected because of its history being immune from a colonial past, a more inclusive social model, and an accommodating approach to religion in a society traditionally balanced between Protestants and Catholics.

The existence in Germany of a more favorable industrial labor market for Turkish immigrants and their descendants[119] seemed to inhibit the shift towards social deviance or even violence among young people of immigrant origin. Meanwhile, in France, unemployment, which encompasses up to 40 percent of the youth in working-class, mostly immigrant, and frequently Muslim neighborhoods, fuels disaffection from society. Moreover, Turkish Islam, solidly managed by disciplined parties closely linked to an authoritarian political system in their country of origin, seemed mainly oriented towards that system and distanced from international jihadism, which was first expressed in Arabic - the language of culture and reference for North African immigrants in France, who constitute the majority of immigrants in that country. In addition, in relation to the immigrant populations of Germany, the absence of a German colonial past in the territory of the German mainland European empire helped to avoid overloading the collective memory with frustrations, wounds, and a spirit of vengeance. This is unlike the French situation, where a return of the repressed retro-colonial complicates adherence to a nation accused of crimes against one’s parents’ generation and one’s country of origin. Finally, the recognition of religious denominations as an integral part of civil society and their financing by taxation seemed to make for a more comfortable space for Islam in Germany than the strict separation of church and state in France. France’s “full secularism” is readily stigmatized east of the Rhine by the multiculturalists who are widespread on the German left and among the Greens, who carry much more political weight than they do in France.

*** 2. Jihadism in Germany

This view that contrasts France and Germany and highlights the social, historical and cultural differences between the two countries has been challenged by the similarities between the 2016 attacks on German and French territories and the strong parallels between the Nice and Berlin massacres. The latter had been preceded, as in France, by individual stabbings or explosive attacks. On 18 and 24 July in Wurzburg and Ansbach, Bavaria, an Afghan asylum seeker and a Syrian refugee took violent action, and Islamic State followed with claims of responsibility formulated in the same terms as the killings in France. Those attacks preceded the 10 October arrest of another Syrian refugee who had been planning an attack on Berlin airport and was later found to have committed suicide in his cell. Then, on 30 October, Islamic State’s Amaq News Agency claimed responsibility for the murder of a teenager

stabbed in Hamburg, again “in response to calls to target citizens of the countries of the Crusader coalition who are bombing the territory of the Caliphate.”

In November, a large sweep was launched against the Salafist True Religion association, which was banned for purportedly organizing the departure of 140 people to Islamic State-controlled areas in Syria and Iraq, in addition to the approximately 900 Germans who had already joined the combat zone. That figure made Germans the second largest European contingent of foreign Islamic State fighters after the 1,300 French and before the 600 Belgians. Founded in 2005, the True Religion association attracted attention in 2011 when, under the leadership of Ibrahim Abou-Nagie, a preacher from Gaza and an electrical engineer who had been trained in Germany, it started to distribute copies of the Qur’an in the streets. One might think that this strategy, known as “street-da'wa ” (calling others to Islam in the streets), was intended to provoke the German authorities into reacting in a way that would create a sense of victimhood among Muslims. It was taken a step further in September 2014, when another Salafist group began to patrol the streets of Wuppertal, in the state of North Rhine-Westphalia, dressed in orange vests marked “shari'a police.” They would instruct Muslims not to drink alcohol, gamble, or listen to music, and enjoin Muslim women to wear the veil, in areas identified as shari'a-controlled. In a 2016 ruling by the Wuppertal Landgericht court, the seven participants in the patrol were charged, but out of respect for freedom of opinion, not convicted. The leaders of the movement, fireman Sven Lau and boxer Pierre Vogel, who had converted to Islam in 1998 and 2001 respectively, and had become active and charismatic Salafist preachers, were not implicated. Lau was already facing a more serious sentence in another trial. Since September 2016, he has had multiple appearances before the courts over an appeal against his conviction for supporting the jihad in Syria in connection with the Jaysh al-Muhajirin wal-Ansar militia, which was linked to Islamic State.

Also in November 2016, a member of the Federal Office for the Protection of the Constitution and a convert to Islam was arrested on suspicion of planning jihadist attacks in Germany. In addition, on 8 November, the Hildesheim-based Iraqi preacher Abu Walaa, who distributed so many videos that he was considered to be “Islamic State’s number one [man] in Germany,” was arrested. The initial investigation after the Berlin bombing indicated that Anis Amri, the driver of the black truck on Breitscheidplatz, had been in contact with him. This Tunisian national, who had no affiliation to Islamist circles in his country, had left Tunisia at the age of eighteen, taking advantage of the Jasmine Revolution to try his luck in Italy. He lived a reclusive life on Lampedusa and, after attempting to set fire to a school, was incarcerated in Italy. It was while he was in prison there that he came into contact with jihadist circles and turned from being a petty offender into a potential terrorist. This phenomenon was also commonplace in France; most of the activists who committed the main attacks of 2015 and 2016 had been trained in prison. In 2015, as a refugee in Germany after his release from prison, Amri was placed under surveillance because of his association with Abu Walaa. He swore his oath of allegiance to the caliph of Islamic State, Abu Bakr al-Baghdadi no later than the fall of 2016, a month or two before the attack. That can be inferred from the golden foliage on the trees and the warm blue-black parka he was wearing in the video, which was broadcast shortly after 19 December by Islamic State to support his claim. It was filmed on a bridge near the former river port of Nordhafen, in Berlin-Moabit, in

the borough of Mitte in an ultramodern section of the city built after reunification to embody the new Germany and not far from the Federal Ministry of the Interior. The challenge to the German security system seemed deliberate in the choice of this location, though the telephone surveillance of Amri had been lifted for lack of convincing evidence against him. Similarly, the French security services had lifted the supervision of the Kouachi brothers and Coulibaly on the same grounds a few months before the Charlie Hebdo attacks.

Berlin-Moabit is also home to the Fussilet 33 mosque, which Amri and other Islamists suspected of being Islamic State supporters frequented; three people were arrested there on 1 February 2017 for planning to travel to Syria or Iraq. It is also less than fifteen minutes from where the black truck was stolen. Amri swore his allegiance to the caliph in the same manner as the French assailants of 2016 had done, notably Adel Kermiche, who had murdered Father Jacques Hamel in Rouen on 26 July. He expressed himself in fluent Arabic, which he had learned in high school in his native Tunisia. His ritual text of allegiance to

Islamic State is augmented by his own commentaries on the punishments to be reserved for the crusader pigs (al-khanazir al-salibiyyin) in this world and in the afterlife - especially Europeans, among whom he was situated at the moment when he was recording his text - as well as a litany of hadith s or statements attributed to the Prophet and intended to reinforce his reasoning.[120] Amri in no way has the look of a bearded jihadist dressed in the traditional Salafist jallaba, but the appearance of a young man connected to this great multicultural city that is the German capital. As he speaks, Amri can be seen with the white threads of two earphones hanging from his ears, which stand out against his dark parka. The look testifies that he is a member of “Generation Y,” of those “digital natives” who constantly mix the real and virtual worlds, as if he were reciting a text that would be dictated to him from Mosul or Raqqa via the Telegram messaging app or another of Islamic State’s favored media. Similarly, most of the attacks that took place in France in 2016 were “remotely controlled” from the territory of the “caliphate” by telephone, via the Internet, or on social networks at the instigation of a French jihadist based there.

*** 3. The Denial of the Jihadist Phenomenon in Europe

In truth, the year 2016 in Germany brought to a climax phenomena which had already for several years been presenting a number of worrying signs, but which had been neglected within the political and media consensus. The makers of that consensus have experienced conceptual difficulties in addressing the challenges posed by the emergence of political Islam in the West and its transition to jihadist violence. The black truck at Breitscheidplatz has made these problems glaringly obvious, and concealing them is no longer possible. This is a dilemma that France had already experienced. There are two alternatives: either political leaders, the press, and academics can remain in denial about jihadism, about its relationship with Salafism and other forms of Islamism and, as a consequence, public opinion, which takes note of the violence and is legitimately concerned, will no longer trust those leaders and will be seduced by the simplistic explanations of the far right, leading to a

division of society along cultural and racial lines. Or, we can tackle the problem head-on by analyzing social facts and their cultural-religious expression in a dispassionate way, even if that means questioning various reassuring certainties inherited from our recent history that have proven false and are now out of step with the challenges of European societies.

In France, two factors have contributed towards blurring the phenomenon. On the one hand, half a century after Algerian independence there has been a return to the discourse of colonial repression, which has brought a retrospective lawsuit against French society for its guilt as the heir to colonialism. On 19 March 2012, Mohammed Merah killed a group of Jewish students of the Ozar Hatorah school in Toulouse and their teacher in a highly symbolic manner. This first act of contemporary jihad in France took place exactly fifty years to the day after the implementation of the ceasefire at the conclusion of the Algerian war of independence. Merah, henceforth in the name of jihadism, reinitiated the war on the territory of the former colonial metropolis. This framework of thought provided that child of a family of Algerian immigrants who hated France with an historical justification for violence, feeding it as a memorializing fuel. At the same time, in order to broaden his message beyond the ranks of the jihadists, he strove to capture the mixture of anti-Zionism and Judeo-phobia that is very present in the contemporary Arab political imagination. He thus sought to justify the barbarism and instinctive repugnance provoked by the massacre of small children, by weighing it against the “massacres of Palestinian children” that are routinely attributed to the Israeli army, according to a kind of lex talionis that would allow one to refrain from any other moral norm.

On the other hand, the vanishing of the proletariat as a messianic class carrying the redemption of a suffering humanity, at a time when the postindustrial era has reduced the working class to a shrunken husk and where the majority of French workers, threatened by the relocation of industrial jobs, now vote for the far-right identity party, the National Front, led a whole movement of far-left orphans of such proletarians to substitute Muslims in that redemptive function. The latter are constructed as an abstract and unambiguous category that ignores the social, cultural, political and even religious differentiations within them - as in any human community - and confuses them with the Islamist expression of a minority. In that confusion, the slogans of Salafists, Muslim Brotherhood groups and jihadists are mixed together, and adorned with an authenticity that is all the greater because they denounce the West. The “Crusader pigs” anathematized by Anis Amri in his video claiming responsibility for the attack of 19 December 2016 echo the “agents of imperialism and capitalism” of yesteryear. However, the new vocabulary used reflects a transformed vision of the world in which cultural-religious divisions have replaced class struggle and are shaping the closed identities around which the fractures of our societies are structured.

These complex mutations have facilitated a form of voluntary blindness in the face of the jihadist phenomenon. Without denying the monstrosity of certain acts, various observers have tended to relativize them, because they are, according to them, the emanation of a socio-cultural group characterized as oppressed - by imperialism and Zionism on an international scale, and by social marginalization and Islamophobia in the French context. The observers in question have thus failed to attend to a specific analysis of the

phenomenon, simply seeing here a contingent Islamization of radicality. It is to the category of radicality that they attribute a necessary, ontological, trans-historical character. That is the analysis of Olivier Roy, for example, for whom there is no difference in substance between the Italian Red Brigades or the Red Army Faction of yesteryear and ISIS today.[121] The intergenerational dynamics are similar in his view, since both types of groups express resentment against an adult society in which the youth cannot find its place. Translated yesterday into the vocabulary of Marxist-Leninism because it was the one available, their youthful aggression today borrows the Islamist lexicon because it is more widespread. It is simply a variation of color, from red to green, not any modification in the essence of the radicalism in question.

In Germany, this substitution of Muslims for the proletarians of yesteryear has found a comparable result at the summation of a different historical process. Indeed, if that country does not have to atone for a colonial empire, it bears the historical stigma of the Shoah, which could be transcended only by eradicating any potential discrimination against a religious minority group that might recall the persecution of the Jews. Moreover, it is the mutual renunciation of Nazism and colonialism[122] and the reciprocal purging of their memory by Germany and France, which in the two decades following World War ii formed the basis for the process of European integration. Each of those two great nations, in the person of their redeeming fathers (Adenauer and de Gaulle), absolved the other from a heavy past by projecting itself into a future that first by the Common Market, then the eec, and finally the EU, would aggregate into the European dynamic. At a time when Europe is being undermined from within by a poorly controlled enlargement, by Brexit, and by the simultaneous rise to power of Islamist Salafism and the far right, all against a backdrop of jihadist terrorism, the reluctance to implement a critical analytical distancing from Islamist ideology bears some connection to the guilt inherited from Nazism. Any assessment that moves away from abstract representations of Muslims as minorities and oppressed persons would testify a priori, here again, to an unacceptable Islamophobia that is comparable to anti-Semitism, which constitutes the abominable legacy of the Third Reich. France, confronted with the January 2015 attacks, also experienced this type of denunciation of Islamophobia, which was attributed to participants in the major protest march of 11 January. The writer Emmanuel Todd (2015) interpreted that denunciation as a remnant of traditional French anti-Semitism; behind the slogan “I am Charlie” he saw an incentive to “spit on the religion of the weak” - today Islam, yesterday Judaism (see also Kepel 2015: 181).

However, the denial of the jihadist phenomenon on European soil, and its concealment on the pretext that Islamophobia is a more significant social phenomenon, contributes, to use the language of psychoanalysis, to what Jacques Lacan calls “foreclosure,” following Sigmund Freud’s Verwerfung (repudiation). It is a defense mechanism that drives out of the psyche an event that is not only forgotten, but also perceived as never having existed. It is a mechanism that leads to delirium or denial. It would come out in the so-called “burkini” affair. This episode occurred in the summer of 2016 on French beaches, at the instigation of the Islamist movement, just after the Nice attack, and in the very place where the attack occurred, the seaside Promenade des Anglais. In the course of a few days, the affair transformed France from a victim of jihad with 239 deaths in a year and a half -

then suddenly foreclosed - into the republic of tormenting Muslim women in burkinis, the Gulag of Islam, with laicite in the role of Stalinism.

In addition, there exists a refusal to see that the community hostage-taking of our Muslim compatriots, in which they are trapped by the jihadist process of provocative attacks, is in fact the game of the extreme right. The attacks are designed to elicit violent reactions in the majority European population against Islam, its mosques and its followers, or, at the very least, to encourage a massive increase in votes in favor of an extreme right-wing identity. In France, February 2017 polls had been showing that the National Front's candidate for the April-May presidential election had been in the lead in the first round for more than a year, and might be a possible winner in the second round (which Emmanuel Macron actually won against Marine Le Pen). Among the party's themes, the rejection of the "Islamization of France," the reversal of migratory flows (or remigration) and the denunciation of the "Great Replacement" of populations of European origin by children of Muslim immigration remained the most popular. In Germany, the Alternative for Germany Party (AfD), founded in 2013, began to achieve significant electoral successes in September 2016. Winning 21.4 percent of the votes in Mecklenburg-Pomerania, Chancellor Angela Merkel's stronghold, it overtook the Christian Democratic Union (cdu) there. It then achieved good results in the Berlin Landtag, which became the tenth state assembly to include elected party representatives, despite Berlin being the symbol of German cosmopolitanism. In January 2017, a senior AfD leader, though he was partially disavowed later, pleaded for a revisionist attitude towards the official discourse on the Shoah and for a "180 degree change in Germany's politics of memory" towards the Nazi past.

The lifting of this type of taboo, the broader implications of which are beyond the thematic scope of this chapter, is grounded in existential anxieties fueled by a confusion between several simultaneous events, which belong to three different registers. There is, first, the controversial arrival in 2015 of more than one million refugees, mainly from Syria, Iraq and Afghanistan, by the chancellor's decision, summed up in the optimistic slogan "Wir schaffen das! (We can do this!)." Next, there were the 2015 New Year's Eve events in which more than a thousand women were sexually assaulted in Cologne and Hamburg by mostly North African asylum seekers and illegal residents, but whom elements of the press and public opinion confused with refugees.[123] Last, there was the rise of the jihadist phenomenon on German soil, which, as we have seen, culminated in 2016 in the Berlin bombing of 19 December.

As in France, although in a different social and historical context, the development of the jihadist threat in Germany is fueling the rise of the extreme right.

If civil society and the political class fail to proceed to a dispassionate analysis of the phenomenon and continue to take refuge in magical thinking, then it will lead to a fracturing of society on identitarian terms. Identity conflicts are unlike the class oppositions that the political system has normalized through civilized clashes between left and right in

parliament, thereby replacing street violence with oratorical combat in its precincts. Identity conflicts are not soluble within the traditional practice of politics as established by the democratic system, but instead lead to violence between reified ethno-religious and cultural entities for whom there is no possibility of compromise. In this sense, one must take seriously the wish to foment civil wars in Europe contained in Abu Mus'ab al-Suri's Call to Global Islamic Resistance, a process that for him begins with the establishment of autonomous territorial enclaves in ghettoized areas where the Islamist norm can be imposed in its Salafist and rigorous sense. This is the same logic that advocated that "shari'a police" should patrol the streets of Wuppertal in 2014. In al-Suri's model, a war of attrition precedes a generalized confrontation. It is not that the hypothesis is realistic as such in the short term, but it nonetheless feeds the political imagination of the European jihadists, and informs us about their modus operandi and worldview.

*** 4. Conclusion: Jihadism, European Politics, and the Rising Far Right

In this context of a jihadist threat, Germany confronts a structural change in the equilibrium between its global society on the one hand and its population of Muslim immigrants and converts to that religion on the other. The German Muslim community, estimated at 4.5 million at the end of 2015 (bamf n.d.), was traditionally dominated by Turks who in 2011 represented 67.5 percent of that population. They are now only 50.6 percent, while Muslims from the Middle East - mainly from the conflict zones of Syria and Iraq - form the second largest group at 17.1 percent of the total. In fact, 1.2 million Muslims, along with some illegal immigrants from North Africa, are officially registered as having entered Germany between 2011 and 2015. However, as we have seen, despite intense differences in orientation, Turkish associations are mainly in charge of the political management of Islam in Germany. Unlike those of the much more fragmented Arab Islam, these associations share the common characteristic of being quite strongly hierarchical and closely linked to parent organizations in the country of origin, thus promoting the emergence of clear interlocutors for the German authorities. The war in the Middle East and its consequences for Europe have brought some structural changes to this situation, and have introduced new constraints into Germany, which have uncertain implications.

First, Erdogan's Turkey, while busy consolidating its authoritarian power, of which repressing the summer 2016 coup attempt was a culminating point, engaged in a complex relationship of conflict and blackmail with the European Union, especially Germany. Tensions had arisen over the regulation of the flow of migrants from the Middle East, who were fleeing areas of conflict or deprivation and whom Ankara was allowing to penetrate EU territory, via the Greek islands or Thrace, with a view to reaching the labor markets of Germany. The 18 March 2016 agreement concluded at the German chancellor's initiative by Brussels with Ankara to finance the detention of refugees in Turkey undeniably reduced the demographic pressure on Europe. At the same time, it strengthened "Sultan Erdogan's" controversial influence and capacity to intervene, especially with respect to the Turkish populations in Germany. In this context, there has been an increasing polarization between opponents and supporters of the latter within the German Turkish diaspora, which is weakening security cooperation with Berlin. First, the ostracizing by German Turks linked to Mr. Erdogan's akp of

the followers of Fethullah Gulen, who was accused of instigating the July 2016 putsch, posed problems of public order. Second, Ankara’s change of course in 2016 regarding Bashar al-Assad’s Syrian regime opened up new security challenges with respect to Turkey’s ability to remain a reliable interlocutor for controlling its emigrant population in Germany. Indeed, the year 2016 saw a significant change in Ankara’s Syria policy. Prior to that year, Mr. Erdogan’s regime had supported the rebels, including the Islamists of the Nusra Front linked to Al-Qaeda, and had turned a blind eye to the activities of isis, keeping its southern border open for European jihadists to join the territory of the caliphate, and welcoming tankers carrying oil pumped from it. This change, which resulted in a rapprochement with Vladimir Putin, Bashar al-As-sad’s main supporter along with Shi'ite Iran, made the fight against Kurdish irredentism Turkey’s main priority. Mr. Erdogan began to promote a Turkish nationalist policy in response to the threat posed by the conjunction between the Syrian Kurds of the pyd, whom the United States had been heavily arming to fight isis, and the Turkish Kurds of the pkk, who recovered some of these weapons from the pyd and used them against the Turkish army and police.

To combat the Kurdish challenge better, Ankara began a rapprochement with Damascus under the auspices of Moscow, thereby abandoning the Syrian rebels and facilitating the fall of eastern Aleppo in December 2016. Such a betrayal of the Islamist cause by President Erdogan was poorly received by a sympathetic Turkish movement that had been strongly encouraged by the Ankara regime, and has since entered into a violent armed confrontation against it. Heavily affected by both pkk and isis attacks in 2016, Turkey ended the year with the spectacular assassination of the Russian ambassador in Ankara by a presidential guard who said he was acting to avenge Aleppo. The assassination took place on the very same day as the Anis Amri attack in Berlin. Then came the massacre at the Reina disco in Istanbul on New Year’s Eve - claimed by isis - which targeted the unfaithful way of life of foreign and Turkish patrons, and was thereby reminiscent of the 14 July massacre of the Nigois hedonists on the Promenade des Anglais, or the shoppers at the Berlin Christmas market on 19 December. The extent of the violence then affecting Turkey - in the name of the pkk but principally isis - could not but influence the Turkish government’s ability to put pressure on its emigre nationals. One might fear that those nationals would reflect the tensions from their country of origin, in the same way that France, with its large population from Algeria, was affected by jihad in that country in 1992-97, which had spilled over into the northern Mediterranean and resulted in the deadly attacks of the years 1995-96 in the Paris and Lyon regions.

In addition to these changes in the Turkish population of Germany, and the risks of increased vulnerability to jihadist temptation due to the ongoing upheavals in Anatolia, the other element of structural transformation within the German Muslim scene is the massive increase in the proportion of Arab nationals from the Middle East, as seen above, particularly after the arrival of 890,000 asylum seekers in 2015, followed by 280,000 in 2016. As the German press (Die Welt 2016) pointed out, it remains extremely difficult to estimate the number of migrants in Germany, particularly because there are different categories - those who have obtained refugee status, asylum seekers, those who are not registered at all and whose numbers can therefore only be guessed at, and so forth. The

number of arrivals is therefore probably much higher, and many sources estimate that it exceeded one million in 2015.

While the considerable efforts made by the German authorities for those granted refugee status allow for some form of oversight, there are no organizations for recent arrivals comparable to those that bind together the previously resident Turkish population, and so knowledge of the newcomers remains, by comparison, very superficial. While the vast majority of refugees are engaged in learning the German language and civilization with the help of numerous local associations, the jihadist attacks linked to several of those associations in 2016, and the canvassing undertaken in these fragile environments by jihadist recruiters, have fueled the fears - or fantasies - of a portion of the German populace. This favored the unprecedented expansion of the far right vote which, without yet reaching the scale of the National Front in France, involved coordination and collaboration between their respective leaders, Ms. Frauke Petry and Marine Le Pen. And their ideas have been dramatically reinforced by Donald Trump, who has publicly described the refugee reception policy of the chancellor as a mistake. Meeting on 21 January in Koblenz with the Dutch Geert Wilders, whose Party for Freedom (pve) favoring a ban on the Qur'an was leading in the polls preceding the March 2017 parliamentary elections,[124] the three main leaders of the far right in Europe welcomed the measures taken by the new American president to ban entry into the United States of nationals from seven Muslim countries (including dual European nationals). "Trump did well, he shows us the example," said AfD vice-president Alexander Gauland, thus echoing the "Well done!" of Mr. Wilders.

Ten days later, a major raid in the state of Hesse, which mobilized more than a thousand police officers and led specifically to the arrest of a Tunisian national, recalled the permanence of the terrorist threat. He had been denied asylum after entering Germany with the wave of refugees in 2015. He was being pursued in his own country in connection with the attack at the Bardo National Museum in March of that year, and was suspected of having organized a terrorist cell of about fifteen members that was ready to take action in the footsteps of Anis Amri. At the same time, the amalgamations of Islam, Islamism, and jihadism to which the far right is committed are feeding more than ever the divide that now threatens both German and French society, and the whole of Europe. It is only by better understanding the unprecedented challenges facing those countries, by a precise and dispassionate analysis of the European jihadist phenomenon, by freeing ourselves from the ideological blinders that have obscured it from comprehension for too long, that the risk represented by this divide can be eliminated.

** 12. Madrasas Promoting Social Harmony? Debates over the Role of Madrasa Education in Pakistan

Muhammad Khalid Masud

This chapter explores debates in Pakistan on madrasa educational reform. The study follows Dale F. Eickelman's pioneering research (1992) on mass higher education and its implications in the Middle East. The dominant discourse on the role of madrasa reform presumes the madrasa to be an institution of mass education. I follow Dale Eickelman's idea of mass education in exploring the distinction between mass education as basic education and the madrasa as an institution of professional religious education. According to him, mass education plays an important role in reshaping the meaning of religion and transmission of religious knowledge in modern settings. Most Pakistani observers, as well as the Government of Pakistan, consider the madrasa to be an institution of mass education. They believe that it should not only impart necessary religious knowledge but also reform its curricula to play a positive role in nation building, promoting literacy and human resources for development in the country.

Debates on the role of madrasa, which have been going on since the 1950s, intensified in 2017-2018. Participants in the debates remain, however, divided on the role of the madrasa. Most religious scholars argue that the madrasa imparts authentic traditional Islamic education that ensures peace and harmony, and that violence and religious extremism are caused by inauthentic Islamic education, not approved by the religious authorities. Implicitly, this argument claims the role of mass education for the madrasa. Focusing on two issues - the role of madrasas and the madrasa "mindset" - this chapter explores how ma-drasa education is reshaping perceptions of religion and religious education.

To modernists like Iqbal et al. (2015), who perceive mass education as a modern concept, madrasa education requires reform before it can become a vehicle for mass education. Traditionalists like Jallandhari (2011), who oppose reforms and modernization of religious education, regard the madrasa as essentially a professional system of education that caters to certain specific religious social needs. Islamists such as Saleem (2014), who call for de-Westernization and "Islamization of knowledge," approach the question of madrasa education from the ideological perspective and differ with the modernist and traditionalist

orientations towards madrasa education. Islamists call for decolonizing the existing Western and secular concept of mass education and for bringing it closer to the Islamic concept of knowledge and education. The governmental authorities perceive the madrasa as an institution of mass education to promote social religious harmony. The Paigham-e Pakistan, a detailed declaration against extremism issued on 10 January 2018, called upon the religious sector to discourage sectarianism in mosques and madrasas: " "ulama must play their role, where sectarianism and grouping are discouraged and all the mosques and madrasas are used only to either perform prayers or to disseminate education to our young generation in the light of the Holy Qur'an and Sunna" (Paigham-e Pakistan 2018: 31).

This perception of madrasas as an alleged source for fostering extremism has grown particularly in the post-9/11 era. Official statements at the international level in 2005 intensified this perception and since 2012, a number of publications have alleged that connection or explored the question of whether madrasas produce extremists and terrorists. Recognizing that all madrasas cannot be blamed for terrorism, questions were, however, raised about the nature of religious education and pedagogy in these institutions. Robert Jackson (2004: 15), an education scholar, noted that the events of 11 September 2001 in New York and their various ongoing concerns gave a sharp focus to issues such as the relationship between religion, national, and cultural identity, the nature of multicultural societies, and the widespread public ignorance about religions such as Islam.

In Pakistan, religious education is considered necessary for nation-building because religion is an essential part of national identity and ideology. Questions of reforms and the role of education were interrelated with the need and role of mass education in reshaping modern society and polity. Madrasas as institutions of religious education were also expected to play the role of mass education. Debates about the relevance of religion and religious education to modernization commenced as early as the colonial period. The tensions surrounding religious education remain unresolved and have complicated not only public debates but also government policies concerning basic education.

During the colonial period, madrasas were problematized as impediments to reform. In the nineteenth century they were considered opponents to enlightenment, rationalism, and scientism. In the twentieth century, they were conceived as obstacles to progress and development, and obstructions to nation-building and democracy. Since 2001, madrasas have also become a “security” concern, not only in Western but also in Muslim countries. The government of Pakistan has been trying to bring madrasas into the mainstream since 1979, accelerating these efforts after 2001.

These governmental efforts have been partially successful. Reports that the number of madrasas registered under a scheme for regulating educational institutions has seen a considerable increase is considered a positive development. Some madrasa networks have introduced English language and computer technology in their curricula. Several madrasas have launched English medium schools as part of their madrasa system. Most madrasas have introduced programs that allow students to sit for examination for regular matriculation, intermediate and bachelor’s certificates and degrees. The ambiguity about the role of Deeni, or religious, madrasas, however, still exists.

To explore this ambiguity, discussion in this chapter is divided into two sections. The first section analyzes the existing ambiguity about the concepts of mass, basic and madrasa education. The second provides an overview of the madrasa in Islamic and Pakistani history with reference to the two issues delineated above. Based on an analysis of the perceptions of participants, students and teachers, the third section offers some reflections on the religious mindset.

*** 1. Role of Madrasas

Madrasa in simple Arabic usage means place of learning (dars, lesson), school, or school of thought, not necessarily religious. In Pakistan, madrasa generally means an institution of religious education. How religious education came to be objectified as madrasa requires exploring two contexts: the modern context that objectifies learning in the broader meaning of mass or basic education, and the medieval context in which religious learning in a madrasa meant professional higher learning, distinguished from basic education called maktab. Let us first look at the concept of mass education.

**** 1.1 Mass Education

The perception of mass education has been diversified by different views about its objectives and functions in various societies. Mass education is sometimes described as a shift from education for the elite to educating the masses. It also refers to education for modernizing society, stressing shifts from religious to mass education. Sometimes it is considered necessary to forming the nationstate. Dale Eickelman’s studies on knowledge, mass education and social theory (Eickelman 1976, 1985; Eickelman and Piscatori 1996, especially the chapter on social theory) are helpful for making sense of these questions. Eickelman views the relationship between these phenomena as a social process that reshapes the concepts of education, religion and authority in modern societies. His notion that mass communication and mass higher education impact religious consciousness, influence the rethinking of self, religion, nation and politics, facilitate the reconfiguring of religious thought and action, and encourage explicit debate over the meaning of religion is quite relevant to the current debates on madrasa education in Pakistan.

Mass education is often described to encompass compulsory and basic education. Contrasted with elite and religious education in the medieval period, it aims at breaking the equation between wealth and authority in society and between religion and authority in some cases. As mass, basic and compulsory education, it stresses basic skills like reading, writing and counting. Increasing literacy is thought to promote civic sense and national cohesion. The ideas of mass education differ in developed and developing societies in various stages of economic and political development. The distinction between basic and higher education sometimes refers to different levels of education. Basic education, also called elementary and primary, aimed to impart knowledge required for the masses to function as members of a progressive society. Higher levels of primary education meant technical and professional knowledge for which children were classified for employment in various fields. Mass educational systems were supported by newly emerging nation-states and more recently since 1989 when the United Nations declared elementary education as fundamental right of every child. Religious education continued as professional or specialized education but not as one of the components of mass education.

**** 1.2 Basic Education in Pakistan

In 1947, when Pakistan came into being, a national education conference was convened, where the universalization of primary education was emphasized. Two reasons were provided for this emphasis: to redress the lack of economic development of the country, and on account of the significance of religious education for nation-building. A national plan for education was launched in 1951, and a first five-year plan in 1957. These plans could not succeed because, according to a 1959 report, people lacked the required attitude towards civic duties. Enrollment in schools was less than 50 percent probably the reason why policy makers' attention shifted to religious moral education. The report recommended compulsory religious education for spiritual and moral development, and training in scientific thinking. The Government of Pakistan resolved "to transform Pakistan into an egalitarian and literate society" (Qaisara-ni and Khawaja 1989: 2).

Nasim Qaisarani and Khawaja (1989: 1) observed that the "continuous existence of high rates of illiteracy at mass level, coupled with low participation rates at primary level," posed a serious threat to national social and economic development. We need not go into the various causes of failing reforms. What is important in this discussion is the total absence of the concept of madrasa education in educational planning in this period. There is occasional mention of mosque schools as an opportunity to enhance literacy in 1979 (Qaisarani and Khawaja 1989: 13, 32); madrasa education was, however, not part of basic education planning.

Reviewing the history of educational policies in Pakistan, in 1999, Qaisar Bengali (1999) concluded that seven educational policies, eight five-year plans and six schemes had failed even to increase enrollment and reduce illiteracy, not to speak of higher objectives. He found that sharp swings in approaches to education and a lack of political commitment to literacy or education were mainly responsible for this failure.

The co-chair of the Brookings Institution's Pakistan Education Task Force, Michael Barber (2010: 2), also complained that the system of education was very poor. One out of three primary age children were not in school, and 35 percent of those in school had no concept of mathematics. Some 60 percent of schools were without electricity and 34 percent without drinking water. Despite his optimism and clarifications that Islam was not responsible for failure in what was a poor education system, he avoided discussing religious education. He suggested three potentially inspiring narratives for national identity - (1) Pakistan as the outcome of a successful political struggle for making a real political entity, (2) Pakistan as a country with a history of several remarkable ancient civilizations and rich cultures, and (3) Islam as a religion that brought spectacular scientific advancement and values of tolerance, generosity and community (Barber 2010: 3, 9) - but did not even once mention madrasa education.

A World Bank (2014) research paper also noted low educational attainment, unskilled youth, and lower educational enrollment at all levels, than its regional peers. But it is silent on religious education. The paper notes that Pakistan’s law and order situation remains volatile - “Pakistan ranks second (after Iraq) of 158 countries on the 2012 Global Terrorism Index.” Quite interestingly, however, it observes that violence is correlated with poverty as well as growth, and that a negative correlation between violence and education was well established.

Publications coming out of the seminars, training workshops and interactive sessions with students and teachers in 2017-2018, however, point to the ambiguity in understanding the role of madrasas as institutions of religious learning vis-a-vis regular schools and colleges as institutions of mass and higher education.

**** 1.3 Madrasa Education in Pakistan

Madrasa education in Pakistan is a continuation of the tradition of religious learning in the Indian sub-continent. Most of the current issues about the role, relevancy and curricula have roots in the period before the independence of Pakistan in 1947.

According to Shibli Nu'mani (d. 1914), the history of religious education in Muslim India differed from other Muslim societies. Madrasas in India were private institutions. The "ulama opposed the official establishment of madrasas on the pattern of Nizamiyya in the eleventh century Baghdad to avoid control by the rulers. They argued that it would not serve the purpose of religious education; students would come to madrasas to pursue worldly objectives, not to seek knowledge (Nu'mani 2009: 47). Several changes were, however, adopted during the nineteenth century such as the introduction of classrooms, a fixed number of school years, the use of textbooks and new methods of education. In this context, curricula were often revised as new books became available with new knowledge on many subjects. Therefore, unlike earlier periods focus shifted from books to subjects and compelled teachers to indulge in commentaries explaining terms and issues (Nu'mani 2009: 86-92).

Shibli Nu'mani explained that, in India, “transmission” of religious knowledge meant memorizing and “authenticity” meant isnad (continued chains of transmitters) of that knowledge going back to the early generation of Muslims. In the sixteenth and seventeenth centuries, there was increased interest in the rational sciences like logic, theology and philosophy, and in religious sciences like hadith and legal theory, and new curricula were developed to accommodate these developments.

The critique of the relevancy of the madrasa and the religious curriculum was typified during the colonial period by a story told by the French traveler Frangois Bernier (d. 1688) about the Mughal Emperor Aurangzeb (d. 1707). He faulted his teacher Mulla Salih (d. 1666) for wasting the monarch's youth by teaching him Arabic grammar and the rules of Islamic law, which had no relevance in the life of a king (Bernier 1934: 156-61, cited in Kundra 2013: 10).

In addition to private tuition like the one Aurangzeb received, there were several madrasas in India. Most of them were private and were known for specialized education. Firangi Mahal in Lucknow was one of them. The Dars-i Nizami curriculum, developed by Mulla Nizamuddin Sihalawi (d. 1748) of Firangi Mahal, responded to the above critique in the eighteenth century. Almost all Sunni madrasas in India followed Dars-i Nizami. It was supported for its accommodation of local knowledge and preference for textbooks written by local authors. Another madrasa was Darul Uloom Deoband (Metcalf 1978), which had borrowed its modern educational and administrative practices from the Arabic College (originally Madrasa Ghaziuddin), a school established by the East India Company in Delhi in 1692 and that the British East India Company reorganized to meet its own needs in 1825 (Alam 2012).

In the beginning, some madrasas, including Deoband, omitted rational sciences from this curriculum. This became a basis for questioning the relevance of madrasas in the nineteenth century. In 1887, Nu'mani (2009) wrote a critique of Muslim education in India and developed a new curriculum for the madrasas (Nadwi n.d.: 245, 581-613). He recommended teaching English, Hindi and Sanskrit languages, as well as physics (Nadwi n.d.: 486-93). He explained that some modern subjects were not included because "our traditional ^cula-ma are not familiar with modern sciences [because they were] not educated in modern schools. [Also, because the textbooks are not available] in Urdu or Arabic [they] cannot teach [these sciences to madrasa students with books written in the English language] (Nadwi n.d.: 505). Nu'mani had to justify that these subjects were necessary as they helped "to enhance student's ability to read books on any subject" (Nadwi n.d.: 106).

This question of relevancy continued in the modern period as well due to ambiguity over whether the madrasa was an institution of mass education or of professional and specialized teaching. Three new major Muslim educational institutions were established in the nineteenth century. These were Darul Uloom Deoband, Madrasatul Uloom Musalmanan-e-Hind, and Darul Uloom Nadwatul Ulama. They represented three different perspectives on religion and modernity.

With its reformist approach to religion, Darul Uloom Deoband, (established in 1867) by Mawlana Qasim Nanotvi (d. 1880), declared certain social and cultural practices heretical innovations and thus defined "religion" and "religious" differently from several other religious groups. Deoband opposed Westernization and modernity and decided not to teach modern sciences and English language.

Madrasatul Uloom Musalmanan-e-Hind, established in 1875 by Sir Syed Ahmad Khan (d. 1898), and popularly known as Aligarh College, was critical of existing religious education and theology, but did not develop a separate curriculum and system for religious education. Sir Syed called for developing a new Islamic theology (jadld ^c'dm al-kalam) to respond to modernity. Aligarh's approach to education was opposed bitterly by Deoband as heretical and alien to Islamic tradition. The more effective opposition to Aligarh came from Darul Uloom Nadwatul Ulama, established in 1894 in Lucknow. The founders perceived this institution as a middle path between Deoband and Aligarh. It was closer to Deoband in its critique of Western modernity and nearer to Aligarh in adopting a critical approach to Islamic history. Embracing Arabic language as the medium of instruction, Nadwatul Ula-ma developed wider contacts with the Arab scholarship than the other two institutions.

Qari Muhammad Tayyib (d. 1983), grandson of the founder of Darul Uloom Deoband, India, and head of that institution, clarified that the founders used Dars-i Nizami as a model but introduced certain important changes. In view of the objective of preserving religious tradition, they focused on purely religious sciences. He noted that, in 1868, the number of books on logic had been reduced and that philosophy was regarded as a wicked and harmful (fann khabitha) field of study, and was thus excluded from the curriculum. The duration of the courses was extended to six years, and three-hour daily classes were introduced. He said that all these reforms were withdrawn in his day (Nadeem 2015: 17).

Commenting on the historical role of Deoband, he said that Darul Uloom Deoband had "resisted [the] transformation of Muslim society in the religious, cultural and moral domain," but for fear that Muslims would be swept away by the currents of change had instead clung to the Islamic principles of simplicity and religious piety (Nadeem 2015: 15). To achieve this objective Deoband resolved to "work for the masses rather than for the elite." While defining the role of religious education, Qari Tayyib also stressed its relevance for the masses. In a sense, madrasas were conceived as a sort of mass education but private and independent of the state.

In 1975, Mawlana Abdul Haq (d. 1988), head of the Haqqania madrasa in Akora Kahatak, Pakistan, reiterated that the job of Deeni madrasas in Pakistan was merely to preserve the religious sciences; madrasas had no capacity to do more than save the religion received from the elders, for they had neither the funds nor the resources to extend that role (Nadeem 2015: 7, citing Ahmad 2012: 80). The objective of preserving traditional learning came to mean authentic but exclusive religious education. After 2000, however, that objective came to include a broader vision. Ebrahim Moosa quotes Mufti Muhammad Taqi Usmani (2007) the vice president of Jami'a Dar al-Ulum in Karachi, saying that "one of the many noble goals of education is to strengthen one's identity, to internalize excellent human qualities, and to realize one's potential." These virtues make "each individual serve not only one's own country and community but [also] ... the whole of humanity" (Moosa 2015: 13).

Besides Deoband, several other institutions organized by the Shi'a, the Ahl al-Hadith, and Barelvis, also defined their role as preserving religion by focusing on religious sciences. This emphasis meant adherence to religious denominations and affiliation to specific schools of Islamic law and theology that defined their religious identities and that limited their roles in society on a sectarian basis. While Deobandis and Barelvis belonged to the Hanafi school of law; among the Shi'a, the Twelvers followed Ja'fari and the Seveners followed the Isma'ili school; the Ahl al-Hadith, Nadwa, Aligarh and Jama'at Islami movements did not adhere to a specific school and differed significantly in theologies and political views. This divide reflected very significantly the sectarian organization of madrasa systems in Pakistan.

**** 1.4 Organization of Deeni Madrasas in Pakistan

In Pakistan, Deeni madrasas, also called al-madaris al-‘arabiyya, continued along the traditional view that their role was to preserve denominational religious education. However, a noticeable change occurred in the 1950s with the introduction of autonomous boards to organize religious education. Each board (wafaq) was authorized to regulate examinations, curricula and other matters. The following were the main Deeni madrasa boards established during this period:

-The Ahl al-Hadith group’s organization, Jam'iyyat Ahl al-Hadith, established its board in 1955 in Faisalabad; it was later renamed Wafaq al-Madaris al-Salafiyya.

-The Deobandis, originally affiliated with Darul Uloom Deoband, India, established their board, Wafaq al-Madaris al-'Arabiyya, in Multan in 1959.

-The Barelvis, named after Mawlana Ahmad Rida Kahn of Bareilly (d. 1919), established their board, Tanzim al-Madaris al-Arabiyya, in 1959 in Dera Ghazi Khan.

-The Shi'a established their board, Majlis-e Nazarat-e Shia Madaris-e 'Arabi-yya in 1959 in Lahore (Malik 1996: 124).

Apparently, the purpose of these umbrella organizations was to pre-empt the legal impact of the West Pakistan Waqf Property Ordinance proclaimed in 1961. The government of Pakistan had then decided to integrate the madrasas and affiliate them to the educational system in Pakistan. According to Jamal Malik (1996: 125), boards were formed in reaction to the government policy of controlling the madrasas. Boards were autonomous in matters relating to curricula and standardization of examination systems.

The meaning of mass education with reference to madrasas gradually came to stress exclusivist rather than inclusive identity. The Islamist reformist movement for “Islamization of knowledge” in the 1980s that began with the resolve to decolonize knowledge aimed at mass education for Islamization also ended with Jama'at Islami establishing madrasas with its own board. Jama'at criticized traditional ‘ulama for their narrow religious vision (Rahman 2011), but in politics allied with them.

The madrasas gained political significance in the 1970s when religious political parties were organized. In 1977, a coalition of these parties called the Pakistan National Alliance launched a movement for establishing “the Prophet’s system” (Nizam-i Mustafa) in Pakistan. The religious sector under this alliance played a significant role in overthrowing what they considered an “anti-Islam” government ruled by the Pakistan People’s Party and paved the way for the Islamization of the country. In 1979, when the government promulgated the zakat ordinance, the madrasas began to receive government funds.

Madrasas remained divided into six denominations (masalik). In 1979, 354 madrasas belonged to Deobandi, 267 to Barelvis, 126 to Ahl al-Hadith, 41 to Shi'a, 57 to Jama'at Islami, and 900 to other non-specified groups. Among these, Khurshid Nadeem (2015: 7) points to an oddity; 20 percent of the population in the country are Deobandis, but they own 65 percent of the madrasas.

There were 249 Deeni madrasas in 1947, 472 in 1960, but in 1979 their numbers suddenly soared to 1,745 (Malik 1989: 279), which was clearly evidence of a growth of governmental interest in them. By 2015, the number of Deobandi madrasas stood at 20,560, with 251,482 students, and 121,879 teachers. A focus on the rising number, however, obscures more important aspects of these developments.

**** 1.5 Curriculum Reform

Curriculum reform remained a controversial issue between madrasas and the government, with the latter viewing it differently from the former. A national committee on Deeni madrasas constituted in 1978, described the following as its objectives - unifying educational and teaching systems, improving the standard of education in Deeni madrasas, enabling madrasa student participation in mainstream higher education, and providing opportunities for employment (Ministry of Religious Affairs 1979: 8, 65).

The madrasas revised their curricula, but according to their own perception of religion and religious needs. Khurshid Nadeem (2015: 12-15), for instance, explained that Dars-i Nizami classified sciences into three types of knowledge - religious, rational, and auxiliary - and selected texts for the curricula that had been written in the post-classical period, mostly between the fifteenth and eighteenth centuries. Curricular reform by the Deoband

wafaq meant reducing some or adding the number of books prescribed in the traditional Dars-i Nizami, but keeping the classification of sciences, as follows:

-The Dars-i Nizami’s religious sciences curriculum, which covered the Qur’an, hadith, and fiqh, contained twenty-seven textbooks, of which five were commentaries on the Qur’an, twelve were on hadith, nine on law and legal theory, and two on theology. The wafaq then added a further five on the Qur’an, eleven on hadith, five on fiqh, and two on theology (ilm al-ka-lam), while removing one from the list of legal theory books, and four from theology.

-The Dars-i Nizami’s rational sciences list comprised sixteen textbooks, eight on logic and eight on philosophy. The wafaq then removed eleven in all and added two new ones.

-The auxiliary sciences had sixteen textbooks, seven of which were on Arabic grammar, and two on semantics and rhetoric. The wafaq then removed one of the Arabic grammar books and two on Arabic literature, but added one to the grammar, two to the rhetoric and six to the Arabic literature components.

Academic studies on the Pakistan government’s educational policies and on the religious sector generally show a wide diversity of positions on the role of madrasas. Jamal Malik noted that the first scientific study of madrasas, organized in Pakistan in 1960 with Asia Foundation funding, was limited to a statistical survey, but he nonetheless observed that the colonial administration attached very little importance to traditional education (Malik 1996: 121, 125).

Carol Christine Fair (2009) viewed madrasas as institutions of mass education in the private sector. They were providing free education and free accommodation, food, books, and healthcare to 1.5 million children. Citing Mahmood A. Ghazi of the International Islamic University in Islamabad, she (Fair 2009: 90) quoted government officials as saying that “madrasas have contributed to the menace of sectarian violence and [an] obscurantist worldview in Pakistan” and that they produced "ulama who were irrelevant to the modern state of Pakistan. The criticism of madrasas, she found, stemmed from their failure to fulfil the role they were expected to play, namely to promote national cohesion and progress.

Fair noted resistance among the religious leaders against this expected role; they felt that madrasas had no need for reform. She (Fair 2009: 87) cited one of the madrasa administrators saying, “no one has the right to interfere in our institutions.” Citing other madrasa authorities, Fair sums up their views in the following remarks: “it is pressure from the US government,” “the Pakistan government is not sincere,” the “reforms are only

cosmetic," and there is "no need to introduce worldly subjects" (Fair 2009: 88). Fair concluded that the problem was "poorly understood outside Pakistan" and that the progress of the Pakistan government was so slow because the madrasas disregarded its views. Apparently, like the government officials, Fair was viewing madrasas as institutions of public education, but the madrasas themselves did not see themselves as such (Fair 2009: 91).

Explaining that whereas basic education was the responsibility of the state, and that the real purpose of Deeni madrasas was to train religious scholars or experts in religious sciences (Fair 2009: 409, 427), in 2011 the secretary of the Deobandi board of madrasas Mawlana Hanif Jallandhari (2011: 401), however, recommended that Deeni madrasas should promote social peace and civil harmony. He reiterated that the madrasas were already playing their part in narrowing the gap between rich and poor and creating a balance between the Westernized elite products of mainstream education and the ordinary people who send their children to madrasas.

Khurshid Nadeem (2015: 6) noted that Deeni madrasas in Pakistan had attracted virtually no serious academic attention until 1979, which was when global politics first began to recognize the significance of religion and of religious institutions to the region. This neglect made it difficult to predict that it would be a mistake to integrate and streamline madrasa education with independent wafaq boards that were strictly regulated by religious divides. These divisions, of course, allowed the madrasas to see their differences as issues of identity, and to indulge in sectarian polemics against each other. For instance, the syllabus that the Deobandi board approved included a refutation of Westernism, socialism, Qadyanism, Barlevism, Rafidism, Ahl al-Hadith, Christianity, and Zionism as alien ideologies (National Committee for Religious Education 1979: 124). The other wafaqs adopted similar approaches to their own religious identities, thereby generating religious fundamentalism, intolerance and conflict. Yet, neglecting the above-described institutional and organizational problems, the government persisted in its focus on cultivating the modern sciences in madrasas with a view to reforming the traditional mindset. The government's approach to religious studies in higher education fared no better, for teachers of Islamic studies at the universities and colleges of the various cities of Pakistan were critical of the government's authoritarian approach to reform, indifference to education and its objectives, and lack of interest in promoting research and critical studies (Mahmud and Siyal 2018).

*** 2. The Religious Mindset

Focused quantitative analyses of madrasa students' activities and perceptions of madrasa education have provided critical insights into how this social process of politicized reconfiguration of religion turned violent in the era of globalized mass communications. In 2017, The Pak Institute of Peace Studies conducted a survey among students and teachers in five madrasas in four cities of Pakistan. The project explored students' extracurricular activities, interaction among themselves and with teachers and interest in politics. The

project, entitled the “Role of post-noon engagements of Madrassa students in radical orientation,” surveyed their activities in several areas, including curriculum, co-and extra-curricular activities, use of social media, teacher-student engagement, and favorite political parties. An analytical report based on this survey was published in 2018 with the title After Study Hours, Exploring the Madrassah Mindset.[125] Even though the sample set for these findings is small, and the project is still a work in progress, it nonetheless provides significant insights about the objectification of religion and religious education in the ma-drasa environment.

The findings of the project suggest the following significant points for further exploration:

-Madrasa students are part of Pakistani society. They take part in extracurricular activities and are interested in politics and social activities, much like the youth in other educational institutions.

-Madrasa students are influenced by the social process; they interact with other youth and take an interest in public action, but their sphere of public engagement is limited. Unlike students in other institutions, theirs is a residential environment in which students have more time to interact with each other and with their teachers. This develops a bond between and among them. Most madrasa students admire their teachers, are influenced by them, and are satisfied with the curriculum and their teachers.

-Madrasa education is not mass education, but a response to the specific, professional and religious needs of the society. It emphasizes authority and authenticity, but in a manner that is different from that of mass education. This focus on authenticity and authority, moreover, discourages diversity.

-Modern education, in both madrasas and institutes of higher mass education, celebrates exactness and emphasizes authoritative approaches to knowledge. Students are not taught critical thinking, research, or teaching skills. This fosters a mindset that leads to fundamentalist and extremist views.

-Sectarianism is linked to the wafaq system of madrasa education, which sets the curricula. This system, moreover, does not allow a student to move to another wafaq for his or her education.

-State attempts to redesign mass education to raise literacy levels have been unsuccessful and the number of dropouts from primary schools is increasing (Pak Institute for Peace Studies 2018).

-In madrasa education, teachers influence students not only in class but also in extracurricular activities.

-Despite the challenges outlined above, the data about student worldviews and preferences demonstrate that the madrasa environment does provide opportunities for rethinking the role and relevancy of religious education in students' lives and reshapes their preferences accordingly. For example, students mostly describe the madrasa environment as open, and very few find it restrictive. This situation may be interpreted as an outcome of the interiorization of denominational identity. Yet the interest shown in this data regarding interaction with other Muslim groups and other faiths suggests also open spaces in this environment.

Most students spend close to one-third of their day in classes. The rest of their time is free for other activities, which may explain their feelings of relative liberty. More significantly, while the students rank Quranic sciences as their favorite subject, they rank Islamic law and theory as their least favorite, which may suggest some rethinking about religious knowledge. The most popular activity among students is participating in literary circles, and the least popular is taking part in discussion groups, in which the most discussed topic is education and the least discussed religious subjects. Most of the students read newspapers and Islamic religious magazines.

Facebook is the most popular social media platform, and the most favorite topics on it are religious. Read with the above, this choice shows that students want to discuss religious education but prefer to do so in a more open but discreet environment. Most students say that nothing in the curriculum stops them from interacting with members of other faiths or sects. A few, however, said that the textbooks and curriculum discouraged interaction; they referred specifically to subjects and texts about the faiths of minorities. Although the curriculum does not bar them from interacting with people of other faiths or from other sects, 20 percent said that they preferred not to do so.

Interaction with teachers is popular; most students spend between one and two hours a day with their teachers after study hours. Discussion with teachers pertains to the Qur'an and hadith, not Islamic law or sectarian issues. As mentioned earlier, the role of the teacher is central in religious education. The teacher is the ideal, guide, authority and model that the system expects the student to follow. Resistance to the teaching of modern sciences was also to do with the non-availability of teachers of modern subjects who would be appropriate for a madrasa environment. This perception of religious education fails to recognize anyone who has not received a formal madrasa education as a qualified religious scholar.

Notable religious leaders in India and Pakistan, such as Mufti Kifayatullah (d. 1952), Mawlana Husain Ahmad Madani (d. 1957), Mawlana Ahmad Ali La-hawri (d. 1962), Mawlana Ghulam Ghaus Hazarawi (d. 1981), and Mawlana Yusuf Bannuri (d. 1977) did not consider Mawlana Mawdudi (d. 1979), the founder of Jama'at Islami, to be a qualified religious scholar, and fatwas announcing that Mawdudi was not a truly religious scholar were issued against him. In other words, he was not qualified to speak on Islam. Mufti Kifayatullah remarked that Mawdudi had neither learned from nor been disciplined by a scholar of repute; he was well read but his understanding of religion was weak. Similar controversies arose over Sir Syed, Abu’l Kalam Azad, Muhammad Iqbal and other Muslim thinkers.

In his fatwa in 2013, Shaykh Salih Fawzan, a popular Saudi scholar, condemned self-taught scholars as Khawarij, an extremist group in early Islam. . He and called upon the masses to consult only the true ^culama. He argued that although books are a source of knowledge, they do not explain difficult words and ideas, for only a true alim can do that. The "ulama know the correct methodology as they are the heirs of the Prophet. Viewers on various websites (for example, the Facebook page, “Islam’s Finest”) share and discuss this fatwa. The debate looks anachronistic in the present age of the Internet, open universities and open courses, but it reveals the concerns of the "ulama about religious education (al-Fawzan 2013). Shaykh al-Qaradawi (on thesunnivoice.com, 2015) claimed that most extremists were self-taught and did not listen to the "ulama. He explained that self-taught individuals did not have authentic knowledge.

These debates reveal that a madrasa is perceived as a formal institution of authentic religious learning. Religious knowledge cannot be sought by reading authentic books; it can only be acquired by studying with teachers within a formal setting that authorizes graduates to speak on Islam.

*** 3. Conclusion

Discourses, debates, seminars and dialogue forums in Pakistan between 2010 and 2018 seem to have focused on two issues - the role and relevance of ma-drasas to society; and madrasa responses to challenges to religion, religious education and its authenticity. Most of the participants in these debates expressed their concern about the polemical religious teachings in madrasas leading to religious extremism. Widespread sectarian violence in Pakistan in the 1990s, years before 9/11, was traced to madrasas. Speakers at various forums have called for the need to reform madrasa education, for madrasas have been functioning as private institutions with their own curricula and teaching methods. Others, however, have said that governmental attempts to bring ma-drasas into the mainstream have complicated the already ambiguous role of these institutions.

Studies on religious education in the modern period show that people’s perceptions of religion significantly influence their academic approaches to discussions surrounding curricula, pedagogy or even the purpose of education per se (Miedema and Biesta 2004), and have contributed to varying definitions of terms such as religion, religious knowledge, religious studies, and religious education (Zubaida 2016). These different approaches have, however, not only enriched the debates but also complicated people’s understandings of religion and education. Dale Eickelman accredited this diversity to the different ways of objectifying religion in modern society - differences that have no doubt greatly affected the religious, political, social and intellectual development of Pakistan. However, as Jamal Malik (1996: 121) observed, it was only after 1979 that scholars studying madrasas in Pakistan began to explore how this diversity of views was thwarting attempts to reform religion and creating tensions between the government and madrasas over the development of religious education.

Academics today find it difficult to decide quite where madrasas fit within the complex framework of religion and education. Is the purpose of a madrasa education to provide religious instruction, to study a religion or more than one religion, to learn theology, or to train students for a life in religious service? For policymakers in Pakistan, though, the problem that madrasas pose is in the realm of educational administration and social control. They see a madra-sa education as anti-modern and therefore in need of modernization. Recent studies have mostly approached madrasa education in terms of a conflict between tradition and modernity. I have tried to look at it as a contest between the state and the "ulama for religious authority.

Modern discourses are still unclear about what role religious education is supposed to play in Pakistani society. Is it to counter terrorism by promoting peace, harmony and national cohesion? Or is it simply to impart religious and professional learning? Is it impractical to expect madrasas to deliver basic or higher mass education given that their sectarian structure under the wafaq system objectifies religion in terms of identity, authenticity and authority?

As a contributor to this volume honoring Dale Eickelman, I would like to explain my presence here besides my long friendship with him. His studies on knowledge, authority, education, and religion have been a source of inspiration not only for the present chapter but also for my other writings. I am not an anthropologist, but Dale’s anthropological approach to studying Muslim history has sparked my interest in this field of knowledge. When I came to the Institute of Islamic Studies at McGill University in 1966 to study for my PhD, Dale’s ma dissertation on Musaylima (d. 632), known as a false prophet (kadhdhab) in Muslim history, was a popular topic of discussion among students in the common room. In his ma thesis, Dale had provided an anthropological appraisal of Musaylima in which he explained the refutation as a social phenomenon arising from a tribal struggle for power and authority. As a student of law and social change in Islam, this social theory that Dale called an “anthropological appraisal” made sense to me.

An anthropological approach to the study of Islam helps one to understand that, for a believer, the religious world is just as real as the social world is for a person living in a given society. By paying attention to the role of the madrasa teacher, the formal organization of curricula, and the residential quality of the institution, we can understand the madrasa as a world of its own. Religious education functions as a social process through which to develop a particular religious mindset. This process of knowledge production and socialization generates objectifications of religion and authority, which then populate imagined communities. The religious world is separate but not isolated from the social world. Interaction between the two worlds, even if limited, influences the objectification of religion and religiosity. The narrow classification of religiosity in sectarian terms, sensitized by the continued memory, keeps reminding the religious mind of its obligation to preserve its legacy against all odds.

*** Appendix

**** Summary of the Report: Curriculum and Activities (Pak Institute for Peace Studies 2018)

1. Satisfaction with the Curriculum

a. Satisfied:121/135 (around 90%)

1. Age: below 20 yrs. (40/121)

2. Denomination: Shi'a + Jama'at Islami (23/121)

b. Not satisfied:8/135 (6%)

1. Age:6/8:2o-25 yrs.

2. Denomination:Deobandis (4/8)

c. No answer:6/135 (4%)

2. Course Duration: Most of the Students Spent Close to One-third of their Day in the Classes

a. 6 to 7 hours daily: 36 (26.7 %)

b. 5 to 7 hours daily: 89 students (67%)

c. 5 to 6 hours: 53 (39.3%)

3. Favorite Subjects Within Curriculum

a. Religious sciences: Qur’an and exegesis (95/135); hadith (87/135); Ilm-ul-Kalam (21/135), Islamic law and theory (11/135)

b. Rational sciences: logic/philosophy (14/135) auxiliary sciences: Arabic grammar (13/135), semantics and Rhetoric (20/135)

c. Outside curriculum: highest history, lowest political science History 70/135); Urdu (55); computers (47).

Pakistan studies (45); and political science (44)

4. Co-curricular Activities

i. Literary circles (107/135); reading/study groups (93); discussion/ debates (53)

ii. Topics for discussion: education (65), religion (58). Most common topic was religion in all denominations, politics and society common in Deo-bandis and Barelvis, and Interfaith among the Shi'a students (14).

5. Extra-Curricular Activities Available in Madrasa

i. Extra-curricular activities available (123), not available (9), no answer (1)

ii. Not available: 4: Barelvis, 3 Deobandi, and 1 Shia.

iii. Nature of extra-curricular activities: most available sports, availed by 16 students

iv. Sports or exercise (112), library studies (77), Internet (49)

v. Students availing the facility: sports (16), Internet (14)

vi. Topic for discussion: most favourite religion, least favourite sectarian topics

a. Religion (96 students), educational (82) politics (60), global situation (51) teachers and students (50) society in general (33) as entertainment (17) or economic activities (14). sectarian topics (11)

b. Non-curricular engagements: most favorite religious, least favorite political processions

c. Religious programs (89 students), sightseeing (37), entertainment and sports (35), social welfare (49), political processions (7)

6. Political Activities

a. Favorite political party: most favorite jui, least favorite Majlis Wahdat

b. Affiliation

1. Jamiat-e-Ulema Islam (jui): 37 (32 Deobandi students);

2. Jamiat Ulema-e-Pakistan (jup): 20 (17 Barelwi);

3. Jama'at Ahl-e-Hadith (jAh): 12;

4. Tehreeke-Islami Pakistan:4;

5. Ahle Sunnat Wal Jamaat: 14;

6. Jama'at Islami: 10,

7. Tahreek Insaf: 10:

8. Pakistan People’s Party: 3;

9. pml-n: 5;

10. Majlis Wahdat-e-Muslimeen:1

7. Social Media Usage

a. Most popular is Facebook, most favorite topic religion

b. 106 (78%) students use social media, 24 (18%) do not. Five students explained that social media do not enhance intellectual capabilities.

c. Type of social media: Facebook (99), WhatsApp (63).

d. Topics discussed on social media: religious topics (63), educational/schol-arly issues (52), political affairs (49), global situation (30)

8. Newspaper reading: 95 students read newspapers 32 do not

9. Interaction with teachers: majority spends extra 1-2 hours daily with teachers

1. 120 students said yes, 11 no.

1. Duration of interaction with teachers: longest duration: more than 2 hours (6 students), largest number spends 1-2 hours interacting students 112 (1-2 hours).

a. 2 hour and more (6), 1-2 hours (112), less than 30 minutes (20), 30-60 minutes (28).

Sample: Total number of students: 135, majority 18-25 yrs.

Table 12.1 Age groups of students

Age group	Number and percentage
26-30 yrs.	14 (11%)
21-25 yrs.	81 (60%)
18-20 yrs.	72 (53%)
16-17 yrs.	13 (10%)

Source: PAK institute for peace studies (2018)

Table 12.2: Teachers’ age groups

Total number 142

Age group	Numbers and percentage
51-60years	9 (6.33%)
41-50	29 (20.42%)
31-40	25 (17.6%)
25-30	29 (20.42%)

| 23-25 | 25 (17.6%) |

| 20-22 | 25 (17.6%) |

Source: PAK institute for peace studies (2018) |

Table 12.3 Students: Masalik divide and favorite subjects

| Subject | Deobandi | Brelawi | Shi'a | Ahl al-Hadith | Jama'at Islami |

| Qur’an, hadith | 76 | 54 | 14 | 13 | 7 |

| Islamic law | 23 | 32 | 11 | 2 | 1 |

| Theology | 23 | 1 | 7 | 2 | 1 |

| Logic/philosophy | 14 | 6 | 14 | 0 | 1 |

| Arabic language, literature and rhetoric | 4 | 4 | 7 | 2 | 3 |

Source: pak institute for peace studies (2018)

Table 12.4 Teachers: Expertise, favorite subjects

| No. of teachers | Expertise | Numbers | Favorite subjects outside the curriculum |

| 117 | Qur’an and hadith | 73 | Computer science |

| 59 | Islamic law | 68 | History |

| 10 | Islamic theology | 61 | Urdu |

| 10 | Logic and philosophy | 49 | Natural sciences |

| 37 | Arabic grammar | 49 | Pakistan studies |

</biblio>

[1] The phrase “Arab Spring” has been widely contested in Tunisia. research from sociology, linguistic anthropology, and field sites in the Middle East to consider how producers of Internet content coalesce as novel communities of shared interest, and how this process might lead to new discourses and even political change.

{1} My thanks to Yaron Ben-Naeh, Yaron Harel and Ari Eitan for discussions on this chapter, and to Joshua Schoffman and Daniel Goldberg for help in understanding the cases discussed.

[2] The manuscript subsequently appeared as a book in Hebrew (Ha-Cohen 1978), but there is a translation of part of it into English in Hakohen (1993).

[3] The term sofer does appear as an appointed position - assisting the court - in a document reflecting Tripoli in 1915, after changes imposed by the Italian administration (see de Felice 1985: 37, 309n.28; and note 5 below). The individual appointed also uses the

Judeo-Arabic ktab beit din (be-trablus) to describe his role. See Henshke (2011) who notes that Hakmon also provided notarial services to individuals for a fee.

[4] I use “civil law” to condense Hacohen’s phrase: “laws regarding monetary matters (dinei ma-monot) and the ways of society.”

[5] The parentheses are in the original. Maran means “our teacher” and refers to Sephardi scholar Yosef Qaro (Toledo 1488-Safed 1575), author of the rabbinical compendium, the Shulhan Arukh (“Prepared Table”). This rabbinical code became standard in the Jewish world, and accepted among Ashkenazim with the intercalated glosses of Moses Isserles of Krakow (1520?-1572). By mentioning “our teacher,” Hacohen points to Qaro’s original compendium. As elsewhere, he here adds parenthetical remarks about the (prescriptive) law, in contrast to a practice he describes.

[6] Hacohen often provides both the Hebrew and Gregorian year. The correspondence is always partial, as the former begins in the fall. The early months of 5673 also could be 1911. The date here is of interest because that was the period of the Italian occupation that entailed - until subsequent changes - a halt in the operation of Jewish and Muslim courts (de Felice 1985: 37).

[7] This episode is part of the narrative cited above in Ha-Cohen (1978: 148).

[8] “Nimus” (singular) appears in Talmudic literature with a range of meanings, including law, accepted norms, and custom. Hacohen calls the Ottoman Empire Togarma, the name of a people appearing in Genesis 10:3 (and elsewhere). This usage became common in the Hebrew press in the latter part of the nineteenth century until Ottoman rule over Palestine ended. Some examples are found in Yuval Ben-Bassat, “At the crossroads: newspapers in the Yishuv [Jewish community in Palestine] and the Young Turk Revolution of 1908,” Qesher 37 (Spring-Summer 2008): 71-81 (in Hebrew).

[9] Ha-Cohen, Higgid, 260.

[10] In Section 86 and elsewhere, Hacohen frequently refers to the judges with this term. I believe it has dismissive echoes. The biblical noun 'edah translates as community, congregation, or assembly. It can be neutral, while in post-biblical Hebrew may carry negative connotations based on the story of Qorah - who rebelled against Moses and Aaron (Numbers 16-17) - whose followers are called 'adat Qorah. In addition to signaling divisiveness, Hacohen may imply that the judges joined forces to protect their interests. Earlier (p. 203), he uses the term 'adat ha-shohatim to describe the

ritual slaughterers in Tripoli whom he depicts as a guild. One also might infer that viewing judges as a “flock” detracts from an image of individual integrity. Yehuda Kahalon’s (1972) analysis of Hacohen’s discussion of the judges, regarding issues of education, reflects a similar sense.

[11] “Examine privately” is my rendition of le'ayyen be-seter, which ostensibly should be translated: “examine (study) secretly.” This choice stems from Talya Fishman, Becoming the People of the Talmud (2011: 52-53). She translates the phrase megilat setarim (based on the same stem, S T R) as “a sequestered scroll” (that is, not studied publicly), in reference to the Geonim in Iraq who widely transmitted Talmudic literature. Books of halakha were not “secret” in Hacohen’s time (while one needed an education to understand them), and I thus find his use of S T R as resonating with Geonic usage as interpreted by Fishman. Beyond that, if this analysis is correct, it suggests that there is much more to discover about the world of learning to which Hacohen was exposed.

[12] Isaac Al-fasi (1013-1103), Maimonides (113?-1204), and Asher ben Yechiel (125?-1327) were the three prominent codifiers on the basis of whose work Yosef Qaro composed the Shulhan Arukh (see note 4).

[13] One would like to know what constituted this “study” and if it entailed any knowledge of Arabic. Marglin (2016: 74-75), shows that a Jewish merchant might learn about Muslim law through being present in the courts or other experiences, and would provide advice to Muslims, and even serve as their wakil. Parallel situations, while not formally equivalent, have been described for Yemen (Wagner 2015).

[14] Hacohen also mentions appearing in Muslim courts while in an Italian court, when he was approached as knowledgeable about local history soon after the Italian occupation (Goldberg 1996).

[15] Ha-Cohen (1978: 170), describes Hafez Pasha’s firm steps to improve security and the administrative-legal situation in Libya: “He wiped away the tears of those oppressed in court, and justice was established on a firm base.”

[16] This explicit statement clearly invites the perspective of Lawrence Rosen (1989), who draws on both fieldwork and comparison to stress the social contexts and cultural underpinnings of Islamic courts in Morocco and elsewhere.

[17] Raccah (1960: 76-77) inserts a genealogy from one of Cohen’s books leading back to biblical Ezra, who was a kohen (priest). This reflects the belief of many priestly families in Jerba (Slouschz 1927: 287-92; Udovitch and Valensi 1984: 8).

[18] There is an open question regarding Haim Cohen. It appears, from the last case summarized below, that he had financial means. That he published so many books suggests that he, or his family, or a patron, could support this activity. Speculating further, it might also help explain why he held the position of av beit ha-din for so long: perhaps a person who was financially secure could be relied on as a judge?

[19] For a partial exception to this statement, see note 2 above.

[20] Serendipity is further illustrated in Goldberg (2012: 109-22).

[21] See the Library of the aiu in Paris, Manuscript A 325 H.

[22] That manuscript, Ms. Heb. 8°5775, was deposited by the literary critic, professor of Yiddish and politician Dov Sadan (1902-1989), who probably received it from Slouschz; in fact, Slouschz may have used it as the basis of his 1908 article.

[23] The Jewish Publication Society republished it in 1944, probably as a result of the United States entering North Africa and “finding” a large Jewish community there.

[24] It arrived in the mid-1940s and is now filed under Ms. Heb. 28°1292. The catalogue records that in 1967, Yehuda Cohen, his wife, and a sister named Sarah confirmed the donation to the library.

[25] Hebrew Manuscript division, 4°1256.

[26] This was Yehuda Kahalon, whose article based on the thesis (Kahalon 1972) is cited in note 9.

[27] The article was first published in 1910. See also Gilani (n.d. 339-60). My argument here is much indebted to these two works.

[28] For a sustained effort to separate the institution of the madrasa in medieval Islam from the transmission of learning, see Chamberlain (1994), who is concerned primarily with social rather than intellectual practices; to the extent that he discusses the latter, he is interested in exploring them as “ritual, mimetic and performative,” whereby the political and social elite strove to reproduce their ranks. See p. 108, for the quotation; pp. 125-30 on the “ritualization of knowledge,” and pp. 133-51 on “rituals of reading, rituals of writing.” See Bourdieu (1973: 71-112) on education as a means of elite social reproduction. As should be clear from what follows, my argument that practices rather than institutions explain pre-and early modern Islamic learning emphasizes rather than sidesteps the 'ulama’s intellectual and religious tradition.

[29] The moral philosopher Alasdair MacIntyre (1984: 187) usefully defines a practice as “any coherent and complex form of socially established cooperative human activity through which goods internal to that form of activity are realized in the course of trying to achieve those standards of excellence which are appropriate to, and partially definitive of, that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved, are systematically extended.” It is not easy to draw a sharp distinction between a practice and an institution, though an institution can be broadly understood as comprising mechanisms to regulate behavior and constrain practice. An institution is therefore usually more structured and less flexible than a practice might be. Unlike an institution, moreover, a practice finds its meaning, as MacIntyre noted, through the pursuit of goods internal to the activity in question. For an influential definition of institutions, on which I draw here, see North (1981: 201-2); see also Glaeser et al. (2004: 275).

[30] My references are to the Persian text, unless stated otherwise.

[31] On ‘Abd al-‘Ali, an important, near contemporary source is Ansari (1881: 121-27). The work was completed in 1836, though the published version contains a continuation of it by the author’s son, Muhammad In‘am Allah, which comes down to 1878 (see Ansari 1881: 138-40). Other sources and studies on ‘Abd al-‘Ali include Ahmed 2002; ‘Ali 1914: 122-23; ‘Inayat Allah 1988:207-12; al-Hasani 1947-70, vol. 7:282-87.

[32] Rather less credibly, perhaps, 600 students and scholars are said to have accompanied him when he decided to go to Madras, now Chennai, at the invitation of the ruler of Carnatic (Hasani 1947-70: vol. 7, 285).

[33] A significant contrast is to be observed in this respect between Sultanate and Mughal India, on the one hand, and the Ottoman Empire, on the other. On early Ottoman madrasas, see Atgil (2017: 28-45). On the relative dearth of similar institutions in pre-colonial India, see Gilani (n.d.:346-60).

[34] See Stewart (2004: 49-52) on the need to distinguish between the different sorts of authorization (ijaza) required to transmit and teach particular texts.

[35] Gilani (n.d.: 142-45) understands danishmandi to connote the basics of a religious education.

[36] For a discussion of tatbiq in its various forms, see Shah Rafi‘ al-din (n.d.): 42a ff. Rafi‘ al-din was Wali Allah’s son and a noted scholar in his own right. Wali Allah’s views on effective pedagogy have some broad parallels with those of Ibn Khaldun (1858: vol. 3, 292-98), though he does not appear to have been acquainted with the latter’s work.

[37] To avoid confusion between Wali Allah Ansari and the better known Wali Allah of Delhi, I include Ansari as part of the former’s name whenever I refer to him.

[38] Another rationalist stream was embodied by scholars associated with the north Indian town of Khayrabad, who were active in the second half of the eighteenth and especially during the nineteenth century. For a brief introduction to their work, see Ahmed and Pourjavady (2016:616-18).

[39] See Wali Allah (1858: 2). Also see Husain (1912: 164) and the translator’s notes, on which I draw here, for a listing of the key texts he had studied as part of his education. The works in question included Qutb al-din Razi’s (d. 1364) Tahrir al-qawa"id al-mantiqiyya fi sharh risalat al-shamsiyya (commonly known as Sharh-i shamsiyya or al-Qutbi); the commentary by Qutb al-din Razi on al-Urmawi’s (d. 1283) Matali" al-anwar; al-Taftazani’s (d. 1390) Sharh-i "aqa"id (which, in turn, is a commentary on al-Nasafi’s [d. 1142] "Aqa"id); al-Khayali’s (d. c. 1457) glosses on a commentary by Taftazani; and al-Sharif al-Jurjani’s (d. 1413) commentary on al-Iji’s (d. 1355) Kitab al-mawaqif. More generally, see Brentjes (2018:94-96, 149-55, 161-68).

[40] It is common to render al-‘ulum al-naqliyya (“the transmitted sciences”) as the “religious sciences,” but the “rational sciences“ (al-‘ulum al-‘aqliyya), from which they are distinguished, were arguably also “religious sciences.” On occasion, “religious books” (al-kutub al-diniyya) are nonetheless distinguished from those in the rationalist (‘aqliyya) tradition, as in Wali Allah’s Persian autobiography (Husain 1912: 173).

[41] The students in question were Mirza Hasan ‘Ali Muhaddith and Husayn Ahmad Malihabadi.

[42] I follow the English translation (Jalbani 1982: 84) with several modifications. On his wish to avoid the rational and the transmitted sciences in this work, see Wali Allah (1894: 2).

[43] This Persian commentary, Madin al-jawahir, was in seven volumes, but I have been unable to locate it. The only other Farangi Mahall scholar to have embarked on a commentary on the Qur’an was ‘Abd al-Bari (d. 1926), though he died before he had made much progress on it (‘Inayat Allah 1998: 281). As for the study of hadith, only the Mishkat al-masabih of Muhammad b. ‘Abdallah al-Khatib al-Tabrizi (fl. 1337) was usually taught in the area of hadith by Farangi Mahall scholars (Nu‘mani 1934b: vol. 3, 99).

[44] For Anwar al-Haqq’s studies with ‘Abd al-‘Ali Bahr al-‘Ulum, see Ansari (1881: 35). It is worth noting that Anwar al-Haqq found his mystical proclivities to be in accord with the transmitted rather than the rational sciences (Ansari 1881: 35-36). Shah Wali Allah would have concurred with this view.

[45] A notable example of his writings in this area is Laknawi (1995). This is a commentary on al-Sharif al-Jurjani’s (d. 1413) abridgment of Sharaf al-din al-Tibi’s (d. 1343) work on hadith methodology.

[46] Given Wali Allah’s hadith scholarship and his emphasis on ijtihad (the derivation of legal norms from the foundational texts) the Salafis, too, revere his memory. Yet his Sufism makes him an inconvenient figure for them. Many Deobandis, too, have not warmed to particular aspects of his thought, but they can embrace much more of it, including a good deal of his Sufism, than can the Salafis.

[47] See appendix titled “Khatimat al-tab‘,” to Wali Allah, n.d.b: 107-8). The appendix bears the name of Sayyid Zahir al-din, who is always introduced as the maternal grandson of Shah Rafi‘ al-din. In fact, as noted, he was the great-grandson of Rafi‘ al-din (Barakati 1976: 189).

[48] See the title page of Anfas-i Rahimiyya, a book by Shah ‘Abd al-Rahim, published at the Matba‘-i Ahmadi (‘Abd al-Rahim n.d.), and Zahir al-din’s announcement (“mufid-i 'amm”) appended to this work at p. 40.

[49] For various announcements to this effect, see Wali Allah n.d.c., appendix, (“Sahiban-i ‘ilm ko mizhda”); and Wali Allah n.d.d, appendix (“Ittila‘-i daruri”): 87-8. (I am grateful to Zain Shirazi for his help in obtaining a copy of this work.)

[50] Zahir al-din, “Mufid-i ‘amm,” appended to ‘Abd al-Rahim n.d.: 40. Ibid., for 1892 as the date when teaching had begun at Zahir al-din’s madrasa.

[51] For some examples of references to the Madrasa-yi Rahimiyya in modern scholarship, see Baljon 1986: 2; Metcalf 1982: 36; Pernau 2013: 47-55.

[52] For his full discussion of the Madrasa-yi Rahimiyya, see Barakati 1976: 80-95. I am indebted to this work for helping me identify some of the sources on which I have drawn in this discussion.

[53] See “Extract from the Proceedings of the Honourable Governor-General in Council in the Political Department under the Date the 18 July 1807.” Revenue Records of the Delhi Residency, Punjab Archives, Lahore. The quoted words are from a petition made on behalf of Shah ‘Abd al-‘Aziz to W. Spedding, the Superintendent of Revenue. (I am grateful to Mr. Abbas Chughtai, director of the Punjab Archives, for assisting me in consulting this item.) Much of this document is also reproduced in Rizvi (2004: 85-90).

[54] The focus of the current comparison is on Geertz’s (1971) Islam Observed and Eickelman’s (1976) Moroccan Islam, so does not include all the works on the topic by these scholars.

[55] Geertz built his analytical model on the idea that all anthropological studies conducted on religious beliefs and practices since the end of World War ii until the mid-1960s (prior to the 1966 appearance of his essay on “religion as a cultural system”) were devoid of theoretical novelty, since they were merely based on the conceptual heritage left by the pioneers Durkheim (d. 1917), Weber (d. 1920), Freud (d. 1939) and Malinowski (d. 1942). Geertz defined his duty as to develop the cultural dimension of the religious analysis, following thus the track of Weber and his followers.

[56] He believed that history began in Morocco with the introduction of Islam in the seventh century. One century later this religion became the unique power in the country. After three centuries, the great age of “Berber Islam” emerged through the succeeding Almoravid and Almohad dynasties. Morocco took shape as a nation in the period between 1050 and 1450, and Islam became its dominant religion (Eickelman 1976: 18; Geertz 1971: 5).

[57] The famous Berber proclamation (daher) of 16 May 1930 removed the Berber (Amazigh) speaking region of Morocco from the jurisdiction of Islamic law. The goal was to foster a separate Amazigh (that is a non-Arab and to a certain extent non-Muslim) identity. According to Jacques Berque (1962), the Berber daher was a French colonial attempt to create a Berber ethnographic reserve or national park.

[58] The conclusion is undoubtedly risky, but pertinent to state here because of its potential epistemological value.

[59] I was granted the opportunity to sit with the two men, both together and on separate occasions, and the respect, appreciation and firm friendship they clearly displayed for one another was notable. Eickelman's (2009) article on the influence of Geertz's works on anthropology in Morocco bears testament to the constancy of that relationship.

[60] [[http://www.vam.ac.uk/content/articles/s/study-room-resource-the-great-exhibition/] [http://www.vam.ac.uk/content/articles/s/study-room-resource-the-great-exhibition/]] (last accessed 18 March 2020). On the hand-in-glove relationship between the world fairs of the nineteenth century and the modern museum, see Konig (2016); and Rydell (2006).

[61] Figures produced at the start of the twenty-first century by Heath (2004: vol. 2, 628-29) regarding the interest of British Muslims in visiting British museums with permanent displays of Islamic material culture make for sombre reading. Although Heath subsequently published his (downloadable) dissertation, the book version (Heath 2007: 116-17) does not appear to include all the figures.

[62] On the translator and his time in Europe, with specific regard to what and how he saw there, see Naddaf 1986: 73-83.

[63] How appearance is understood, either as an optically registered, surface phenomenon that is seen solely in the presence of light or as something prototypical and more profound that is not seen solely in light, is a key distinction between modern (quattrocento and later) and medieval Western visuality. (On this distinction, see Greenstein 1997.) As John Berger (2001: 145) notes regarding the former (modern) visuality, "all drawing is a shadow around light." In this same modern visuality, as Henri Bergson (1929: 200) observed, there is no distinction between perception and the thing perceived. (For a penetrating exploration of the phenomenon of dis/appearance in optically naturalistic quattrocento and later Western art, see Hagi Kenaan 2020:53-113.)

[64] The Persian miniatures of the so-called atelier of Kamal al-Din Bihzad (d. 1536) are often said to be one of the rare moments of optical naturalism in Islamic art. See, for example,

Oliver Leaman’s (2004: 165-78) interpretation of these paintings as exhibiting “a concentration on the surfaces and shapes of things [and] little in the way of the representation of secrets behind ... appearance.”

[65] Notwithstanding the factual errors Hans Belting (2011) introduces into his analysis of Islamic theories of vision, specifically the theory of Ibn al-Haytham (d. c. 1040), and ignoring the predictably territorial and ungracious treatment meted out to it by certain Islamic art historians, in my view his counterposing of (predominantly anti-naturalistic) Islamic art and (naturalistic) quattrocento art is provocative and stimulating. Is A. Mark Smith correct when he asserts that Ibn al-Haytham’s theory of vision was, pace Belting, “profoundly iconic”? Did not Joel Snyder get the matter correct decades ago when he said that retinal impressions were first understood iconically - as pictures, not as forms (Eidos) - in quattrocento Europe by Alberti (d. 1472), and that this understanding led to the invention of linear perspective or at least to vision’s mathematical codification via the science of optics? (Snyder 1980: 520; Smith 2013:525-26).

[66] See Smith 2015: 325-26 for a more dispassionate account of the importance of early-modern developments in glass-making to lens-based science.

[67] See Anderson 2003: 329, who specifies that the gridded frame contains transparent glass, while others have supposed it to be unglazed; and Andrews 2016: 421-24, who analyses the historical development of the woodcuts and suggests that the bottom one may not be by Durer.

[68] On the direct connection between linear perspective painting and the camera, and thence photography, see Snyder 1980.

[69] See Lookofsky 2016: 211-14 for a finely nuanced discussion of what else this storefront is, including its connection to the Great Exhibition at Crystal Palace.

[70] As John Onians (2016: 311-12) points out, it is a mistake to view this painting as a kind of male locker-room joke, especially because Courbet made a number of “origin,” or source paintings, and only one involves female genitalia. In addition, this one particular source painting, which shows a mostly disembodied vagina, was preceded by some 150 years by a Tibetan Buddhist fresco of the same subject, except that the more obviously cosmic vagina of the fresco is totally disembodied and painted without regard for optical naturalism (Baker 2000: 64-65). As Uparella and Jauregui (2018: 90) have shown, Courbet’s painting was also preceded by a European Enlightenment tradition of anatomical representations of the female genitalia and uterus, which reduced the female body “to a pelvic body, with no arms, legs, or head,” exactly as Courbet’s painting does. That Enlightenment tradition was in turn preceded by a little-known quattrocento tradition of placing the vanishing point in the Virgin

Mary’s uterus (Moffitt 2008: 167-82). Courbet’s painting is thus not idiosyncratic, but belongs to what Uparella and Jauregui (2018: 81) call a “gyneco-scopic regime.” I thank Jonathan Bloom for alerting me to Uparella and Jauregui’s article, and John Gibson and Christian Luczanits for their help with the Tibetan fresco.

[71] The paradoxical reversibility of the vanishing point and viewpoint is explained by Bryson (1983: 107) as follows: “[The] vanishing point marks the installation within the painting of a principle of radical alterity, since its gaze returns that of the viewer as its own object: something is looking at my looking: a gaze whose position I can never occupy, and whose vista I can imagine only by reversing my own, by inverting the perspective before me, and by imagining my own gaze as the new, palindromic point of disappearance on the horizon.” On the basis of this paradox, it follows that “the epoch of the vanishing point [is] the transformation of the subject into object” (Bryson 1983: 107; see also Bryson 1984: 220n.15).

[72] In a personal communication, Teresa Pepe made the same observation about Egyptian bloggers when she said that “many Egyptian bloggers actually met online, by reading and linking each other, but then the online community also turned into a real social group that interacts and meets offline. Many young Egyptian, who were intentionally writing about themselves using their real names, used blogs as forms of self-expression but also to join a new social group.”

[73] Its engineers conceived and built the Internet as a stack of programs that give access to lower-level functions. The base software, tcp/ip, is itself such a stack: it “delivers” telecommunications signals to programming that organizes and sends messages. Programs for remote login and file transfer are stacked on those functions and in turn become platforms for adding others. The practical concept becomes reflexive ideology for Web 2.0 developers who use the World Wide Web as their platform and devise additional ones on which to attach others that encode “higher” levels of user behavior by weaving those into a web of “social networking” (Lacy 2008).

[74] Such elective affinities are what Facebook collects and targets for advertising tailored to its users (Mezrich 2009).

[75] They also found, and more controversially, this to be an advantage of the middle class, with more extensive networks of weak ties, while networks among working class people tended more towards strong-tie nodes.

[76] Zuckerman’s examples were early celebrity bloggers (like Hosein Derakshan, or Salman Pax), whom he treated as indigenous analysts, but with whom those who sought them out - indeed could seek them out - shared a language and online location.

[77] This is Google’s business model (see Levy 2011) and a contemporary version of the idea that automating lower level tasks frees operators for higher level ones, whose touchstone expression for computer designers has been the Atlantic Monthly essay by Vannevar Bush (1945).

[78] Transcriptions for Maghribi proper names and places follow protocols still in use and familiar to North African readers and scholars set forth in MacGuckin de Slane and Gabeau (1868), for example, “Cheikh el-Arab” and “Hallaoui” instead of variants of Shaykh al-Arab and Hallawi.

[79] Earlier Protectorate decrees regulating the prison regime were the dahir s of 11 October 1915, 11 April 1927, and 26 June 1930, which produced not only inmate labor in the service of the French empire on behalf of public works projects, internal prison labor, work in industry, or private colonization enterprises, but also institutionalized and racialized prisoner segregation of Europeans and Moroccans.

[80] A rare voice against destructive effects of French colonial decrees was Paul Buttin (1995), a French-born lawyer admitted to the Moroccan bar during the Protectorate. See Eickelmann (1974: 215-35) on maintaining the machinery of the Protectorate.

[81] I began my project on political prison literature in the early 1990s with limited access to a group of Marxist former prisoners thanks to introductions by Sion Assidon. Throughout the project in 1990-2000, I received the unqualified support of Dale Eickelman, Mark Tessler, Daoud Casewit and the Moroccan-American Fulbright Commission in Rabat, the American Institute of Maghrib Studies (aims), the Council for American Overseas Research Centers (caorc), my home universities, and various Moroccan human rights associations. Most interviews were in private homes until 1999 when interview situations were undertaken in public spaces of meetings, reunions, commemorations, and courthouses after the death of Hassan ii. For examples of meetings with Islamist political prisoner groups, I first encountered members of Islamist Group 26 at the Casablanca headquarters of the Association Ma-rocaine des Droits Humains (amdh) on 28 October 1999 during an open house campaign to register information about victims of human rights abuses; demonstrations such as the “National Day for the Disappeared” on 29 October 1999 held in front of the Rabat Parliament; on 10 December 1999 at events marking the anniversary of the Universal Declaration of Human Rights held at the Casablanca home of the Manouzi family on behalf of the Comite de coordination des familles des disparus et victimes de la disparition au Maroc, where I was introduced to members of another Islamist Group 71. This snowballed into more interviews and meetings during public performances, such as the sit-in on 4 May 2000 in front of Casablanca’s Derb Moulay Cherif torture center. I spent long hours with the legal and human rights community of activists as an observer to the May-June 2000 trial of three Islamist political prisoners still in prison and accused of attempted escape from Casablanca’s Oukacha prison (see Slyomovics 2005).

[82] I echo their word “Islamist” because in interviews in 1999/2000, the members of Group 26 described themselves to me as Islamistes in French and Islamiyun in Arabic.

[83] Hamdouchi (1999: 45, n.76, n.77) notes that fourteenth-century written police reports in the Islamic world predate the French proces-verbal; he cites texts concerned with the duties of the police to take down written reports by the fourteenth-century Malikite judge, Ahmad ibn Yahya Abu al-Abbas al-Tilimsani, called al-Wansarisi (1937: 13).

[84] Cheikh El Arab’s aliases include al-Haj (French spelling as El-Hadj) and Agouliz, his birthplace as his surname. Newspaper coverage of the time was provided by Le Petit Marocain 14826 (8 August 1964): 1-3.

[85] See protest and action alert letter by Reporters sans frontieres (rsf) at [[http://www.ifex.org/fr/content/view/full/4327][www.ifex.org/fr/con-]] [[http://www.ifex.org/fr/content/view/full/4327][tent/view/full/4327]]; ‘La Verite sur le complot’ (in November 1963 special French language supplement of Al-Tahrir), the weekly newspaper of the UNfp’s student section in Paris.

[86] Moroccan newspapers published several individual testimonies by Archane’s torture victims (for example, Jamai 1999: 11). In 1999, the amdh issued a press release naming Archane among Morocco’s known torturers, as did articles by Ahmed Jawhar in the Arabic-language weekly al-Sahifah of 4-10 January 1999, though these were preceded by an interview and cover story in which Archane denied all charges. In fact, disputing the accusations, Archane successfully sued journalist Narjis Rerhaye of the francophone daily L’Opinion. A Moroccan court ruled in favor of Archane and ordered Rerhaye to pay him symbolic damages to the tune of one dirham (approximately 10 cents).

[87] Permission by the local pasha to enter the fortress of Kalaat M’Gouna and surrounding area was quickly granted to our group of researchers, but we were refused official permission to enter Agdez.

[88] Benzekri had died of cancer in 2005 at the age of 55 and was buried in his home village of Ait Ouahi, 60 miles from Rabat (see [[http://www.atlasinfo.fr/Maroc-profanation-de-la-tombe-de-Driss-Benzekri-ouverture-d-une-enquete-judiciaire_a42019.html][http://www.atlasinfo.fr/Maroc-profanation-de-la-]] [[http://www.atlasinfo.fr/Maroc-profanation-de-la-tombe-de-Driss-Benzekri-ouverture-d-une-enquete-judiciaire_a42019.html][tombe-de-Driss-Benzekri-ouverture-d-une-enquete-judiciaire_a42019.html).

[89] The global technology of videoconferencing has offered students lively educational experiences and cross-cultural exchanges. Dale Eickelman, at Dartmouth College, and I, at the United Arab Emirates University, coordinated and conducted several videoconferences in which students from across the globe took part in cross-cultural exchanges and discussions on a variety of topics.

[90] The Shi'a Muslims observe what is known as taqlid, a commitment to follow the advice or utterances of a certain religious scholar ("alim, marja", or mujtahid). Though the concept of taqlid is to a certain extent shared by both Sunni and Shi'a Muslims, there is a significant difference between them particularly in doctrine and practice. Taqlid means “accepting an opinion concerning a legal rule without knowledge of its bases” (Peters 1980: 135). Several scholars state that for Sunni Muslims, “the obligation of taqlid, however, was never universally accepted” (Peters 1980: 136). According to Ayatollah Sayyid Muhammad Kazim, without “this commitment the action and prayers of all Muslims were void even though in reality they were correct and in conformity with shari"a” (Moussavi 2005: 527). But these doctrines are completely different from the Catholic priesthood, in which a priest exercises authority over a person or group of people through a connection with the Divinity (el-Aswad 2012: 157).

[91] I would like to acknowledge the support of the Gerda Henkel Foundation for the work I undertook on Salafism during a 2016-19 fellowship.

and nuances recent research correctly foregrounds these three categories, I assume that all branches of Salafism can be subsumed under two major Salafi approaches to society and politics - activism and quietism. However, insofar as this issue is connected with much broader discussions of the highly contested concepts of activism and quietism in Islam, it is only touched upon while its more detailed analysis remains out of the scope of the present chapter.

[92] On Geertz as Eickelman’s teacher in Chicago see Eickelman (2005).

[93] Given the irony that the term “ideology” has itself become “thoroughly ideologized” (Geertz 1973: 193), I use it here in a “non-ideologized” sense. As an integral and constitutive aspect of all human culture, ideology is used here to denote “a relatively cohesive, dynamically evolving, set of collectively held ideas or beliefs” (Griffin 2006: 81).

[94] On the genealogy of the terms Islamism and Islamic fundamentalism, see Kramer 2003.

[95] On the relevance of Gadamer’s hermeneutics to legal thought and the interpretation of authoritative texts from the past, see Mootz iii 2016.

[96] Recently, the notion of a “comprehensive doctrine” in relation to the “overlapping consensus” has been heavily weighed down with a Rawlsian theory of justice (Wenar 2004: 265-75). I use the term differently to designate the “more comprehensive” dimensions and scope of doctrines that transcend the “dogmatic” meanings of the teachings or canons and, by encompassing the social world, provide religious underpinnings to public morality, collective identity, and politics.

[97] For a recent example of an approach of this type, see Elbasani and Tosic 2017.

[98] As Bevir (2004: 201-3) explains it, “essentialists equate traditions to fixed essences to which they ascribe variations” while “traditions are not fixed entities people happen to discover. They are contingent entities people produce by their own activities.”

[99] In some cases, accusations of “essentialism” are even raised towards academic works, which can hardly be qualified as “essentialist” (Evstatiev 2019: 89).

[100] Some scholars presume that “there are as many Islams as there are situations that sustain it” (Al-Azmeh 2009: 1). Others even suggest that the “ ‘Muslim world” - like el-Zein’s Islam - has never existed and “the construction of the Muslim world was a product of Muslim subjecthood under empire and a means to criticize European racism” (Aydin 2017: 131).

[101] Schulze’s “classicism” might be seen as one of his polemical approaches to Islam and European history - in much the same way as he elsewhere used the term “Islamic Enlightenment” for the seventeenth century (Evstatiev 2013: 9-10).

[102] Although Salafis and their pre-modern predecessors have not been immune to literalism, as traditionalists in matters of theology they have, in fact, insistently privileged the bi-la kayfa (“without asking how”) formula. For further details on literalist inclinations among traditionalists, see Holtzman (2018: 267).

[103] For an overview, see Abrahamov 2016.

[104] Not to be confused with the modern Ahl i-Hadith movement (Metcalf 1982: 264-96), which gained momentum in India from the mid-nineteenth century onwards to oppose the local Sufi and Hanafi traditions and by linking up with the Wahhabis from Arabia (Commins 2006: 145).

[105] The ninth-century traditionalists preferred to call themselves simply ahl al-Sunna (followers of the Prophetic Sunna) as do many modern Salafis, including Wahhabis who also self-identify as ahl al-tawhid (people of monotheism) thus emphasizing their strict theological distinction.

[106] It is necessary to distinguish the term usul al-din (sources, or principles of [Islamic] religion; traditionalist theology) from usul al-fiqh (legal theory). In Islamic jurisprudence (fiqh), legal theory deals with the methodology for retrieving legal norms from the sources (usul) of law (shari'a). Non-traditionalist Sunnis accept four sources of the legal theory - the Qur'an, the Prophetic Sunna (hadith), the communal consensus (jma'), and the analogy (qiyas) - approached depending on the concrete legal school (madhhab). As a discipline, usulal-fiqh correlates withJuru'al-fiqh (positive law) (Schacht 1964: 59-62).

[107] With slight variations, the Salafis found the proof-text (dalil) for such a view in the following hadith: "The best among people (khayr al-nas) are those who belong to my generation (qarni), then those who come after them (thumma l-ladhina yalunahum) and then those who come after them (thumma l-ladhina yalunahum)" (al-Bukhari, hadith No36511897; cf. Muslim No2534).

[108] For an earlier use of the term "proto-Salafi" adopted here as designating the historical trajectory of what is known today as Salafism, see Brown (2015: 118n.3).

[109] Shirk is considered the greatest sin in the Muslim religion, that is to say it is a crime, for which Islamic law ascribes appropriate punishments.

[110] This is about the traditionalist alternative to understanding foundational texts, as in Qur'an 33: 21; 42: 10-11; 38: 75; 67: 1; 54: 14; 32: 4, which mention attributes like God's "hand" (yad), His "face" (wajh) or "ascension to the throne" (istawa 'ala l-'arsh).

[111] From Arabic kharaja - to move out, secede. The Kharijites were "those who went out" or - figuratively - "those who rebelled," for they seceded from the camp of 'Ali, who had been elected caliph after 'Uthman's murder. The reason for this was that during the Battle of Siffin (36/657), the forces of the elected caliph got the upper hand over the Syrians led by the Ummayad caliph Mu'awiya b. Abi Sufyan (r. 41-60/661-680), but 'Ali nevertheless agreed to the arbitration suggested by his opponents, thus - according to the

Kharijites - contradicting God’s judgement (hukm Allah). Gradually, the name Kharijites started to denote not only the historical khawarij who protested against ‘Uthman and ‘Ali alike, but also anyone who rebelled against a leader or his representatives. For an overview of the historical khawarij and their role in the discourses on modern Muslim political activism (Islamism) in the Middle East, see Kenney (2006: 19-53).

[112] “People of the Sunna and the community” is the common conventional designation of Sunni Muslims in the Arabic language.

[113] For a synthesizing overview of this trajectory in the history of Islamic theology, see Rudolph (2016:280-94).

[114] See also Ibn Maja, hadith No6 where those who belong to the group are defined in the very text (matn) of the tradition as “victorious” (mansurin).

[115] On activism and quietism in Islam, see Cook (1981: 15-23); cf. Lewis (1986: 141-47). On the ambiguities and incoherence of the dichotomy between activism and quietism, see Abou El Fadl (2001: 4, 30).

[116] Or wali al-waqt (ruler of the time). On the legitimacy of the notion that under some conditions Muslims can tolerate a certain amount of immoral behavior in the ruler, see Crone, (228-32). For a discussion of the archetypal attitudes towards political authority, including as embedded in the traditionalist teachings of Ibn Hanbal, see Zaman (1997: 114-8).

[117] Lav (2012: 9) distinguishes “quietist” from “radical” Salafis; cf. Wagemakers (2012: 9).

[118] This category is sometimes referred to as “Scholastic Salafism” (al-sala fyya al-'ilmiyya) (Haykel 2009: 49).

[119] This was particularly due to the practice of apprenticeships, still rarely used in France, promoting a match between job supply and demand.

[120] Anis Amri’s rantings on the impious societies of Europe are reminiscent of the texts of the sermons given in the Al Quds mosque in Hamburg by Moroccan preacher Mohamed Fizazi in 2001, which many of the 9/11 terrorists attended, including the Egyptian Mohamed

Atta and the Lebanese Ziad Jarrah, members of the so-called Hamburg cell. This underscores the early establishment of contemporary jihadism on German territory. In 2003, on the basis of the legislation then in force, the Hamburg court ruled that this cell was not strictly speaking a terrorist organization. Yet, in 2007, the Moroccan Mounir al Moutassadeq was sentenced to fifteen years' imprisonment for belonging to it, and the authorities finally closed the Al Quds mosque in 2010. See my commentary on Romuald Karmakar's film, Hamburger Lektionen (Kepel 2013).

[121] This analysis also misses another key point of context. This is that the emergence of Red Brigades and Red Army Factions in both Italian and German society also reflected the coming-of-age of the children of the generation that bore the weight of the engagement with fascism and Nazism. Beyond the ultra-leftist vocabulary used at the time, the murderous violence of the Red Brigadists and Baader Gang also reflects in this sense the symbolic murder of the morally guilty father of the 1930s and 1940s (see Roy 2016).

[122] Even if the two phenomena are not comparable in themselves.

[123] The extreme right-wing movement Pegida used the New Year's Eve attacks, which sparked a number of accusatory polemics against police services for underestimating the phenomenon and thus causing an upward reassessment of the number of victims, to aid its political recovery. This is indicated in the group's unabbreviated name, Patriotische Europaer gegen die Islamisierung des Abendlandes (Patriotic Europeans against the Islamization of the West), which is an expression par excellence of the ethno-cultural divide that is the subject of this chapter. Founded in Dresden in 2014, the movement gained momentum in early 2016 and, in addition to demonstrations, has helped instigate increased attacks on migrants and refugees. Its leader, a former thief who had occasionally appeared dressed as Adolf Hitler, was convicted for racial insults and banned from leading or participating in demonstrations in Dresden for five years.

[124] The PVE secured second place in the election with 20 parliamentary seats (out of 133).

*** [Epigraph]

For this book to be worthwhile, it is not necessary in my view that it should be assumed to embody the truth for years to come and with regard to the tiniest details. I shall be satisfied if it is credited with the modest achievement of having left a difficult problem in a rather less unsatisfactory state than it was before.

** Note on Transliteration

Most Arabic words, even those which occur in written, classical Arabic, are transliterated as they are pronounced in the spoken Arabic of the region in which I worked. The text would have been unnecessarily complicated had I followed separate conventions for the spoken and written variants. For example, Boujad, the town in which I worked, is spoken as Bja‘d. written as Abu I-J ad. The word for “marabout” is mrabet in western Morocco, murabit in classical Arabic. In any case, specialists will easily be able to reconstitute the classical forms. There are exceptions to strict transliteration, primarily of words and place names that have fairly conventional European forms. Also, I have represented most words only in the singular, with plurals indicated by -5. The exceptions to this convention, like the others, are meant to make my text read as smoothly as possible. Plurals that commonly occur in Islamic literature in western languages (e.g., ‘ulama) have been kept intact. Similarly, descendants of the marabout Sidi Mhammed Sherqi, who figure largely in my discussion, are called Sherqawi in the masculine singular, Sherqawa in the plural. I have also found it easier to call a resident of Boujad a Boujadi, as he is called in Arabic, than to resort to awkward circumlocutions.

I have preferred Richard S. Harrell’s system for transliterating Moroccan Arabic vowels (Harrell, ed. 1966:xiii-xix) for two reasons. First, it is more accurate than the system of the International Congress of Orientalists (ICO), designed primarily for classical Arabic. Second, Harrell’s system contains the publishing advantage of eliminating the macron for long vowels. There are six vowels: e, very short but like the e in English masses; o, very short but like the u of put; a, usually like the a of mad; a, a shorter version of a; L exactly as in French vite; u, like the ou in French fou. The ICO system has, however, been retained for consonants, since it is more widely known.

Fifteen out of thirty-one Moroccan Arabic consonants are almost identical with those which occur in English. The others are listed below:

a glottal stop, like the tt in Brooklynese bottle b, Z, m, r, s, t, z: emphatic consonants q: similar to k but pronounced farther back in the mouth kh\ the same as the ch of German Bach

gh: described by Harrell as “similar to a light gargle accompanied by a musical buzz from the adam’s apple” (Harrell, ed. 1966:xvii)

h: “similar to an English ‘h’ pronounced in a loud stage whisper” (ibid.)

c: the Arabic ‘ayn, technically a pharyngeal fricative, with no equivalent in a European language

Z: like the I in French louche r : like the r in Spanish para

** Preface

The fieldwork on which this study is based was conducted in Boujad, Morocco, and its environs between October 1968 and June 1970. Boujad’s significance lies in its continuing domination by the Sherqawi religious lodge (zawya) located there, which makes it perhaps the most important pilgrimage center on Morocco’s western plains. I consider neither the Sherqawi religious lodge nor Boujad as a microcosm of any larger entity. They are merely the loci of an intensive social anthropological study of popular Islam which I conducted there. The data collected there merely form the evidential base for a series of hypotheses about what Clifford Geertz has called “the curve of social discourse” (1973).

In one sense this study is an ethnography and follows the canons of such a study. I do not intend it as just another narrowly circumscribed, brick-laid-on-brick ethnography. Meaningful work in any social science must be based upon the concrete and the specific, but I doubt whether most readers of this book will be motivated primarily by a desire to learn more about Boujad, the Sherqawa, or perhaps even North Africa. The intensive microsociological study I present here is meant to serve as a base for discussion of key traditional Moroccan conceptions of the social order and of the problems of providing an adequate description of religion in a complex Islamic society. In the course of the work, I implicitly present my own vision of the nature of social anthropology and its relation with history, which I consider to be its sister discipline. It is these issues that initially motivated and have continued to sustain this study.

Retrospectively, it appears that the study of a pilgrimage center has probably placed the outline of religious belief and ritual in bolder relief than would have been possible elsewhere. The relatively heterogeneous population of this center and the availability of rich manuscript and oral historical data provided a more solid substance to the “curve” of religious discourse over the last century than I could have expected from most other vantage points. I say that these advantages appeared retrospectively because during a large part of my early fieldwork the difficulties of studying a place with such religious significance were much more vividly apparent to me. Boujad is an important pilgrimage center in an implicit popular pattern of Islam that is in many respects incongruent with the formal tenets of Islam. Both Boujadi-s and tribesmen were quite aware of this and often were quite reserved with the inquisitive “Roman” (rumi) writer who evinced such an avid interest in the town and its religious practices. A Boujad merchant who in his youth had studied the traditional religious sciences (and who later became a leading local nationalist) told me that he had once written a newspaper article characterizing Boujad as namsi. a subtle Arabic term which indicates someone or something evasive, secretive, elusive, and, if need be, wily. Namsi was to him and to most

Boujadi-s a positive quality, a fact which I discovered only gradually, as my perceptions of the social world about me assumed a meaningful pattern. I appreciate the combination of sincere hospitality and discretion with which Boujadi-s initially welcomed me all the more for the trust and confidence which I was eventually accorded.

Many individuals in Morocco and elsewhere have contributed to this study. Many Boujadi-s and Sherqawa have preferred to remain anonymous, but this in no way lessens my gratitude to them. The qadi of Boujad during much of my stay was Hajj ʻAbd er-Rahman 1-Mansuri, a rare exemplar of the distinguished tradition of the religious sciences in Islam. After almost a year of my fieldwork he tacitly decided that, however curious my research techniques and goals might be, they constituted a “science” in their own right. Consequently he offered me sustained intellectual and practical support, particularly in bringing his legal and scholarly training to bear on criticizing and furthering my interpretation of manuscript historical sources. I alone am responsible for the result, but my work would have been greatly handicapped without his interest in it.

Claude Ecorcheville, a controleur civil of Boujad during the 1930’s, allowed me to consult his collection of transcribed royal proclamations relating to Boujad and an account of Boujad’s history which he prepared in 1938. These have been of great value to me in the present work. Mohammed Cherkaoui (Sherqawi) has also been kind enough to speak with me at length on the history of the Sherqawa.

The Moroccan Department of Urbanism and Housing, part of the Ministry of the Interior during my initial fieldwork and now a separate ministry, actively facilitated my work at every stage. To its officials and to others at the provincial and local levels of government I owe my sincere thanks.

One of the intellectual pleasures of working in North Africa and the Middle East is the interdisciplinary, international collegiality that characterizes most area specialists. I found this the case from my student days at the Institute of Islamic Studies at McGill University through those at the University of Chicago. I was particularly fortunate to be at Chicago during a period of sustained faculty and student interest in Islam and the Middle East in the Department of Anthropology. Clifford Geertz, Lloyd A. Fallers, Robert McC. Adams, and Nur Yalman were then all on the faculty. Through both formal and informal seminars, Cliff quietly but vigorously insisted that each of us develop individually a style of thought and analysis. Especially since several of us were working in the same region and freely exchanging ideas, it would have been easy to lapse into a “school.” Cliff delicately managed to convey his own rigorous standard of scholarship without “guiding” me. This has been the case from our first discussions to his reading the penultimate version of this book. I am deeply grateful. Hildred Geertz and Lawrence Rosen were active participants in the Moroccan discussion group that Cliff initiated in 1968, and both have commented on the manuscript of this book. To a certain extent all of us have been concerned with similar issues, particularly the ideas concerning social structure that I develop in Chapters 4 and 5. Our concern has been not so much with “owning” ideas as with testing them on each other. Rosen particularly has discussed his ideas with me at length; I am pleased to work with such open colleagues.

This manuscript was essentially completed in June 1974, a month before the tragic death of Lloyd A. Fallers. I regret that he never got to read it, because many of the interpretations of my material were developed through extended dialogues that began in 1970 and continued until a few weeks before his death. In 1973–1974 he invited me to return to

Chicago as a Fellow of the Committee for the Comparative Study of New Nations and of the Center for Middle Eastern Studies. I hope that in some small way this book merits his confidence in me. Robert McC. Adams has also served for years as a skeptical devil's advocate. His ruthlessly constructive criticisms have been invaluable.

T. O. Beidelman, my colleague at New York University, patiently read several versions of this manuscript with the same critical intensity that he applies to his own work. Our many hours of discussion over the entire field of anthropology have been a major formative influence on me. Nicholas Hopkins of New York University, Ross Dunn of the California State University, San Diego, Robert and Elizabeth Fernea of the University of Texas at Austin, and Jacques Berque of the College de France have also provided generous and incisive comments. For helpful discussions I wish to thank Kenneth Brown, Edmund Burke III, Jacques Cagne, Ernest Gellner, Mohammed Guessous, David Hart, Abdelkebir Khatibi, Ira Lapidus, Remy Leveau, John Middleton, and Abdulhamid el-Zein. John Kirchner prepared the base for all the maps except Figure 3. Bouzekri Draioui of the University Muhammed V checked the accuracy of the transliteration. The book is dedicated to my wife, who has lived with it and shaped it since its inception.

My initial fieldwork was supported by the Foreign Area Fellowship Program and the National Institute of Mental Health. Additional work in Morocco, although not primarily in Boujad, was made possible in the summer of 1972 by the Smithsonian Foreign Currency Program and the following summer by the Social Science Research Council. An earlier version of the first half of Chapter 4 originally appeared in the International Journal of Middle East Studies 5 (1974).

** Introduction

This is a study of Islam as it is locally received and understood in a regional pilgrimage center of western Morocco. I am particularly interested in describing and analyzing the processes by which religious symbols and institutions are reinterpreted and modified to accommodate new and evolving social and historical realities. I am also concerned with describing how religious ideologies, implicit or explicit, themselves shape the social order.

I have attempted to portray certain aspects of a particular culture and society through time. Patterns of belief and ritual, like all systems of meaning, are maintained by persons in the course of social action. As Max Weber was concerned to demonstrate by his empirical studies of the major world religious traditions (e.g., Weber 1952), beliefs and ritual action are often invested with new meanings or change direction as they are introduced in novel situations and social frameworks different from those in which they were initially developed. For this reason, ideas and systems of ideas, especially those which fundamentally shape men's attitudes toward the world and their conduct in it, cannot be analytically construed as ahistorical Platonic entities, unaffected by the ravages of time. They are in a constant tension with social reality, shaping it and in turn being shaped. My intention, however, is not to write social history, although I think this study serves to document Marshall Hodgson's claim that the so-called "folk" culture of Islam shares substantially the same dynamic force that he found more visible in Islam's "high" culture (1975:1,80). My primary goal is to make sociological sense of the changing forms in which

certain key, contradictory elements of a major religious tradition have been understood in a specific locale over the last century.

Some anthropologists might consider the above objective primarily ethnographic, informed by theory but not devoted to it. I think that would be a mistake. My presentation implicitly explores the utility of what might be called a “Weberian” paradigm for the study of social and cultural change and as such constitutes a marked departure from many anthropological treatments of these topics. As Stephen Toulmin writes, anthropology and sociology, among other fields, have recently experienced a sudden transition of their dominant paradigms. For over half a century, both fields had been dominated by a theoretical preoccupation with static, ahistorical patterns and procedures (1971: 53–54, 56). Problems of historical change were relegated to second place or even considered outside the scope of “science.” For example, Talcott Parsons has argued that a synchronic, or functional, understanding of social systems has to precede a diachronic understanding (1964:480). His reason for this is that a comprehensive sociological theory must seek logical “closure,” attainable only if society is treated abstractly and as if it were in an equilibrium. To Parsons, Weber’s lack of concern for such closure in his own writings constituted his “failure” (introduction to Weber 1964:20–25)[1] Other social scientists have gone so far as to insist that sociological abstractions can be made only from ahistorical studies. They argue that, since processes of historical change are particularistic and nonrecurrent, they fall outside the domain of sociological abstraction (e.g., Devons and Gluckman 1964:159–160, 201). A less extreme variation on this argument has been to deal with historical change in synchronic form by juxtaposing several earlier and later descriptions of a single culture or society. The limitation of this strategy is that it serves more to contrast the end points of certain processes than to focus on the nature of the changes taking place. This encourages a conception of historical change in terms of discrete, episodic units, rather than as a continuous process.

There is an increasing awareness of the limitation of ahistorical paradigms for the study of diachronic processes, but it would be a mistake to look, as a consequence, for exclusively diachronic ones. There is no reason to assume a radical dichotomy between stringent historical nominalism and the use of sociological ideal types. Both historians and social scientists continuously interweave the two approaches in the narratives and explanations which they present. This study will try to document empirically the lack of an inherent contradiction between attempts to explain specific events and attempts to seek to confirm recurrent regularities.

Perhaps the clearest illustration of the sociological explanation of specific historical situations remains the paradigm implicit in Max Weber’s The Protestant Ethic and the Spirit of Capitalism. Leaving aside the empirical accuracy of Weber’s argument, his basic problem focuses on a historically unique phenomenon, the emergence of what he calls “rational” capitalism in the West. He seeks to explain this in general, systemic terms by relating developments in the economic order to a particular religious ethos (Weber 1958:25, 166). Weber carefully specifies that the core of his argument concerns the dialectical interrelation of these two elements; but he does not postulate a sequence of unidirectional causation between them (1958:182–183). Weber was simply interested in showing that the two variables, as logically delimited, were in significant tension with each other. He did not seek to validate his thesis by presenting these two elements in a logically closed system. This lack of logical “functional” closure makes Weber’s style of sociology amenable to the analysis of specific historical situations. It also has the advantage of lending itself more easily to a conceptualization of sociological variables over time than the style of argument in which the historical dimension is presented only in superimposed synchronic layers.

The usefulness of such a paradigm for the study of society must be tested not by its pretensions to logical “closure” but by its capacity to provide the best available explanation —consistent, plausible, and in accord with all the evidence—for the problem at hand. This goal is both realistic and attainable if one assumes, as I do, that events in the social world always contain unpredictable and accidental elements and that any paradigm for the study of society must somehow take account of these elements in order to offer an adequate comprehension of social action. The compelling advantage of the Weberian paradigm over other approaches (such as those assuming historical “laws”) is its capacity to achieve a more comprehensive understanding of the sociological features of particular historical developments. The purpose of comparative studies within such an approach is not the gossamer pursuit of general “laws” of history or society but the sharper understanding of particular historical situations and the social forces at work in them. I shall return to these issues throughout my discussion.

I realize that the questions that I raise regarding the nature of religious change in a complex society are difficult and capable of no easy answer. At times my discussion becomes necessarily tentative, and, in fairness to the reader, I will point out such instances as they occur. I have preferred this course to that of sacrificing what I feel are significant issues for less crucial ones that lend themselves to at least a surface elegance or a “neat” representation within more conventional explanatory paradigms used by anthropologists. Similarly, my argument is occasionally more detailed ethnographically and historically than may appear immediately necessary for my implicit theoretical argument. This is deliberate. The main features of North African Islam have often been taken for granted or otherwise misrepresented in much of the literature on the region. A fuller presentation, such as I have attempted here, at least permits the reader to check some of my more abstract conclusions and to discern other possible analytical implications than those which I have chosen to emphasize.

The fieldwork on which this book is based was conducted in Boujad, a town of eighteen thousand people (est. 1970), and its tribal and religious hinterland (see Fig. 1). The town’s significance lies in its continuing dominance by the Sherqawi religious lodge (zawya) located there, which was founded in the late sixteenth century by the marabout Sidi Mhammed Sherqi (d. 1601). Roughly one-third of the town’s population claims descent from him. Collectively, his descendants are called the Sherqawa. The powers attributed to them and certain of their enshrined ancestors form the magnet that attracts pilgrims from throughout western Morocco.

The most striking feature of North African Islam is the presence of marabouts, such as Sidi Mhammed Sherqi. They are persons, living or dead,[2] to whom is attributed a special relation toward God which makes them particularly well placed to serve as intermediaries with the supernatural and to communicate God’s grace (baraka) to their clients. On the basis of this conception, marabouts in the past have played key religious, political, and economic roles in North African society, particularly in Morocco. Until the end of the nineteenth century, maraboutism was virtually without contest the prevailing form of rural and urban Islam throughout North Africa (Merad 1967:58). The complex of beliefs surrounding marabouts was—and for many North Africans continues to be (although in significantly modified forms, as will become clear)—a central and integral element in a coherent vision both of the realities of the social world and of man’s relations to the supernatural.[3] A concrete indication of this is the proliferation of maraboutic shrines throughout the Maghreb, particularly in Morocco. In Morocco’s rural areas, one rarely loses sight of the squat, whitewashed, and—in the case of the more popular ones—domed maraboutic shrines. In towns, more lavish shrines with green-tiled roofs are often found,

with vast courtyards and adjoining mosques and hostels for pilgrims. The shrine of Sidi Mhammed Sherqi takes this form, as do those of several of his descendants that are also situated in Boujad.

Tens of thousands of pilgrims, singly and in groups, visit these shrines throughout the year. The greatest influx is during the annual festival (musem) of Sidi Mhammed Sherqi, held in late September or early October. For a two-week interval, the town doubles in size, as client groups, each of which stays an average of three days, renew their covenants with the Sherqawa. At other times of the year, the descendants of marabouts go out to their clients and say invocations on their behalf in exchange for customary offerings. In all, the activities associated with marabouts are impressive. Few others so thoroughly involve the active participation of the majority of the region's rural population and activate social ties that transcend ordinary economic, social, and administrative boundaries. This fact is not lost upon government officials, despite their formal assertion that maraboutism constitutes an atavistic ideological residue of the least "evolved" segment of the population. Seventy percent of the country's population was rural as of 1970 (as opposed to an estimated 93 percent in 1900) (Noin 1970:11, 100) and, as I shall indicate below, it is reasonable to assume that the majority of the rural population supports maraboutic activities in some form. In the past much of the urban population also supported such activities.

In this study I am not trying to generalize directly from Boujad to any larger entity. I consider neither the Sherqawi religious lodge nor Boujad as a microcosm of a larger whole. The study of such a pilgrimage center as Boujad undoubtedly places the outline of religious belief and ritual in bolder relief than would have been possible elsewhere. Moreover, manuscript and oral historical sources, both French and Moroccan, were available for Boujad. These were invaluable for tracing the curve of religious understandings and transformations of religious institutions over the last century, especially through the turbulent years that immediately preceded the French protectorate in 1912. Boujad's role as a "company town" for the descendants of Sidi Mhammed Sherqi notwithstanding, the activities of its population are heterogeneous, as would be expected in a regional market center, which the town also is. There are no more full-time religious specialists in Boujad than in other towns of commensurate size. What is important is that roughly the same range of coexisting understandings of Islam is found in Boujad as elsewhere in Morocco, although there is considerable variation in the pattern of religiously oriented activities or institutions.

[[d-f-dale-f-eickelman-moroccan-islam-17.jpg]]

[[d-f-dale-f-eickelman-moroccan-islam-16.jpg][Figure 1. Morocco.]]

Understanding the character of Islam in Boujad, particularly the role of marabouts and its temporal transformations, goes in one key sense beyond its ethnographic importance for a particular region of Morocco or even North Africa. Figures similar to marabouts, ambiguously and often misleadingly labeled as saints, Sufi-s (mystics), or holy men, exist throughout the Islamic world. This is not to say that they all play similar social or cultural roles. They decidedly do not. But everywhere they popularly represent an implicitly

hierarchical conception of the relations between man and God.

Their supporters see marabouts and similar “holy men” as a hierarchy of intermediaries through whom the supernatural pervades, sustains, and affects the universe. Analytically, an observer may hold such a conception of access to the divine to be, in Weber’s sense of the term, a “magical” accretion to Islam; but from the viewpoint of tribesmen, peasants, and others who hold such beliefs and act upon them, intermediaries with God are part of Islam as they understand it. Supporters of this conception do not in general systematically articulate their beliefs, but they certainly would reject the notion that they are an amalgam of Islamic and non-Islamic elements. They regard themselves as Muslims, pure and simple. In what sense, then, can such beliefs be considered to form a part of Islam?

Ernst Troeltsch (1960) posed a similar question of the Christian tradition. He argued that, sociologically, Christianity could be seen as constantly in tension with social reality. Consequently, its sociological history is one of shifts at various levels between compromise and noncompromise with the world. A similar pattern can be seen in Islam. Maraboutic assumptions about the relations between man and God (and similar assumptions elsewhere in the Muslim world) are diametrically opposed to what most contemporary educated Muslims consider to be the “scripturalist” core of Islamic belief and ritual, but at the same time bear closer relation to the existing framework of social relations. Let me briefly, perhaps too abstractly, outline these opposed assumptions. Scripturalists and Islamic modernists assume that all men, including the Prophet Muhammed, are considered equals before God, even if they are not so in the eyes of each other. They also assume that there is no human or nonhuman hierarchy that has privileged access to God. There are supernatural beings besides God—angels, jinn-s, Satan, and saints (wali-s\ but none of these serve as intermediaries. These assumptions are explicit in the Qur’an and in the teachings of numerous reformist movements which have been an integral part of the Islamic tradition since the time of the Prophet (Merad 1967:29; Rahman 1968:245). These “formal” doctrinal tenets have been aggressively propagated by an articulate, reformist elite in recent decades (and periodically in the past— the first “reform” movements began not long after the death of Muhammed) and have had a decided impact upon popular belief, especially with the spread of “modern,” city-oriented life-styles. Characterizing these beliefs as “formal” Islam is not entirely satisfactory, but it reflects their emphasis upon the equality of men before God and the fact that most educated, articulate Muslims now adhere to these interpretations of Islam rather than to any others.

Those who remain in client relations with marabouts and their descendants are aware of the disfavor with which their beliefs are viewed by educated Muslims. For this reason, maraboutic beliefs and rituals are often denied before outsiders or dissimulated in favor of the formal tenets of Islam. Still, maraboutic beliefs are tenaciously seen by the clients of marabouts to be the way things really are in the relations between man and God.

Unfortunately, the hierarchical assumptions implicit in much of popular Islam are largely unrecorded and poorly understood. Relatively few studies of Islam have ventured beyond the presentation and analysis of written texts and the explicit ideologies of an articulate religious intelligentsia. In contrast to various reformist movements that have explicit ideologies and representatives willing to discuss them, little attention has been given to the description and analysis of popular, “traditional” beliefs and their social context (Merad 1967). The works of Jacques Berque and, more recently, Clifford Geertz constitute singular exceptions to this neglect. Most reformist Muslims and scholars of Islam typically attribute the continuing strength of traditional, maraboutic beliefs to an ignorance of “true” Islam on the part of many Muslims both now and in the past. Such “ignorant” persons are thus,

according to reformists, at the mercy of charlatans, parasites, opportunists, and other varieties of “spiritual delinquents” (Rahman 1968:185).

At least for North Africa, such accounts of the persistence of marabouts are exceedingly unconvincing. As I discovered early in my fieldwork, the supporters of marabouts are fully aware, at least in outline, of the interpretations of Islam offered by the scripturalists; yet they continue to regard maraboutic Islam as a meaningful religious representation of reality.

What then, are the implications of the coexistence of these antithetical notions of Islam? I think it is useful to anticipate part of my argument. In the Islamic tradition as it has emerged in various parts of the world, the conceptions of man’s relations to God as comprising or lacking intermediaries are correlative rather than mutually exclusive and are in a dialectical tension with each other and with social reality. Both now and in the past, these conceptions have been known at least in bold outline to all believers. Taken together in various syntheses according to temporal and social contexts, these two conceptions have enabled Islam to encompass many varieties of social experience and to be regarded at any given time as a meaningful religious representation of reality. I believe that the proper study of any world religious tradition involves understanding its variants over time and place and their interrelation. The career of maraboutism and of marabouts in Boujad provides a concrete instance of how a world religion has remained living and meaningful to those who sustain it.

The order of presentation of this study is somewhat unorthodox for an anthropological monograph. In order to make my discussion of the relation of religious ideologies to society as clear as possible, I have found it convenient not to follow a strictly historical progression. In any case, Boujadi-s themselves have multiple conceptions of the past which they often invoke with varying degrees of consciousness to facilitate their comprehension of social action. My own shifting between past and present has much the same intention. Only the first two chapters are ordered in strict chronology. Chapter 1 outlines in a very general way the implantation and early development of Islam in Morocco. In large part it is meant to orient readers unfamiliar with North Africa. lam particularly concerned with the fourteenth through the sixteenth centuries, the so-called Maraboutic Crisis, during which maraboutic Islam gained hegemony. In a sense, the “filling out” of maraboutic Islam that occurred during this period is the inverse process to the chief concern of this book, the loosening hold of that same pattern over the last century. Although both Moroccan and foreign historians have been attracted to the analysis of this period, the social bases of maraboutism are generally assumed rather than described. Since traditional chronicles present only those aspects of maraboutism congruent with the formal tenets of Islam, this is not surprising. I try to correct some of these lacunae in my ensuing discussion of the preprotectorate history and sociological characteristics of the Sherqawi religious lodge in Chapter 2. Because precolonial sources for the political activities of marabouts are almost nonexistent, I discuss my sources in detail in an appendix.

The next major section of the book, Chapters 3–5, presents the economic activities and social institutions of Boujad and its rural hinterland, their social structure, and some of the basic common-sense assumptions that Boujadi-s and tribesmen make about the social order. These are not just “contextual” chapters prefacing the intensive discussion of maraboutism and the changing local consciousness of Islam, the subject of the final three chapters. Of course, maraboutism as an implicit, unarticulated pattern of belief and ritual action has derived much of its strength from a congruence with the values that guide everyday conduct. Such congruences have hardly gone unreported in the classic

monographs of social anthropology. But these congruences are neither total nor permanent. For this reason, of perhaps greater interest are those situations, both now and in the preprotectorate past, in which such congruences have been denied or questioned, and which have led to shifts in patterns of belief and ritual and, equally, to altered conceptions of the social order.

** 1. Morocco, Islam, and the Maraboutic Crisis

*** The Geographical Background

Of all the countries of North Africa, Morocco shows the most marked ecological diversity. In the Middle East as a whole, perhaps only Iraq shows a similar range of variation, although Morocco does not share the latter country's sharp ethnic and religious cleavages. Geographers divide Morocco into twenty-three distinct ecological zones, although these can be grouped into three major regions: the Rif and Atlas mountain chains, the coastal and interior plains situated roughly between Marrakesh and Fes, and the semiarid pre-Sahara of the south (Noin 1970:1,88–89). The first two of these regions show little marked discontinuity with the southern half of Spain, a resemblance complemented by others in traditional rural genres de vie and in the spatial organization of traditional towns.

Except for Marrakesh, Morocco's most important towns and cities are located on the plains to the northwest, especially the Sais, Gharb, and Shawya. This region also has the heaviest rainfall and the richest agricultural land. Consequently, with the exception of certain densely populated pockets of the Rif Mountains, it carries the highest population concentration of the country, roughly sixty persons per square kilometer. This density affords a dramatic contrast to the average of five persons per square kilometer in the arid southeast (Martin et al. 1967:57).

As one proceeds southward from these plains, Morocco becomes progressively more arid. This is especially the case south of the Umm er-Rbi' River. Nevertheless, large parts of these plains have been provided with modern irrigation since the 1930's and thus now form a part of what the French (and by imitation the Spanish, who administered a small northern zone) used to call le Maroc utile ("useful Morocco"), the agriculturally rich and economically exploitable regions that once attracted the major part of colonial settlement and investment. Prior to the protectorate the tribes of these coastal and interior plains were also "useful" to the Makhzen, or central government, in that taxes and other levies could be more regularly exacted from them than from the tribes of other regions. For this reason "useful Morocco" was also known as the "land of the Makhzen" (blad l-Makhzen). The term Makhzen literally means "a place to store treasure." Its popular connotations are obvious. The core of le Maroc inutile from the point of view of colonial economics was the two major mountain chains and the pre-Sahara. These regions also broadly coincided with what colonial ethnographers and Makhzen officials called the "lands of dissidence" (blad es-siba'), zones only sporadically under the control of the Makhzen.

Perhaps the most important ecological features which have affected Morocco's political fortunes are its two mountain chains. In the north, the Rif Mountains impede easy access from the Mediterranean to the interior of the country. To the west and the south, the

Middle and High Atlas mountain chains have been characterized as a “natural barrier” to the rest of the continent. Traditionally, these mountainous regions have offered natural zones of refuge from the Makhzen for the predominantly Berber-speaking tribes that populate them. Some of these tribes are sedentarized; others, even to the present, largely transhumant. Except during intermittent periods when charismatic religious and political leaders emerged to unite them, these tribes have remained relatively fragmented and autonomous. Even France, with the resources of a modern colonial power, took twenty-one years, from 1912 to 1933, to “pacify” all of its possession.

Nonetheless, the importance of these mountains and the lack of natural harbors in isolating Morocco has often been exaggerated. The use of such geographical factors as natural barriers to explain the course of Moroccan history has primarily a metaphorical utility. During most of the Middle Ages of Europe, the fortunes of Morocco were closely linked with those of the Iberian Peninsula; for certain extended periods, the Iberian Peninsula was even ruled from Morocco. From at least the seventeenth through the nineteenth centuries it was less any natural barriers than the policies of its successive rulers which isolated Morocco both from Europe and, to a lesser extent, from the Middle East as well. General Franco, in launching his campaign against Republican Spain from Morocco in 1936 with significant numbers of Riffian tribesmen in his ranks, was only the last of a large number of conquerors to show the permeability of the boundary between North Africa and southern Europe.

Similarly, the Atlas Mountains to the south may have impeded, but in no way cut, communications. From the middle of the ninth through the fourteenth century, most of the gold trade from Black Africa to the Middle East flowed through Morocco. At the end of the nineteenth century there was a significant, if no longer flourishing, trans-Saharan caravan traffic linking sub-Saharan Africa with Marrakesh, Fes, and other major Moroccan cities (Dunn 1971). The remote Tafilalt oasis in Morocco’s southeast, far from being politically peripheral, was strategically situated along one of the major north-south caravan routes and was the birthplace of the ‘Alawi dynasty, which has controlled the Moroccan empire (a kingdom since 1956) from 1666 to the present. The earlier Sa‘adi dynasty (1555–1659) came from the Dra Valley. Both dynasties have based their legitimacy upon patrilineal descent from the Prophet Muhammed.

*** Islam in Morocco: The Early Stages

Islam first came to Morocco in 681 with the raid of the Muslim general ‘Uqba ben Nafi. This lightning expedition, which occurred less than fifty years after the death of the Prophet Muhammed, did not immediately lead to a permanent Arab and Muslim presence. Not much is known of the process of Islamization or the consolidation of Arab hegemony for this period, but they seem to have varied considerably according to tribal and other political divisions of any given region. More certain is that by the middle of the eighth century at least a nominal Islam had been firmly established throughout Morocco, but the systematic Islamization of the Berber-speaking tribes was a slow process which stretched out over the next few centuries and occasionally encountered determined opposition. The fact that some of the resistance was led by prophets claiming revelations in Berber dialects rather than Arabic reflects the formidable linguistic and, to a certain extent, cultural barriers which had to be overcome in the spread of Islam (Brignon et al. 1968:49–57; Bel 1938:166–188; Julien 1972:127–128, 370).

Throughout the early period of Islamization, there was a constant, although often

antagonistic, contact between the autochthonous Berber tribesmen and the Arab conquerors. At first, the cutting edge for the diffusion of Islam was the towns and fortresses (rbat-s) where Arab contingents were stationed. Arabic gradually became the language of the towns and of contact with the garrisons (Bel 1938: 363–365; Brignon et al. 1968:53–62). One of the first Arab dynasties of Morocco, the Idrissi (788–1016), dates from this period. It was founded by Idris I (d. 791), who escaped the massacre of his family in the Muslim Orient and fled to Morocco. As a claimed descendant of the Prophet Muhammed, he was enthusiastically received and supported by certain Berber tribes. The reign (803-828/829) of his successor, Idris II, a son by a Berber concubine, marked the beginning of an effective government, although essentially confined to the plains between the Rif and Middle Atlas mountains, and of a more profound and systematic Islamization of the Berber tribes.

Although from the ninth century onward the interaction of townsmen and tribesmen in Morocco was continuous and intense, it would be an error to reduce this to a simple manifestation of Arab-Berber conflict, or of mutually impermeable urban and tribal life-styles. As Clifford Geertz has pointed out, Morocco is at the frontier of the grain-growing world and developed no stable buffer of peasants between the cities and tribes as occurred elsewhere (1968:5–7). Colonial historiographers often portrayed Morocco's towns and cities as foreign bodies in a vast sea of tribesmen. But from the advent of the Muslim conquest they progressively became and remained very much interdependent economically with their rural hinterlands and involved in the same range of political activities. Only since the onset of the protectorate has the gap between the two again widened.

The fluid interpenetration of towns with tribal areas is particularly salient in the period 1050–1450, characterized as the Great Age of Berber Islam and the formative period of Morocco as a nation. In contrast with the superficial Islamization accomplished by the first wave of Muslim conquerors, in this period it was Berber tribesmen who enhanced Islam as a symbol of Moroccan identity. Both the Almoravid (1061–1147) and Almohad (1130–1269) dynasties were founded and consolidated by charismatic Berber leaders who, to use Geertz's striking phrase, combined "strong-man politics with holyman piety" (1968:8). They managed to fuse Berber tribes into effective political forces and incorporate towns and, for significant periods, even much of the Iberian Peninsula into their empires. For religious reasons both dynasties provided an impetus for Arabization. Moreover, a second influx of Arab tribal migrations in the eleventh century, the so-called Hilali Invasion of colonial historians, led to a further erosion of distinctions between Berber and Arabic-speaking tribes. This further strengthened the political base of these dynasties and contributed to the formation of a distinct Moroccan identity.

By the fifteenth century, however, the unifying ideology which sustained these two dynasties was exhausted and the political order which they forged had collapsed. It was in the period of intense ideological and political dislocation which followed, the Maraboutic Crisis, that Morocco developed a distinct style of polity and of religious expression which was to persist largely intact until the early part of this century.

*** The Maraboutic Crisis and Its Assessment

The Maraboutic Crisis lasted roughly from the fifteenth to the end of the seventeenth century. Its beginning was not sharply marked by any one event but rather by the constellation of several historical developments. As the Almoravid and Almohad dynasties declined, they were followed by that of the Merinids (1146–1546). This dynasty, in turn,

eased into a period of prolonged decline. A major economic factor contributing to this political weakness was Morocco's diminished control of the lucrative trans-Saharan gold trade with the development of alternate routes. Further, Spanish and Portuguese "crusaders" had established enclaves along Morocco's coasts. The Merinids had constantly to compromise with them and with the Christian powers of southern Europe. Many of the dynasty's subjects criticized it for yielding unnecessarily to Christian demands. The Ottomans in Algeria, who were not under direct pressure from Christian powers, played on this sentiment and exacerbated the difficulties of the Moroccan dynasty by supporting opposition to it.

In this same general period, Berber tribesmen from the extreme south of Morocco began a vast movement into the central regions and plains which was to continue over the next few centuries. The overall effect was to create a period of prolonged civil and dynastic strife (Burke 1969:70–75; Bel 1938:376–400; Lacoste 1974). Religious and political authority was open to competition at every level of articulation of society, hard to maintain, and subject to reversal (C. Geertz 1968). Under these conditions the sultanate, rather than being the center of authority and legitimacy, was just one of a number of competing centers of power.

I think it is useful here to specify exactly how a discussion of this period fits into this study. In one sense, that pursued by Geertz in Islam Observed (1968), it is important as the formative period that shaped much of Morocco's prevailing religious and political style for ensuing centuries. This is of interest because, as I have mentioned, it is the inverse of that same style that concerns me here. But the lack of sources that reveal the sociological nature of this period limits its possibilities for a comparative study. Instead, I want to concentrate here upon some of the ways in which this period has been construed historiographically and by contemporary educated Moroccans. This concern brings into sharp focus some of the obstacles to the study of Islam as popularly understood.

One component of understanding any historical action, at least for contemporary social historians, is an effort to see events as they were originally comprehended by participants in them. In reconstructing this aspect of the past, historians are professionally aware of the necessarily arbitrary process of selection and abstraction involved in their work. In other words, the comprehension of historical action involves the observer's consciousness about what is essential in past action interacting with what is known of past events. Consequently, it is possible to have multiple conceptions of the past. Far from being a sterile relativism or the despair of hard-bitten positivists, an attention to these problems of perception enhances the social historian's (and the social anthropologist's) sensitivity toward temporal shifts in cultural understandings prevailing at any given time. This applies to the investigation of the present as much as the past, since the shape of the past and attitudes toward it serve as major elements in defining contemporary social realities.

This has been the case for the Maraboutic Crisis. Despite the general thinness of sources for the period, it has been used by colonial historians and many educated Moroccans in recent decades as a sort of Rorschach protocol for elaborating their conceptions of Moroccan (or, alternatively for some, Muslim) society. Although differing in other respects, both colonial historians and Muslim scripturalists assume that Moroccan culture and society became "frozen" during this period and did not alter in essential form until the protectorate era. For the moment, I want to leave aside the question of the dubious accuracy of this assumption and concentrate upon what the historiography of the Maraboutic Crisis reveals about attitudes toward the popular understanding of Islam.

With the exception of the recent work of Abdallah Laroui (1970), the most elaborate assessment of the Maraboutic Crisis remains that developed by French colonial historians, basing themselves upon historical and ethnographic research conducted in the first part of this century. Such studies were primarily undertaken by individuals directly or indirectly concerned with establishing or maintaining the machinery of the protectorate. Like India for the English, Morocco tended to attract a higher caliber of French personnel than other colonies, so that the work of these scholars remains the starting point for reappraisals of Morocco's past. Or, to be more exact, the "colonial vulgate" is now an inherent part of that past.

Key elements of what the French saw as "traditional," here as in other colonies, were frozen into place to serve as the symbols of legitimacy for the "protecting" power. The French felt that, with their early ethnographic inquiries, often carried out by military intelligence officers, they had ascertained the essential features of le Maroc disparu ("the Morocco that was"), the colonial phrase used to describe Morocco as it presumably was for an indeterminate period prior to the protectorate. The French then formally maintained that their task as "protector" was to preserve and to enhance what they considered to be the positive features of preprotectorate Morocco. As French rule became established, the early ethnographic formulations of the nature of indigenous society tended increasingly to be invoked rather than reassessed in the light of changing conditions. At least in the early part of the protectorate, the French were able to make their view of Moroccan society a significant component of social reality.

French administrators and scholars occasionally described North African society as totally static from the exit of the Romans to the establishment of French control.[4] This state of affairs sometimes was attributed to the impact of Islam (e.g., van Gennep 1914: esp. 157—194) or, alternatively, to the fixed religious conceptions of the indigenous Berber population (e.g., Bel 1938). Lucien Levy-Bruhl's concept of the "primitive mentality" was avidly picked up by colonial specialists on Morocco as a way of theoretically justifying their assumption that Islam had such a grip on society that the minds of Moroccans were collectively stocked with a fixed set of images impermeable to modification or change (Brunot 1923; 1934; Hardy 1926).[5] As late as 1951 a leading French administrator and ethnographer wrote that in Islam "evolution is boundlessly slow. For Islam, even more than for other religions, one has to count not in years but in centuries" (Montagne, foreword to Drague 1951:5; italics added).[6]

Relatively few scholars engaged in the hyperbole of seeing the forms of North African society as fixed from the time of the Romans. But, as I have indicated, most were willing to see the Maraboutic Crisis as the decisive period in which Islamic beliefs and institutions were refashioned so as to be in accord with what were assumed, rather than demonstrated, to be certain "fundamental" notions of the indigenous population of North Africa.

*** The "Fundamental" Beliefs of Barbary

One of the most influential colonial accounts of the religious synthesis which occurred during the Maraboutic Crisis was that of Alfred Bel. Bel was a French orientalist who for many years taught in Algeria and Morocco and who, among other tasks early in the Moroccan protectorate, was responsible for reorganizing the traditional religious teaching at the Qarawiyin Mosque in Fes, which once was one of the great centers of Islamic learning in North Africa. In the 1930's his lectures on Islam, on which his La Religion musulmane en Berberie (1938) is based, were a standard part of the curriculum for

training the protectorate’s native-affairs officers. Jacques Berque has pointed out to me that Bel’s work was out of date by the time it was published. This is undoubtedly the case. But the fact remains that Bel had a prolonged influence on educated colonial officials and others and that better general accounts written for a wider public, such as Henri Terrasse’s Histoire du Maroc (1949–1950), became available only much later.

Bel’s account is particularly interesting because it tries to demonstrate thoroughly the complex interrelation between Moroccan religious beliefs and the political developments of the period which he discusses. His assessment of this interrelation contains obvious distortions, especially in his acceptance of a stratigraphy of religious beliefs and of an image of “true” religion as somehow independent from other aspects of society. Bel nevertheless carefully considers all available documentation.

Bel’s argument is an idealist one. He sees a long-term historical evolution which occasioned a gradual erosion of essential Islamic tenets. This purported trend is the result of his assuming an earlier period when Islamic beliefs were understood and practiced virtually in idealized, pure forms almost exclusively by the Islamicized urban elite of North African society. Almost no explicit sociological context is provided for this period. By adding sociological detail and depicting the understanding of Islamic beliefs in popular milieus for later periods, Bel manages to suggest the decline and compromise of Islam, which he indistinguishably conceives as a “religious faith” and as a civilization.

In many ways the structure of Bel’s study resembles that of Fustel de Coulanges’s The Ancient City. Like earlier commentators on Morocco (e.g., Doutte 1903), Bel presumes a stratigraphic model of the historical development of religion and society. His book begins with an account of what he assumes to be the first known religious practices of North Africa; later chapters deal successively with various periods up to the sixteenth century. A single concluding chapter presents religious beliefs as they presumably have remained over the last four centuries.[7] In this chapter alone, Bel frequently introduces ethnographic materials, but he apologizes for presenting “popular religious fictions” and “pious legends,” since these he considers only a “muddle” of actual historical events in contrast with written accounts (1938:390–400).

In detail, Bel argues that after Islam was first introduced in “Barbary”—the standard colonial term for North Africa prior to and after the Islamic conquest—both its formal rituals and Islamic mysticism (tasawwuf^ Sufism) were understood and practiced primarily by an urban elite. Tribesmen who came to towns to pursue the study of Islam were invariably assimilated into the towns and did not try to carry their knowledge to the countryside (Bel 1938:364–365).

Beginning with the thirteenth century, rural religious lodges (zawya-s) began to complement those already in the towns. The teachings of these lodges tended to emphasize Sufism over other aspects of Islam. The principles and ritual necessary to progress in the stages of the mystic way (jariqa) were a primary concern.[8] Each religious lodge was directed by a Sufi master, called a shaykh. It is indicative of his idealistic assumptions toward his material and an implicit comparison with institutionalized European mysticism that Bel glosses the term shaykh as directeur de conscience (“spiritual director”). Each shaykh had an entourage of disciples; collectively, shaykh-s and their disciples were known as foqra (sg., fqir), a term defined in Sufi texts as “those who have abandoned everything in quest of God.” The foqra of each religious

lodge were materially sustained by gifts and contributions made by the inhabitants of the surrounding region (Bel 1938:352–353).

The spread of zawya-s from the towns to the countryside provoked a fundamental change in the nature of Sufism. Bel writes that the strict rules, the severe rituals, the monotheistic conception of God, and the more subtle aspects of mystic doctrines were incomprehensible to "unpolished, minimally educated" tribal disciples. These were incapable of accurately comprehending the fundamental tenets of Islam. Islam in the countryside thus had to be "reduced" to the understanding of the "vulgar populace" (I'homme du peuple'). The abstract components of Islamic doctrine could not survive in the emerging synthesis of Islamic populism (Bel 1938:355, 369; also see Michaux-Bellaire 1927:4). Religious lodges in tribal areas humbly began as centers to propagate a "correct" understanding of Islamic doctrine and practice, writes Bel, but became increasingly enmeshed in local society and tribal politics. In the political disorders of the fifteenth century and later, the rural population turned increasingly to the religious leaders of these lodges to relieve them of oppressive government, repurchase captives held for ransom by Christian invaders, and alleviate other forms of need or misfortune (Bel 1938: 353).

According to Bel, the main reason that these rural zawya-s were incapable of "raising" the level of understanding of religion was the impermeability of what he calls the "fundamental religion" of the Berbers. Bel admits that the evidence for the nature of these beliefs is negligible or uncertain but says that, as far back as can be traced, Berbers seem to have believed in a mix of good and bad "forces" and in magical techniques of protection against vague, malevolent spirits. For Bel, one proof of the existence and pervasiveness of this religious substratum was the relatively short period of time during which the Almoravid and Almohad ideologies managed to hold sway over the Berber populations. Another indication of these fundamental beliefs for Bel was the rapid and widespread success of vulgarized Sufism, in which Sufi shaykh-s in rural regions were quickly assimilated into the pre-existing religious framework and had attributed to them the ability to convey supernatural blessings, baraka. Bel explains the popularity of this conception as follows: "Does not the idea of the tutelary God of Islam—more powerful than demonic spirits—lead to that by which God can transmit to certain meti, his friends [szc], a part of his power, his baraka? To become one of these men by Sufi exercises, to gather from these human fetishes (hommes fetiches) a parcel of their beneficent influence, which chases and destroys the forces of evil, was a perspective well in accord with everyone's aspirations" (1938:342).

A key element in Bel's presentation of the fusion of various concepts into an Islam compatible with pre-existing "fundamental beliefs" during the Maraboutic Crisis was the increasing significance attached to descendants of the Prophet Muhammed, collectively called shorfa (sg., shrif).

Prior to the fifteenth century the concept of descent from the Prophet and that of maraboutism were largely separate. Gradually, some of the more successful marabouts, such as the Berber mystic al-Jazuli (d. 1465/1466), who was reputed to have had twelve thousand disciples at the time of his death, claimed descent from the Prophet. Increasingly the concepts of maraboutism and descent from Muhammed fused. From the fifteenth century onward, writes Bel, there was an "epidemic" of claims by marabouts of descent from the Prophet. Even the names of many tribes changed during this period to indicate such descent.

Similarly, before the fifteenth century a marabout was “one who is tied to God” and thus was equivalent to a Sufi shaykh. The term also signified the early propagators of Islam, who lived in fortified enclosures (rbat-s—a word derived from the same triliteral root as mrabet, “marabout”). By the fifteenth century, however, the meaning of marabout had significantly shifted. By that time marabouts were regarded as saints (wali-s and saleh-s). It was popularly believed that for temporal success men had to attach themselves to marabouts. who were capable of communicating God’s grace (baraka) to them. In part, this capacity was considered hereditary. A reputation for being a marabout could be based upon varying combinations of descent from the Prophet Muhammed (or from ‘Umar ben 1-Khattab, his second successor, or caliph ^khalifa’, in all but prophetic powers), religious scholarship (7Zm), mystic insight, and the possession of uncanny powers. These attributes were permeable, in that possession of one frequently constituted evidence for the others. Thus, feats of religious scholarship gave one the reputation of being a marabout (e.g., Bel 1938:371). A reputation as a marabout conversely legitimated claims to descent from the Prophet (e.g., Levi-Proven$al 1922:201).

Throughout these developments, Bel writes that the carriers of Islamic learning (‘z’Zm) continued their teaching in the cities, although their scholarship, insulated from contemporary realities and popular acceptance, became increasingly pedantic and fossilized. Marabouts were left to purvey to the masses a “vulgar” mysticism and fatalistic resignation to the world, stripped of the more rigorous aspects of the Islamic tradition. Thus their synthesis of Islamic populism was devoid of a critical spirit. The hegemony of mara- boutism was, nevertheless, to last almost unchallenged until the early twentieth century. It signaled for Bel the general collapse (flechisse- ment) of Muslim civilization in North Africa (1938:369–372, 388).

The political consequences of maraboutism were far-reaching. The Sa‘adi and ‘Alawi dynasties of Morocco both claimed legitimacy on the basis of descent from the Prophet Muhammed. Marabouts helped both of these dynasties to power but at the same time struggled to establish and maintain their own local and regional political autonomy. By the late sixteenth century maraboutism was firmly established as the idiom of political action. Both the Ottomans, in possession of Tlem^en from 1555 and Tunis from 1574, and the Moroccan dynasties increasingly pursued a maraboutic style of politics and associated marabouts with their own political ends in order to maintain popular support of the “Berber” tribal majority. Religious lodges and marabouts claiming ties with the mystic shaykh al-Jazuli predominated in regions allied with the Moroccan dynasties. Those claiming ties with shaykh ‘Abd 1-Qader l-Jilani (d. 1166) were primarily allied with the Ottomans. As mentioned, Moroccan dynasties were compelled to temporize with the Christian powers, while both the Ottomans and marabouts (whether or not they were allied with the Ottomans) were able to call uncompromisingly for holy war (jihad) against the infidels.

Bel writes that, under these circumstances, Morocco found itself “prey” to marabouts who consciously exploited their reputation for sanctity as a conscious device for temporal aggrandizement. Citing approvingly an earlier source, Bel writes that, from the sixteenth century onward, marabouts “under the cover of religion” founded feudal “fiefs” (1938:376–388).[9] Such statements sharply reveal Bel’s implicit assumption of what is “properly” religious. But Bel does seem correct in emphasizing that from at least the sixteenth century to the protectorate there was considerable tension between marabouts and the sultanate. Both marabouts and the sultan shared some of the same bases of popular legitimacy. By formal accounts the sultan (since 1956 the king) is the temporal center of the Moroccan

empire. At the same time, by virtue of descent from the Prophet Muhammed, the sultan is also popularly considered to be the caliph, God's deputy on earth (khalifet Allah fel-l-ard)[10] As such, he is also Morocco's spiritual leader. Since French policy from shortly prior to the protectorate was to support the institution of the sultanate as the basis on which the French presence was legitimized, this doctrine was further elaborated in the early colonial era. But the sultan has a second popular basis of legitimacy that is ambiguously shared with marabouts. This is the possession of divine grace (baraka) and the ability to transmit it. This basis of legitimacy even figured in a proposed Moroccan constitution of 1908.[11]

The tension inherent in this ambiguity is apparent in a royal decree (daher) dated 12 July 1820 / 10 Shawwal 1235,[12] in which Sultan Mulay Sliman invested an eleven-year-old marabout as lord (sid or mqaddem) of the Sherqawi religious lodge. In the decree the boy is told that he inherits the "secret of your ancestors" (sirr aslafikum), that is, the powers of a marabout, and that he is responsible to God alone. There is no explicit mention of the duty of submission to the sultan, presumably because of the marabout's "special" relationship with God. But by investing the boy (and passing over an elder, more mature brother who had spent a considerable period of time in the sultan's entourage), the sultan in effect demonstrated a pragmatic, if not formal, dependency on his will.

Because of this shared basis of legitimacy, the sultanate was limited in its capacity to attack the ideological basis of maraboutism, although individual marabouts were on occasion killed, imprisoned, or exiled when their influence became a threat (e.g., Morsy 1972). Hence, according to Bel, the static nature of Islam and the Moroccan polity over a period of four centuries.

Clearly, some of Bel's assumptions about the nature of religion— Islam in particular—and its relation to other aspects of society have strongly influenced the form of his argument. A key assumption is that "true" religion expresses itself only in institutions independent of other aspects of society. Bel is not concerned with demonstrating that such a conception is held by Muslims themselves. Hence he asserts that the popular religious leaders who emerged during the Maraboutic Crisis merely used religion as a "cover," since they acquired military, political, and economic advantages. Presumably only when religious leaders lack such advantages does he consider them genuinely religious. Significantly, Bel's distaste for the leaders of popular Sufism is shared by many Muslim modernists. I have already cited one such scholar, Fazlur Rahman, who speaks of the popular development of Sufism throughout the Muslim world as in the hands of "spiritual delinquents" from the fourteenth century onward (1968: 185.) Rahman is much more precise than Bel on periodization and nuances of doctrine, and broader in scope, since he is concerned with the entire Muslim world. But his overall argument on the detrimental effect of popular Sufism as a doctrine upon the Muslim masses through at least the eighteenth century—and, in such areas as North Africa, well beyond—is largely in accord with that formulated by Bel (Rahman 1968:153–202, 237–260).

Given the emphasis of such colonial historians as Bel and of such Muslim modernists as Rahman upon the widespread appeal of popular Sufism, it is surprising how little detail is presented on the exact nature of such beliefs or, for that matter, of what prompts their popular acceptance. The issue of whether certain marabouts were "sincere" or charlatans is a red herring. Unless the Muslim masses at various historical periods are viewed as inert consumers of their religious tradition and passively open to all forms of deception (or, as Bel also argues, saddled with a religious understanding of the world fixed for all time), it

seems reasonable to attempt to formulate as explicitly as possible just what these popular beliefs are. Admittedly, there is a significant French colonial literature which traces the spiritual genealogies of marabouts and the assumed links between religious orders. Such studies thus follow the form of traditional legitimation used by marabouts (which I will later discuss in detail) and give little indication of why they are popular. These studies particularly flourished in the late nineteenth and early twentieth centuries. The French were uneasy about the formation of a “pan- Islamic” movement which, spread through the transnational routes of the pilgrimage and the transcolonial links of religious orders, constituted a potential threat to European rule (e.g., Rinn 1884). With few exceptions, even later colonial literature (e.g., Drague 1951) reads more like police dossiers on the potential influence of various orders, together with certain formal, written elements of their doctrines, than an attempt to understand their popular character and appeal.

What, then, is the driving force of popular conceptions of Islam which have sustained rituals and beliefs associated with maraboutism over a period of centuries? Why do men maintain ties with marabouts? Claiming that many marabouts are “charlatans” or “spiritual delinquents” hardly constitutes a response to this basic question. Even if, as Bel says, there is a religious substratum so powerful in North Africa that it severely limited the form which Islam could take in that region, perhaps it will be rewarding to look unapologeti- cally in detail at what he terms “popular religious fictions” and “pious legends.” The following chapters are intended to construct a base for understanding such conceptions.

** 2. Marabouts and Local Histories: The Sherqawa

*** The Importance of Local History

The Maraboutic Crisis, like much of Moroccan history until the nineteenth century, consists of a plurality of local histories. One of their dominant themes is the struggle of various sultans to overcome and manipulate various regional and local loyalties and alliances. Marabouts played major roles in these struggles.

Still, little attention has been paid to marabouts and maraboutism. The contemporary Moroccan historian Abdallah Laroui suggests that the Maraboutic Crisis and maraboutism are regarded by Moroccans as issues that belong to a period of disunity and even “decadence.” As a consequence, he continues, Moroccan historians have hardly begun to investigate the resources available for their study (Laroui 1970:212–213, 256).[13] Admittedly, such inquiries present difficulties, particularly for historians confined to the study of written sources. Most discussion of marabouts and maraboutism in traditional chronicles has been accurately characterized as little more than stereotyped responses to questionnaires fixed by tradition (Levi- Provengal 1922:49, 56). These sources tacitly omit any aspect of maraboutism incongruous with the formal tenets of Islam. Marabouts are generally referred to only as pious religious scholars and as saints (wali-s) devoted to the praise of God, with highly circuitous references, or none at all, to their political and other mundane activities. One reason for this was that marabouts constituted real or potential threats to the power and authority of the Makhzen. Since most traditional chroniclers were attached to the sultan’s entourage or dependent upon his good favor for their well-being, it was circumspect to ignore the whole issue (Levi-Provengal 1922:43).

Nevertheless, at least some events concerning marabouts are signaled, if not described, in these texts. The structure of traditional chronicles indicates that they were intended for a discerning Moroccan audience intimately acquainted with the social fabric in which the actions they report took place, as well as with the key personalities whose actions are described. Such accounts are not intended to be complete in themselves. For their original audience, an oblique reference to an incident was sufficient to induce the reader to seek out, if necessary, alternative, nonwritten sources of information. Of course, the major transformations in the social fabric over the last century have led to the contraction and disappearance of such alternative sources and of interest in them. The result is that, for many Moroccans, even the events of the nineteenth century, let alone those of earlier periods, are no longer fully intelligible.

This chapter presents elements of a social history of the Sherqawi religious lodge. The period from the origins of the Sherqawa in the late sixteenth century to the beginning of the nineteenth century is presented primarily on the basis of traditional chronicles. These sources are complemented for the nineteenth century by the accounts of European travelers and, more importantly, by correspondence between the Sherqawa and various sultans, Makhzen officials, merchants, religious scholars, tribal councils (/m^a-s), overseers of agricultural estates, and, for the beginning of the twentieth century, the French. This material is invaluable for understanding the social and political context in which marabouts operated during the nineteenth century. It also clarifies earlier periods, for, as Laroui implies, there is no reason to assume any radical discontinuity in the Moroccan social order between the sixteenth century and the opening of the twentieth (1970:213). An appendix presents in more detail some of the complex political intrigues of the late nineteenth century. The relegation of this material to an appendix does not mean that I regard it as of secondary importance. To my knowledge, no other detailed account of precolonial maraboutic factionalism exists. Although such evidence is closely tied to my main argument, its presentation requires a more microscopic attention to detail than the other elements of this chapter.

*** The Rise of the Sherqawi Zawya

From its foundation in the late sixteenth century until the beginning of the French protectorate in 1912, Boujad was the only settlement of significance on the Tadla Plain and was considered one of the most important religious centers in the Moroccan interior (A. Nasiri 1906–1907:1, 346–347; Foucauld 1939:121; Levi-Provencal 1922:297–298), with a population composed of the maraboutic Sherqawa and their slaves and clients. The latter included a significant Jewish community.

Boujad’s location makes sense primarily in terms of the configuration of the maraboutic geopolitics of preprotectorate Morocco. To paraphrase Marc Bloch (1964:83–84), it is necessary to lay aside the spectacles of men of this century to understand the implications of maraboutism. Moroccans of the sixteenth century and later never lacked a vigorous realism. Part of this realism was attaching as much importance to marabouts, visits to their shrines, and pilgrimages to Mecca as to battles, trade, and contests over the sultanate. As a local pilgrimage center, Boujad served as a mediating point between local patterns of Islamic ritual and belief and those forms shared with the rest of the Muslim world. Largely as a consequence of this original role, complex lines of communication grew up around the town. Boujad emerged as a mediating point for trade and political negotiation with the Berber highlands to its immediate east and as a local market center. Nevertheless, the most important ties between the Sherqawa and their tribal clientele for at least the last 150 years have been with the Arabic-speaking tribes of the western plains, Shawya, Tadla, and

Dukkala. These ties continue to the present.

The town is located near, but significantly not at, points of former strategic importance. In the frequent campaigns of reconquest characteristic of the more ambitious sultans in precolonial Morocco, the main route of penetration of the western plains and the Middle Atlas Mountains was along the Umm er-Rbi‘ River. A religious lodge located along this route would have been more vulnerable to the vicissitudes of Makhzen politics. Similarly, settlement closer to the Middle Atlas Mountains would have left the town more open to attacks from the Berber highlands. Such threats remained significant several years after the French established a military post in Bou j ad in 1913. The town of Bni Mellal to the south, located directly at the base of the mountains, was still subject to the incursions of “dissident” tribesmen in the early 1930’s.

Although founded in the late 1500’s, the Sherqawi zawya did not become a significant factor in Morocco until a century later. Its ascendancy is closely linked with the decline of another religious lodge, that of ed-Dila, which played a critical role in the last stages of the Maraboutic Crisis.[14] A brief discussion of the vicissitudes of this zawya places the rise of the Sherqawa in perspective. The ruins of ed-Dila are located approximately fifty kilometers to the southeast of Boujad, near the present Middle Atlas settlement of Ait Ishaq. A fast-moving series of alliances and conquests culminated in 1650 with ed-Dila’s conquest of Fes, which was held for about a decade. At its apogee the marabouts of the zawya held a good part of the plains of northeastern Morocco, as well as the Middle Atlas Mountains, where they commanded the loyalty of the region’s Berberspeaking tribesmen. For a few years Meknes, Sale, the Gharb Plain, and the region from the south of the Middle Atlas Mountains to the outskirts of Tafilalt was in their domain. At the center of this “maraboutic fiefdom,” ed-Dila, the Qur’an was reportedly recited nonstop night and day.

Ed-Dila’s power against the sultanate is demonstrated by the fact that it served as a sanctuary for the ‘Alawi Mulay Rashid when he revolted against his reigning brother in 1659. Later, in 1668, during his reign as sultan (1664^-1672), Mulay Rashid saw ed-Dila as a threat, destroyed it, dispersed its client tribes, and sent its principal marabout and his entourage in exile to Ottoman-controlled Tlemgen, in what is now Algeria.

A grandson of the exiled marabout tried a comeback with Ottoman support in 1677, during the reign (1672–1727) of the strong-man consolidator of the ‘Alawi dynasty, Sultan Mulay Isma‘il. Ed-Dila was rebuilt and again supported by most of the tribes of both the Middle Atlas Mountains and the Tadla Plain. Mulay Isma‘il managed to destroy the lodge, but only after several unsuccessful, heavily resisted expeditions. Tribal resistance was only gradually broken. To keep it that way, by the late seventeenth century Mulay Isma‘il had established a chain of fortresses and garrisons along his principal lines of communication. One such fortress was Qasba Tadla (built in 1687), thirty kilometers to the southeast of Boujad (Chapelle 1931: 26–27; A. Nasiri 1906–1907:1, 65, 70, 92, 107).

The role of the Sherqawa in this vital conflict is uncertain, except that they were closely linked with both sides and at the critical moment managed to cast their lot with the ‘Alawi dynasty.[15] The historian al-Ifrani (d. 1670), who wrote at least part of his account of the earlier Sa‘adi dynasty while at Boujad,[16] portrayed the second principal marabout of ed-Dila, Sidi Muhammed ben Abu Bakr (1560–1637), as the disciple of a number of leading saints in the Maghreb until finally he declared that Sidi Mhammed Sherqi was his “spiritual guide” above all others. Thus Sidi Mhammed Sherqi acquired “an authority and

consideration superior to that of his contemporaries" (Ifrani 1888:276–280). Sidi Muhammed ben Abu Bakr's successor during ed-Dila's apogee, Sidi Muhammed 1-Hajj (15891671), is also said to have exchanged "correspondence and reproaches" with a grandson of Sidi Mhammed Sherqi, Sidi Muhammed Mfaddel ben Hmed 1-Mursli (d. 1664) (A. Nasiri 1906–1907:1, 141–142). Neither al-Ifrani nor other writers further elaborate the nature of ed-Dila's ties with Sidi Mhammed Sherqi or any of his successors as marabout (see Fig. 2).

Such relations were clearly of paramount significance, since in the 1680's Boujad became the most prominent of the "loyalist" zawya-s supporting the sultan: "Sultan Mulay Isma'il, when he was certain that the Sherqawa had no desire for temporal power, showered them with consideration and honors; the tomb of the ancestor of the Sherqawa became one of the most visited sanctuaries of the Empire. By the end of the seventeenth century this zawya acquired an importance which had only previously been obtained in the Tadla region by the house of Dila" (Levi-Provencal 1922:297–298).

*** The Sherqawa through Traditional Sources

Traditional accounts, such as that of al-Qadiri (d. 1712), based on earlier manuscript sources, provide only stylized information concerning Sidi Mhammed Sherqi and his successors.[17] Al-Qadiri devotes a large part of his biographical notice to the proper orthography of the founding marabout's name, his patrilineal antecedents (including doubts as to whether he really is a descendant of the caliph 'Umar), a listing of his Sufi masters, the fact that he had moments of "mystic exaltation," and a brief anecdote suggesting his theological position on God's attributes versus that of Sidi Hmed bel Gasem, a neighboring marabout in Bni Mellal (Qadiri 1913:127–129).

For anthropological purposes, most of the traditional accounts appear at first to have a thin yield. There is no material that suggests the nature of maraboutic succession, the internal organization of zawya-s, or their economic activities, and exceedingly little on popular attitudes toward marabouts. For instance, al-Qadiri makes no attempt to elaborate the implications of ‘Umari descent as claimed by the Sherqawa and certain other maraboutic groups. In the political context of the seventeenth century such a claim could be considered as a means of placing marabouts and their descendants outside of direct contention for the sultanate, which required descent from the Prophet. At the same time, ‘Umari descent maintained all other distinctions from “commoner” descent, including the right to marry female descendants of the Prophet. Similarly, the marabout’s origin is said to

be the Werdigha tribe, which presently is one of the client groups to the Sherqawa. But no other mention is made of his relations with local tribes or the fact, at least in terms of the oral history of contemporary Sherqawa, that the marabout first established a zawya at Taghzirt, a village to the south of Qasba Tadla, but left there following friction with neighboring marabouts.

Al-Qadiri writes tautologically that Sidi Mhammed Sherqi was one of the great Sufi shaykh-s because of his widespread reputation and numerous disciples. “Through him God showered rewards on a multitude of faithful, of whom many distinguished themselves by their outstanding virtues and their baraka” (1913:127–129). No context is given which allows a more precise understanding of baraka, its recognition or transmission, the importance attached to claims of genealogical descent, or other issues which would clarify the significance of marabouts in Moroccan society. All such concerns are either taken for granted (a fact that in itself is critically important) or considered beneath mention.

Only a faint echo of maraboutic geopolitics enters the quasiofficial, Makhzen-centered traditional historiography. Sidi Mhammed Sherqi received religious and mystic instruction from his father, Sidi bel Gasem (not the same person as Sidi Hmed bel Gasem of Bni Mellal), and from two other shaykh-s^ who themselves had been instructed by Shaykh ‘Abd l-‘Aziz et-Tebba (d. 1508), al-Jazuli (d. 1465/1466), and (through other intermediaries) esh-Shadili (d. 1258). This particular chain (silsila’) of instruction places the Sherqawi marabout in the pro-Moroccan mystic tradition mentioned in the last chapter. Al-Qadiri’s anecdote regarding the relations of Sidi Mhammed Sherqi with Sidi Hmed bel Gasem of Bni Mellal states that the two were “like the grindstones of a mill, crushing anyone who came between them,” despite their theological differences on the nature of God’s attributes. A more politicized account of the relations of the two marabouts is provided by al-Ifrani. He writes that in the late sixteenth century the governor of Tadla, en-Naser 1-Ghaleb Billah, revolted against his paternal uncle, the Sa‘adi sultan Hmed ben Mansur (1578–1603). Sidi Hmed bel Gasem supported en-Naser, who was soon captured, paraded throughout the Tadla Plain, and finally beheaded. Sidi Mhammed Sherqi, who by inference was more successful in his alliances, is reported to have said of his unfortunate maraboutic colleague “Poor Baba Hmed! He saw en-Naser’s head enter Tadla and thought it was en-Naser!” (Ifrani 1888:101) .[18] Such political activities become clear only for the later period of the nineteenth century, when information beyond that of the traditional chronicles becomes available.

The traditional accounts are valuable at least in revealing aspects of the Sherqawi zawya that existed only in truncated form at later times. During the seventeenth and eighteenth centuries, the Sherqawi lodge had a substantial reputation as a center of religious learning, so that in this respect it is accurately represented by the traditional paradigm of hagiographic historiography. Thus, during the lordship of Sidi Saleh (d. 1723) (2–5),[19] the historian al-Ifrani was resident in Boujad. At such close range to the Sherqawa, the historian must have been familiar with the full scope of their activities but generally recorded only those which fell within the available historiographical paradigm. The conclusion of his history of the Sa‘adi dynasty (1888: 310) is a panegyric to Sidi Saleh, at one point calling him “the seal [i.e., the most perfect] of the saints” (khatem el-awliya), a phrase echoing that reserved for Muhammed, “the seal of the prophets.” Al-Ifrani and the marabout carried on a frequent correspondence, through which the former often sought subsidies for his writings (Levi-Provengal 1922:119–120). Sidi Saleh himself appears to have been highly educated and in touch with, if not an internal part of, the network of urban-oriented religious scholars (^ulama, sg., ‘alern). As a youth he studied in Fes at the Medrasa Mesbahiya, the school of

the Qarawiyin Mosque-University which seems to have particularly attracted students from the Tadla. Among his teachers was Sidi Hmed ben Naser, later to become one of the principal marabouts of the important Nasiriya religious order situated in Tamgrut, in Morocco's pre-Saharan south (Ecorcheville 1938).

Sid 1-Ma'ti (d. 1766) (2–6), Sidi Saleh's son and maraboutic successor, studied the religious sciences under his father, a paternal uncle, and three non-Sherqawi religious scholars who were attached to the zawya. A fourth taught him medicine. From childhood he is said to have possessed mystic inspiration (JiaT) and to have often gone into trances (ghadb'). At least one account uncharacteristically refers to "magical" acts performed by him, although these are not described in any detail (Lakhdar 1971:227). Sid 1-Ma'ti was best known for a sixty-volume collection of prayers which he compiled with the aid of three of his disciples and secretaries. Both Sid 1-Ma'ti and his father had their biographies written by secretaries who came from Wlad 'Abdun (Shawya) and Bni Khiran (Levi-Provengal 1922:297–298; Niegel 1913:290), tribal groups over which the Sherqawa have exercised considerable influence since at least the nineteenth century and probably much earlier. Names of other secretaries and students (tolba^ sg., taleb) indicate provenance from most of the principal regions of Morocco; occasional references prior to the nineteenth century also suggest that Sherqawa established themselves in major cities elsewhere (e.g., A. Nasiri 1906–1907:1, 155).

The overall picture that emerges from these small details is that the Sherqawi zawya and its marabouts played an important role in Morocco's intellectual life. The sharp dichotomy between rural religious leaders and religious scholars which tended to characterize Morocco (with the possible exception of the Sus region in the south) during the colonial era and independent Morocco of the nineteenth century is thus no accurate indication of the earlier realities.

The Sherqawa were linked with many of the other major maraboutic centers in the country, although, barring new sources, it is impossible to trace these with any precision. Thus Sidi Mhammed 1-Ma'ti (d. 1662) (2–4) was initiated into the Nasiriya religious order by the marabout Mhammed ben Naser (d. 1674) (Drague 1951:205),[20] as was his son Sidi Saleh. Similarly, Sidi 'Ali ben Hamdush (d. ca. 1720), founder of the ecstatic Hmadsha order of Meknes, was a disciple of Sid 1-Hafyan ben Sid 1-Mursli esh- Sherqawi,[21] whose shrine in Boujad is regularly visited by Hmadsha pilgrims.

The last Sherqawi lord discussed in traditional sources is Sid l-'Arbi (d. 1819) (2–7). These sources are particularly interesting because they are complemented both by oral tradition of the Sherqawi elite and by the testimony of a foreign observer. The late-nineteenth century Moroccan historian, al-Nasiri, describes the Sherqawi zawya as "one of the most renowned of the Maghreb," which "for centuries ... has been directed by eminent men who have transmitted from one to the other the heritage of saintliness and preeminence" and who have been treated with "care and respect" by the 'Alawi dynasty. These remarks preface his report that Sultan Muhammed ben 'Abdallah (1757–1790), himself "glorious and noble," destroyed most of Boujad during a military expedition in 1784/1785. Al-Nasiri provides no explanation for the friction which existed between the two except to say that chiefs must act severely towards those they command and that no man is perfect except those whom God has so created (1906–1907:1,346–347).

Oral tradition, substantiated in part by written documentation, places the destruction of Boujad in 1784/1785 in a more meaningful context. Until the late eighteenth century, the

Sherqawi zawya served as a collective granary for nearby client tribes and as a sanctuary powerful enough to provide security for refugee tribesmen and Makhzen officials negotiating amnesties (aman-s) from the Makhzen. Sid l-'Arbi (2–7) had extensive land holdings (see Fig. 4) and reputedly possessed a vast fortune, considered by some to rival the sultan's (Ecorcheville 1938). Under these circumstances, the sultan appears to have seen the Sherqawi lodge as a threat. The tactics he used in destroying the zawya may have struck al-Nasiri as less than "glorious and noble," for he fails to report them. According to members of the Sherqawi elite in the 1930's, Sultan Muhammed ben 'Abdallah sent a message to Sid l-'Arbi to join the royal expedition as it approached Boujad. The first Makhzen troops began arriving just as the sid left Boujad. Sensing deceit, he quickly returned. Later, after destruction of the town and the granaries had begun, the sultan told Sid l-'Arbi that he was not taking action against the Sherqawa, only against certain non-Sherqawa who had sought refuge in Boujad. For two days the troops sacked the town, took tribesmen as prisoners, and left intact only the shrines of Sidi Mhammed Sherqi and Sid 1-Ma'ti and the houses which stood between them. 'When the pillaging ended, the sultan provided Sid l-'Arbi a convoy of sixty mules and brought him to Marrakesh (Ecorcheville 1938:49–51). The marabout remained in a sort of "forced residence" in Marrakesh and its region for eight years, at least two of which were spent in the nearby village of Bzu (see Eickelman 1972–1973:44).

Sid l-'Arbi's exile seems to have diminished neither his prestige nor his personal wealth. During it at least twenty-nine large estates in the Bzu-Demnat region were given him by tribes anxious to secure his intercession. These are still collectively owned by his descendants and yield substantial revenues. The sultan also recognized the marabout's continuing influence. At least twice, Sid l-'Arbi served as emissary (together with Mulay 'Ali, principal marabout of the zawya of Wezzan) to the sultan's son Mulay Yezid, who, with the support of Berber marabouts and tribesmen in the Rif and Middle Atlas mountains, had revolted against his father.

When Sultan Muhammed ben 'Abdallah died in 1790, Sid l-'Arbi was caught in an untenable position in the ensuing struggle over his succession. One of the sultan's sons, Mulay Hisham, was recognized as sultan in Marrakesh, where the marabout was residing. Mulay Yezid was recognized elsewhere. Sid l-'Arbi was compelled to give his oath of allegiance (Z><zy'«) to Mulay Hisham and was allowed to return to Boujad. After a bitter struggle which lasted two years, a third son, Mulay Sliman (1792–1822), was recognized as sultan throughout Morocco. Sid l-'Arbi went to Fes to appease him but was treated contemptuously and not allowed to return to Boujad until twenty months later (Drague 1951:86, 232; Ecorcheville 1938: 51–52; cf. A. Nasiri 1906–1907:1,347).

The continuing strength of the Sherqawa through this period is clear from the account of Ali Bey (Domingo Badia y Leblich). Ali Bey was in Morocco from June 1803 to October 1805 and saw a nephew of Sid l-'Arbi in Marrakesh. On the basis of what he learned, Ali Bey depicted Sid l-'Arbi and the lord of the zawya of Wezzan as the "two greatest saints of all the empire of Morocco ... These two saints decide almost on the fate of the whole empire, as it is supposed that they attract the blessings of heaven on the country." The region surrounding the Sherqawi lodge was described as having no representative of the sultan and paying no taxes to the Makhzen. The marabout's household was obviously substantial, as he is described as keeping, besides his wives and common concubines, eighteen young Negro girls. When Sid l-'Arbi visited other regions, he gave "orders and advice" to the governors of the sultan, received substantial presents and alms, and was avidly consulted by women and followed by crowds of poor people who sang his praises. He traveled surrounded by an armed retinue "ready to defend the divine cause with their weapons." The marabout himself was "easy on horseback, and a clever shot." Politically,

Sid l-'Arbi preached "submission to the Sultan, domestic peace, and the practice of virtue" (Ali Bey 1816: 176–177).

Sid l-'Arbi's relations with Mulay Sliman appear to have been generally satisfactory. As a youth, Mulay Sliman spent several years in Boujad, and later, as sultan, he maintained a large house there.[22] In 1805 he built what remains Boujad's principal mosque. These actions suggest close ties with the Sherqawa. Nonetheless, Ali Bey wrote that the sultan and the Sherqawi marabout had a falling-out, after which Sid l-'Arbi converted the mosque into a stable. To end the quarrel, the sultan sent the marabout a thousand ducats, which the marabout reciprocated with a thousand sheep, to indicate that the matter was settled. Ali Bey speculates that the quarrel rested on nothing but "some little want of attention" (1816:178).

North African maraboutism did not operate in a sealed vacuum throughout this period. Toward the latter part of his reign, Mulay Sliman was strongly influenced by Wahhabi emissaries from Arabia. These persuaded him to write a treatise condemning maraboutism as against the fundamental tenets of Islam and to issue a proclamation forbidding maraboutic festivals (musem-s) and visits to mara- boutic shrines (Abun-Nasr 1963:94–95). Such an attempt was markedly unrealistic in the context of North Africa. Sid l-'Arbi remained a loyalist when the sultan faced a series of revolts led by Berber marabouts. He also advised the sultan not to take a personal part in a punitive expedition to the Middle Atlas in 1818. The sultan ignored this advice, suffered a major defeat, and was taken prisoner (but, because of his bar aka, was personally unharmed) after having been betrayed by a qaid from Shawya. After the sultan was released, the rebel qaid sought sanctuary (horma) in Boujad, where he was later assassinated (Mission Scientifique du Maroc 1915:1,164). The inviolability of the right of sanctuary appears to have been weighed against the question of Sherqawi relations with the Makhzen.

The Makhzen paid equal attention to the nuances of Sherqawi affairs and presumably to those of other major maraboutic lodges. When Sid l-'Arbi died of the plague in 1819 (A. Nasiri 1906–1907: 11,50), Sultan Mulay Sliman delayed a year in confirming a successor. This probably was in order to assess the suitability of the various contenders to the Sherqawi lordship in the light of Makhzen interests as well as the strength of various contending factions. The elder son of Sid l-'Arbi had been in the sultan's entourage as a student (perhaps also as a guarantee of the marabout's loyalty?), but the sultan had earlier suggested to Sid l-'Arbi that his son should discontinue his studies "since it is impossible for a married man with one wife, let alone two, to pursue studies" (E, 6 July 1810 / 5 Rejeb 1225). He was passed over in favor of a younger brother, Sidi ben Dawd (2–8), then eleven years old. In a decree addressed to the elder brother, Sidi ben Dawd was invested with "possession of that which is due him by paternal, maternal, and fraternal succession," as well as with the "secret" of his ancestors (E, S, 12 July 1820 / 10 Shawwal 1235). Presumably the choice of the younger brother was to favor a faction within the Sherqawa that would be dependent upon the Makhzen for its well-being. In any case, there are numerous subsequent requests from Mulay Sliinan and succeeding sultans throughout the nineteenth century ordering Sidi ben Dawd to furnish the Makhzen with specified numbers of horsemen from tribes in a client relationship with the Sherqawa (e.g., E, 6 March 1821 / 26 Jumada I 1236) and to perform other services on their behalf.

Such incidents as the above indicate that a key determining factor in the roles played by the Sherqawa was their relative strength and capability in relation to that of the sultan and his entourage. Sherqawi power and influence were no more given, fixed elements in

“traditional” Morocco than any other component of society. There is evidence that the scope of Sherqawi political interest was remarkably wide. The Sherqawa followed not only the intricacies of Makhzen politics but also those of the Ottomans and those of the French in Algeria (e.g., E, Mulay ‘Abd er-Rahman to Sidi ben Dawd, 7 October 1844 / 24 Ramadan 1260). Undated notes in Boujad also indicate that travelers w[T]ere regularly questioned on the news of important personages in their own locality.

*** The Zawya in the Late Nineteenth Century

A fuller picture of the social role of the Sherqawi lodge can only be given beginning with the 1880’s. A particularly valuable, although not always accurate, source is the French explorer-priest Charles de Foucauld, who traveled through Morocco disguised as an Algerian Jew and stayed at Boujad from 6 to 17 September 1883. By that time, Boujad no longer served as a collective granary for tribes of the region—this function had presumably ended in the previous century. Boujad still served, however, as a major market center. Some Sherqawa participated in the market as merchants (as did many non-Sherqawa) and as guarantors of the market’s peace. The weapons of tribesmen were deposited with the lord of the zawya or one of his kinsmen for its duration. Sherqawa also served as escorts (zettat-s) for caravans of merchants and other persons seeking safe passage through their region of influence. A Sherqawi riding on a mule with a red saddle, followed, if he had sufficient prestige, by a slave holding a parasol, was a familiar sight alongside such caravans. Escorts were chosen and fees assessed according to the value of the caravan. A two- or three-hundred-camel caravan, for instance, was escorted by a close relative of the leading marabout (Foucauld 1939:130). The average fee during the reign (1873–1894) of Mulay Hasan I was one- half ryal per camel, according to an elderly Sherqawi notary. From manuscript letters between Sherqawa and leading merchants elsewhere in Morocco, it is clear that the main commercial route to Boujad was through Casablanca, a journey of approximately four days in good weather. Goods from Fes, Rabat, and overseas also came to Boujad through Casablanca, although a certain amount of trade was carried on directly with Marrakesh, an eight-day voyage. But this route was considered in general to be much more precarious, since many tribes of the Marrakesh region had no regular relations with the Sherqawa. Subsidiary caravan routes linked Boujad with Bni Mellal and Khnifra. Only exceptionally was there direct contact with Fes via the Middle Atlas Mountains, as when Fes, the Middle Atlas tribes, and a faction of the Sherqawa supported the insurgent Mulay Hafed against his brother Mulay ‘Abd l-‘Aziz in the struggle for the sultanate that erupted in 1907 (Martin 1923:473).

Principal goods included tea, rice, sugar, spices, cloth, perfume, jewelry, household utensils, and luxury clothing (Foucauld 1939: 127). These were exchanged for animal hides, wax, wool, horses, camels, sheep, goats, and grain from tribesmen. Most of the same range of animal products were offered the Sherqawa as donations from their clients. Much of this extralocal commerce was typically in the hands of dyadic trading partners who could claim complex, diffuse bonds of kinship or common origin. For instance, Sherqawa and other Boujadi-s lived in their own quarter in Khnifra, where they worked as muleteers and representatives for merchants in Bouj ad (F. Berger 1929:44—45). Similar arrangements existed in Bni Mellal, Casablanca, and other centers linked economically with Boujad.[23] The extent to which the Sherqawa actively engaged in this commerce is not clear from the sources. Regular correspondence and gifts were exchanged between prominent Sherqawa and leading merchants of Rabat and Casablanca, as well as with the sultan and other Makhzen officials. Those ties were not strictly limited to commerce. A letter from a major Fassi merchant, Hajj Tayyeb Gsus (Guessous), ensured Foucauld a good reception upon his arrival in Boujad (Foucauld 1939:128). Itinerant artisanal specialists, such as those from Marrakesh who carved the intricate woodwork characteristic of the houses of leading

Sherqawa and shaped the domes of shrines, were also engaged through such contacts.

Foucauld estimated Boujad's population at 1,700, including the Sherqawa, their slaves, and their clients. The latter included around two hundred Jews. In Boujad, as in Demnat to the south (Flamand 1952) and other Moroccan towns, Jews were not confined to a special quarter (mellah). Only the quarter containing the synagogue (3–10) was called the mellah by Boujadi-s, although Foucauld used the term to refer generically to any residential cluster of Jews, including two (3–11, 3–12) without synagogues. In the preprotectorate period, Jews clustered about the houses of the wealthiest and most prominent Jewish merchants. Foucauld makes no specific mention of the economic activities of the Jewish community. Both Muslims and Jews engaged in grain trading; largely Jewish specialties included work as bellowsmakers (rwabzi-s), itinerant jewelers, and cloth merchants. Many Jewish merchants and craftsmen made the rounds of the small rural markets. Others, such as butchers, dealt exclusively with the Jewish community itself. In general, each Jewish household had ties with particular Sherqawa and relied upon these for protection in time of crisis.

The religious and political influence of the Sherqawa extended considerably beyond the range of tribes which used Boujad as a weekly market. Foucauld wrote that almost all tribes within two days' journey of Boujad in any direction were in a client relation to the Sherqawa. These included the Bni Zemmur, Sma'la, Bni Khiran, Werdigha, Bni Meskin, Ait Rba', Bni 'Amir, and Bni Musa tribes. Regular gifts—Foucauld calls those of tribal collectivities "tribute"— also came from most of the tribes of the Shawya, as well as Middle Atlas tribes including Ait Seri and Ishqern (Foucauld 1939:117–118, 122).

[[d-f-dale-f-eickelman-moroccan-islam-15.jpg]]

[[d-f-dale-f-eickelman-moroccan-islam-14.jpg][Figure 3. Boujad. 188. (Based on Foucauld 1888:55.)]]

Foucauld estimated the gifts in wheat alone which arrived at the zawya as four hundred camel loads the week before his arrival and two hundred during his twelve-day stay (1939:122, 125). This figure must be adjusted seasonally, however, as September is the only time at which collective, tribal pilgrimages are made. These collective offerings were made primarily to the lord (sid) of the zawya, although many also were made to other Sherqawi marabouts having special relationships with particular groups. Some of this wealth was redistributed among the Sherqawa. The most prominent (and wealthy) saw to the well-being, or at least the maintenance, of their less fortunate kinsmen. A limited amount of Sherqawi wealth found its way back to the tribes in the form of seeds for fall planting and, in at least one case (Foucauld 1939:121), the construction of a fortified enclosure for the Bni Zemmur. Offerings and sacrifices made at other times of the year were primarily made by individual pilgrims or their proxies—tribesmen, influential merchants, the sultan, and members of his entourage. These were directed to any Sherqawi regarded as capable of obtaining God's blessings (baraka) for the supplicant. Neither Foucauld nor other commentators on maraboutic activities during the nineteenth century make any distinction between regular offerings and sacrifices made by tribal collectivities and occasional ones made by both tribal and nontribal individuals.

Foucauld wrote that the Sherqawa lived exclusively from offerings, but this claim is misleading. They also had revenues from commercial activities, the vast holdings of land in the hands of individual Sherqawa or their legal heirs (such as those of Sid 1-Hajj l-'Arbi [2–9]), pious endowments (ahbas', sg., habus), agricultural estates ('azib-s), and a substantial traffic in influence with the Makhzen.

The 'azib-s are particularly important for what they reveal of the nature of Sherqawi relations with other centers of power in Moroccan society. But the exact meaning of 'azib is also difficult to elicit from nineteenth-century sources. In a general sense, 'azib refers to any agricultural estate with an absentee owner (Aubin 1906:15). In reference to the Sherqawa and other marabouts, the term is more complex. According to context, 'azib can refer alternatively to an agricultural estate with special privileges recognized by the sultan or to workers or tribesmen attached to such an estate. Agricultural holdings beyond the pale of effective influence of the sultan, such as the holdings acquired by Sid PArbi (2–7), are never referred to by this term, although rights to them were firmly established in Islamic law and safe from tribal incursions. Much of the Sherqawi agricultural land in the Boujad region was held by individual Sherqawa or their descendants by Islamic law. Most of these holdings were irrigated orchards that were cultivated by slaves or other clients of the Sherqawa and constituted the only permanent rural settlements in Boujad's region. Evidently only the supernatural sanctions available to the Sherqawa were capable of insulating these enclaves

from the region’s general insecurity. Figure 4 represents both these individual holdings and those of ‘azib-s as they were roughly from the end of the reign (1873–1894) of Mulay Hasan I to the eve of the protectorate. Not shown are urban properties—houses, baths, subsidiary zawya-s—in Casablanca, Meknes, Fes, and Sale, as well as scattered holdings in the High Atlas mountains.[24] The status of ‘azib-s was more indefinite than that of the individual holdings. Some of these estates were occupied by Sherqawi clients; others were occupied by Sherqawa who had left Boujad and settled in tribal regions, often at the invitation of the host group. The documentation for these estates, consisting primarily of royal decrees (daher-s) and correspondence with Makhzen officials (E, S), indicates that both the estates and their inhabitants were exempt from direct Makhzen authority. Their inhabitants were not subject to corvee labor or to requests for troops, as was the case with other subjects of the Makhzen (e.g., E, decree of Sultan Muhammed IV, 3 September 1864 / 1 Rbi‘a II 1281). Royal decrees also specified that the taxes (zakat and ‘ashur) imposed on the inhabitants of Sherqawi ‘azib-s were to be paid directly to the lord (mqadderri) of the Sherqawi zawya in Boujad and used for his benefit. As the map indicates, most estates were concentrated in the Shawya region of western Morocco and were in the midst of tribes submitted to the direct Makhzen control. This location is in itself significant. Edouard Michaux- Bellaire, a prominent French ethnographer in the early days of the protectorate who was also concerned with various political affairs, arbitrarily saw ‘azib-s as a means of extending Makhzen sovereignty to peripheral regions by vesting it in maraboutic proxies. This may have been true in some instances but was decidedly not the case for Sherqawi holdings (Michaux-Bellaire 1913:229; cf. Eickelman 1972— 1973:42–46).

[[d-f-dale-f-eickelman-moroccan-islam-22.png][Figure 4. Western Morocco and the Sherqawa in the late nineteenth century.]]

Names of tribes and tribal sections are in roman type, names of small settlements or towns in italic.

Significantly, the status of these estates appears to have been constantly tested by the Sherqawa of Boujad, subsidiary groups of Sherqawa located outside of Boujad, tribes, local officials of the Makhzen, and the Makhzen itself. It is not always clear whether a royal decree was granted voluntarily by the sultan or whether it was simply the de facto recognition of a pre-existing situation.[25] The renewals of royal decrees show the range of these variations. Predictably, all decrees were renewed either singly or collectively at the accession of a new sultan. Many were also intermittently reaffirmed, indicating the constantly contested nature of these privileges (e.g., E: Mulay Hasan I, 29 November 1875 / 9 Qa‘ada 1292; Mulay ‘Abd PAziz to Sid 1-Hajj 1-Hasan, 3 June 1901 / 15 Safar 1319; Mulay ‘Abd l-‘Aziz to Sid 1-Hajj l-‘Arbi, 4 May 1896 / 21 Qa‘ada 1313; Mulay ‘Abd l-‘Aziz to Sid 1-Hajj 1-Hasan, 29 January 1901 / 8 Shawwal 1318). Sherqawi lords frequently complained to the sultan that local qaid-s and neighboring tribes did not respect or recognize presumed Sherqawi privileges. The Makhzen itself sometimes questioned the status of claimed estates (e.g., E: two decrees of Mulay Hasan I dated 22 September 1884 / 1 Dhu Hijja 1301; Mulay ‘Abd l-‘Aziz to Sid 1-Hasan, 28 May 1899/ 17 Muharrem 1317; Driss ben ‘Umar to Muhammed ben Dawd, February 1894 / Sha‘ban

1311). Qaid-s also complained that Sherqawi estates, over which they had no direct authority, were used as bases to raid neighboring tribes (e.g., E, Sultan Mulay ʻAbd er-Rahman to Sidi ben Dawd, 24 September 1853 / 20 Dhu Hijja 1269).

Certain estates were attached to subsidiary zawya-s founded by Sherqawa who had left Boujad, often at the invitation of client tribes. Sometimes these zawya-s were permanent settlements; in other cases they were local communities (dawwar-s) living in tents, which were transhumant like the tribal section to which they were attached. Most subsidiary zawya-s were situated on the Tadla and Shawya plains, although a few were located in the High Atlas and one in the Sahara at Tata, visited by Foucauld (Eickelman 1972–1973; Fou- cald 1939:136). Fields surrounding such a zawya often were cultivated for the profit of its maraboutic inhabitants, who then sent annual contributions to the lord of the Sherqawa at Boujad. In exchange for these donations, the Sherqawi lord in Boujad secured ʻazib status from the Makhzen for the subsidiary lodge. When the support of the Sherqawa in Boujad was no longer considered necessary, such offerings were cut to token amounts or were discontinued.

When this happened, a “subsidiary” zawya became autonomous.

The uncertain status of these Sherqawi estates directly reflects the fluctuating and complex nature of Sherqawi relations with the Makhzen and tribal groups, as well as internal tensions among the Sherqawa. Foucauld’s statement that the Tadla Plain in the 1880’s was a sort of “theocracy” subject only to the “authority” of the lord of the Sherqawi zawya (1939:121) is misleading.[26] This claim is based on what the Sherqawa told him. The Sherqawa most concerned with Foucauld’s visit believed that the direct intervention of France in Morocco’s affairs was imminent and thus were anxious to emphasize their prominence (Foucauld 1939:135–136). They also were aware of his French identity. Admittedly, there is no indication that taxes were regularly collected by the Makhzen from the tribes of the upper Tadla Plain. Nevertheless, Boujad had a qadi (judge of Islamic law) appointed by the sultan.[27] There was also at least a nominal qaid over the neighboring tribes during part of the reign of Mulay Hasan I, and an overseer (nadir) of pious endowments from at least the eighteenth century (E, decree of Mulay ʻAbd er-Rahman, 17 May 1827 / 20 Shawwal 1242). More significantly, the Makhzen often asserted a decisive role, as previously indicated, in the selection of Sherqawi lords. Reciprocally, the Sherqawa exercised considerable influence over the Makhzen policy toward the tribes of western Morocco. Correspondence indicates that, at least from the 1840’s, the Sherqawi lords were asked by the sultan to suggest qaid-s for the tribes of the immediate region: Werdigha, Smaʻla, and Bni Zemmur (E, Mulay ʻAbd er-Rahman to Sidi ben Dawd, 11 August 1845 / 7 Shaʻban 1261). These may have been only nominal appointments or only intermittently effective. In the 1845 letter, the sultan also asked the Sherqawi lord to report on the popular acceptance of the nominees. Any candidate unacceptable to the tribal councils (jma[(]a-s) of the groups involved was not to be confirmed. Clearly such qaid-s owed their position to the Sherqawa. Moreover, at least some of them built houses in Boujad, suggesting long-term associations with the Sherqawa. By the reign of Mulay Hasan I, the Sherqawa also had a strong voice in nominating qaid-s for the Shawya. Later accounts indicate that Sherqawi nominations were commonly purchased.

In return for the power of nominating qaid-s^ the Sherqawi lord was held responsible by the Makhzen for their performance. Among other obligations, the Sherqawa

were asked to secure the oath of allegiance from tribal councils at the inauguration of a new sultan (e.g., E, 31 August 1875 / 29 Rejeb 1292), provide troops from their client tribes upon request, arrange for the settlement of local disputes inimical to the interests of the Makhzen, and conduct other sensitive negotiations on its behalf. At the request of either the Makhzen or the tribes involved, the sid was often called upon to arrange amnesties (aman-s), not only for rebellious tribes of the Tadla, but also for those in Sraghna and, at least on one occasion, the Bni Mtir of the Meknes region, whose council (jma‘a’) had come to Boujad to seek an amnesty (E, Mulay Hasan I to Sidi ben Dawd, 26 January 1883 / 17 Rbi‘a I 1300). The settlement of intertribal disputes took the form of the “great [£]«r” (‘ar kbir), or contingent supernatural curse (see Westermarck 1926:518–569). After preliminary negotiations, a Sherqawi marabout interceded between the conflicting groups, often carrying the cloth cover (ghota’) of the sepulcher of one of his ancestors, and asked in the name of his maraboutic ancestor that hostilities cease. By popular belief, those who refused to cease fighting would sooner or later be struck with major misfortune. This form of compulsion is known primarily from sources for later periods; hence, I will discuss it at more length in a subsequent chapter.

More mundane tasks ordered by the sultan included taking an inventory of goods of a deceased qaid and the purchase of “young, prolific goats” for his herds (E, Sultan Mulay Hasan I to Sidi ben Dawd, 7 March 1886 / 3 Jumada II 1303). The lord of the zaivya or his counselors also arranged, for a price, the release of prisoners held by the Makhzen, the return of runaway slaves to their owners,[28] and the issuance of royal decrees certifying tribal groups as descendants of the Prophet (shorfa). Presumably such descent carried with it certain privileges, such as exemption from military service occasionally demanded by the Makhzen.

Throughout the nineteenth century, there is no question of the favor of the Sherqawa in the eyes of the Makhzen. Local qaid-s and members of the sultan’s entourage sought intermarriage with the Sherqawa and exchanged as presents concubines, animals, and other objects of value, especially on the occasion of major festivals. Likewise, the Makhzen saw to the repair of Sherqawi shrines.

To monitor events in the Makhzen entourage, close relatives of the Sherqawi lord generally accompanied it (or, as I earlier indicated, may have been obligated to remain with it). One was the elder son of Sid l-‘Arbi (2–7), already mentioned. Until he became the lord of the zawya himself, a later Sid l-‘Arbi (2–9) attended court, as did Driss ben ‘Umar, the grandson of Sidi ben Dawd (2–8), who acted as escort to Charles de Foucauld in 1883 and from 1904 on worked as a translator-informant for the French and Sherqawi factotum in Casablanca. In addition, the Sherqawi lord always accompanied the sultan whenever he passed through the region of Sherqawi influence.

For the late nineteenth century, there is documentation of the internal division of leadership among the Sherqawa. Typically, the leading marabout allowed a close kinsman to undertake the more mundane, often lucrative, political tasks in order to leave unsullied his reputation of aloofness from such concern. In the latter part of the lordship of Sidi ben Dawd and for a considerable period after his death, this role was filled by his son Sidi ‘Umar, a consummate politician. Foucauld and present-day elderly Sherqawa represent him as the zawya’s “grey eminence.” It was he who negotiated the release of prisoners with the appropriate Makhzen officials. During Fou- cauld’s visit, ‘Umar detailed his son Driss (d. 1915), then twenty- five years old, to remain in close contact with the explorer in order to discern the real intention of his visit. Prior to Foucauld’s visit Driss,

like many other prominent Sherqawa, had made the pilgrimage (hajj) to Mecca. On his return Driss had visited Tunis and many of the principal cities of Algeria (Foucauld 1939:125, 130). Foucauld writes that he possessed a fair understanding of France's activities in Algeria and the potential consequences to the Sherqawa of direct French intervention in Morocco.[29] Foucauld makes clear, however, that Driss and his father kept Foucauld's true identity from Sidi ben Dawd, asserting that the latter was old and did not "understand" how to deal with the French. Such concealment also kept major political decisions in 'Umar's control.

Foucauld was evidently unaware of a major political maneuver undertaken by 'Umar immediately prior to his visit. In the spring of 1881 'Umar had arranged a meeting in Boujad between Sultan Mulay Hasan I and the Berber chieftain Mha u Hammu ez-Zayyani, after which Mha was made a qaid (Arnaud 1952:61).[30] This was part of the sultan's strategy of extending his effective authority over the Berber-speaking tribes of the Middle Atlas Mountains. Mha received arms and ammunition from the sultan, the deliveries of which were escorted by the Sherqawa through regions where they had influence.

So preponderant was 'Umar's political role in Sherqawi affairs that one anonymous correspondent complained to Sidi ben Dawd that "some say it is his zawya. not yours."[31]

Relations between the Sherqawi marabouts and outside groups were clearly not fixed during the nineteenth century or, presumably, for earlier periods. The status of the lord of the zawya and at least some of his prerogatives were legitimated by proclamations of the sultan. But the extent to which he actually was regarded as a marabout depended only in part upon the sultan. The rest depended upon the marabout's own capabilities in dominating other rival Sherqawa and maintaining a sizable tribal clientele. Competition among the Sherqawa themselves; political manipulation by tribes, the sultan, and his entourage; and an uncertain flow of events caused allegiances to marabouts to be constantly realigned. Accounts of this competition are almost totally absent from the traditional sources and, for that matter, most ethnographic presentations. Yet they are crucial to understanding the social role of marabouts.

In Boujad itself, competition for prestige in the nineteenth century and at earlier periods was largely in terms of acquiring a reputation for bar aka, even if this was manifested (as in the case of Sidi 'Umar) by sagacious political negotiations on behalf of the zawya. Sherqawa unsuccessful in acquiring prestige on the basis of this attribute had the options of becoming dependent upon their more successful relatives, of leaving Boujad to form their own "subsidiary" zawya-s, or, to a much lesser extent, of leaving Boujad for the possibilities afforded by life in an urban center.

Fortunately, there is a fairly substantial documentation on the development of factions among the Sherqawa from the early 1890's through the beginning of the protectorate in 1912. This period is of particular interest because it is the last in which marabouts were considered capable of playing significant social and political roles based upon their "special" relationship with God. As mentioned, there are virtually no other accounts of internal factionalism in North African religious lodges outside of the circumstances of colonial hegemony. Hence I present this account in detail in the appendix, concentrating upon the problems of succession. In any case, this data will be more comprehensible after my ensuing account of contemporary Boujad and the Sherqawa. This is because many of the implicit understandings involved in these factional alignments and in the popular

legitimations of claims to maraboutic qualities become clear only in the light of later events known in a fuller social context.

There are two significant features of the conflicts over maraboutic succession that developed in the 1890's: their articulation with extralocal events and their persistence over time. Tribal disputes, Makhzen manipulations of local rivalries, internal splits within the Makhzen, and the perception of opportunities by individual Sherqawa—all were closely related to maraboutic succession. After 1907 (when the French occupied Casablanca and the Shawya), colonial manipulation of local and national disputes constituted an additional factor, although French intervention was soon to alter radically the nature of these rivalries and the assumptions held by Moroccans about the powers of marabouts. No person engaged in the contest for dominance or prestige knew with certainty what style of conduct would be successful in any given situation. Loyalty to a given sultan, which in some circumstances might carry with it significant rewards, could also be a handicap should the authority of that sultan be challenged or cease to be effective. Excessive zeal in support of the Makhzen was as dangerous for powerful individuals as a reserve toward it. Positions were constantly tested and adjusted in line with personal evaluations of "the way things were."

Such conflicts showed surprising continuity over time. Shortly after Sidi ben Dawd (2–8) died in 1889, Sultan Mulay Hasan I designated the eldest of his twenty-one sons, Sid 1-Hajj l-'Arbi (2–9), to succeed him. The very number of these sons, added to the descendants of earlier marabouts, gives some idea of the possibilities for intrigue among close kinsmen. All male descendants were technically entitled to equal inheritance from their father (with lesser amounts for daughters, wives, and other relatives). As indicated in detail in the appendix, even when a marabout chose his successor, there were often bitter and prolonged conflicts. Until the death of the sultan in 1894, there was no effective opposition to the Sherqawi lord, Sid 1-Hajj l-'Arbi. He enjoyed the unqualified support of Mulay Hasan I. After the sultan's death, a still minor son, Mulay 'Abd l-'Aziz (reigned 1894–1908) came to the throne. Some of his entourage were particularly hostile to the Sherqawa and sought ways to weaken their influence. The first step was to pay regular subsidies to another son of Sidi ben Dawd, Sid 1-Hajj Muhammed (2–16). Both 'Umar and his son Driss (who lived in Casablanca and from there kept in touch with the Makhzen and, after 1904, the French) had close ties with Sid 1-Hajj Muhammed. This rival faction was nurtured by the Makhzen until finally, in 1901, both Sid 1-Hajj Muhammed and his paternal nephew, Sid 1-Hajj 1-Hasan (2–11) (who succeeded his father, Sid 1-Hajj l-'Arbi, as lord of the Sherqawa on the latter's death in 1898), were called by the sultan to Marrakesh. There he announced that the zawya and its holdings were to be divided equally between them and that henceforth they were to be the co-lords of the Sherqawa (E, decree of 20 October 1901 / 7 Rejeb 1319). The timing of the announcement, just after the fall festival in which tribesmen massed in Boujad, avoided confrontation with the Makhzen. The sultan also detained Sid 1-Hajj 1-Hasan in Marrakesh for several months, enabling his rival, Sid 1-Hajj Muhammed, to consolidate his position. Henceforth the two rival groups of descendants (and clients) of Sidi ben Dawd were known as the 'Arbawi Sherqawa and the Zawya Sherqawa. The first were so named because their core consisted of descendants of Sid 1-Hajj l-'Arbi (2–9) and those who stressed close ties with them. The Zawya Sherqawa, led initially by Sid l-Hajj Muhammed, were so named because after 1901 they assumed control of the house (3–5) of Sidi ben Dawd, at which pilgrims were traditionally received. The whole quarter was, and is, known as the Zawya quarter. Although the minor personnel of these two factions could on occasion shift loyalties, their leaders were locked into positions that limited their room for sudden reversals.

The Makhzen's divisive move was successful. For years, the proponents of both factions

were engaged in bitter struggles over property rights and worked to draw clients away from each other. The Zawya Sherqawa were the weaker faction in terms of popular legitimacy; hence, they were more dependent upon the Makhzen for support. In 1907, the contest became even more bitter when a brother of Sultan Mulay ʻAbd l-ʻAziz, Mulay Hafed, rebelled and was recognized as sultan in Marrakesh, Fes, and the Middle Atlas Mountains. This major national movement had significant local repercussions. The ʻArbawi faction swore allegiance to Mulay Hafed. After a short interval the ʻArbawi lord was rewarded with a royal decree from Mulay Hafed declaring him the exclusive lord of the Sherqawa.

In effect, each of the two Sherqawi factions now controlled regional appointments for the sultans they respectively recognized. It was not uncommon for two rival qaid-s to be appointed over the same tribe. Alliances and loyalties rapidly dissolved into short-term strategic maneuvers. The Zawya Sherqawa, anxious over the loss of support for ʻAbd l-ʻAziz, intensified their ties with the French. They became the main conduit of French intelligence for the upper Tadla Plain and for several years managed to convince the French that the members of the rival faction were merely “malcontents” with no real following. At first, the French saw this alliance as useful in providing intelligence and influencing events in western Morocco. Sid 1-Hajj Muhammed was even accorded a consular Patent of Protection in 1910, exempting him from direct Makhzen authority. The French tended to accept the Zawya Sherqawa accounts of the nature of their “traditional” influence but gradually found that the Zawya lord did not possess the sort of firm political control over his clients that the French were led to expect, or even absolute control over the Sher- qawi lodge. But even in the light of direct evidence of the strength of the rival ʻArbawi faction, which accompanied a punitive military expedition in 1910, the French continued to regard the Zawya lord as the sole legitimate one.

As the French consolidated their hold over the Shawya, they increasingly regarded their reliance upon the Sherqawa and other marabouts as unnecessary. Gradually, the Sherqawa and other marabouts were denied certain prerogatives previously accorded them, including exemption from taxes and corvee labor for themselves and their clients. The French intended to separate what they considered “spiritual” from “temporal” power. The Sherqawa no longer were consulted on 7«z7/-ships in the Shawya, although in the first months of the protectorate Sid 1-Hajj Muhammed was still consulted on appointments of qaid-s for the upper Tadla Plain. After 1912, in recognition of their services as “friends of France,” the French gave the sinecure of qadi, or religious judge, to the ʻArbawi lord and that of qaid of Boujad to the Zawya lord. But in these offices they were treated the same as other local functionaries elsewhere in Morocco and no longer were called upon as marabouts to settle tribal disputes or other matters. The result, quickly perceived by their maraboutic clients, was a de facto secularization that later will be discussed at length.

*** Maraboutic Islam in the Nineteenth Century

Until now I have said relatively little about the popular religious beliefs that were at the base of Sherqawi prestige. It is clear that the Sherqawa and other prominent maraboutic groups enjoyed recognition and acceptance among all elements of Moroccan society, from the tribesmen of the Middle Atlas Mountains or the upper Tadla Plain to the sultan and his entourage (Doutte 1903:314–327). The prestige of marabouts was not confined to tribesmen. By the nineteenth century, the intellectual and scholarly activities of the zawya were on a much lower level than in earlier centuries. Foucauld reported that Sidi ben Dawd possessed an excellent but rarely consulted library. This is in accord with the report of the first Native Affairs officer in Boujad that after the death of Sid

l-‘Arbi in 1819, no Sher- qawi lord personally taught at the zawya, as had been the practice since the days of Sidi Mhammed Sherqi (Niegel 1913:291). Still, there were eighty students at the school (madrasa) connected with the zawya as late as 1908, supported by revenues from Sherqawi estates. The political disorders which followed reduced their numbers to fifteen, together with a single, non-Sherqawi teacher, by 1913 (Niegel 1913:292–293). Nonetheless, the prestige enjoyed by the Sherqawa for being living exemplars of the “maraboutic synthesis” of Islam—knowledge of the religious sciences, mysticism, the ability to convey God’s grace—remained intact. In correspondence, Sherqawi marabouts were addressed as sidna, “our lord.” In contemporary usage, this term is reserved exclusively for the king.

Throughout the nineteenth century and earlier, the difference between the “maraboutic synthesis” and the formal, “orthodox” teachings of Islam was recognized by religious scholars. As previously mentioned, foreign observers of Morocco in the late eighteenth and early nineteenth centuries reported interviews with marabouts and religious scholars who sharply distinguished between maraboutism and the formal tenets of Islam (Chenier 1788:179–191; Ali Bey 1816:48–49). Although these remarks were made to foreigners, there was anything but evangelical fervor in the efforts of such learned men toward popularizing a “proper” comprehension of Islam. This passivity toward maraboutism among religious scholars lasted well into the twentieth century and can be interpreted as reflecting the strength of maraboutism (Doutte 1903:319; Merad 1967).

Significantly, such scruples about maraboutism were invoked only in private and to foreigners. With the exception of Sultan Mulay Sli- man, the idea of maraboutism encountered few significant popular or public challengers. Maraboutism was nourished by a quasi-orthodox interpretation and legitimation. As already indicated, the sultan invested marabouts. The proclamation which invested Sidi ben Dawd in 1820 was much more explicit in attributing to him the “secret of his ancestors” than were proclamations for marabouts of the late nineteenth and early twentieth centuries. The later decrees only tersely conveyed the fact of investiture, but they were still issued as late as 1930. Maraboutic politics remained significant. Similarly, members of the urban-based religious elite kept in touch with their Sherqawi counterparts. To provide one instance at length, both Sidi ben Dawd and his son ‘Umar corresponded with ‘Arbi ben Sayh, a religious scholar (‘aleiri) in Sale. The undated correspondence between ‘Arbi ben Sayh and ‘Umar primarily concerns a theological discussion of how the hands should be positioned when making a request to God. Of more practical interest is a letter from Sayh to Sidi ben Dawd, requesting that an escort be provided for an associate of his (S, 20 November 1875 / 21 Shawwal 1292). The introductory section (isti’ar) praises Sidi ben Dawd in flawless Arabic prose as the eminence whose “light travels as far as the light of the sun, whose breath blows its bar aka over land and sea.” The marabout also is described as the point that mediates the formal religious sciences (al-ma’aref) with those known to the mystics (al-asrar) and that links his ancestors with his descendants in the transmission of these gifts. ‘Arbi ben Sayh also announces his intention of visiting Boujad before the end of the year. In a word, the letter affirms the continuing vitality of the maraboutic synthesis among all elements of the population.

There are other contemporary justifications of maraboutism by religious scholars. The Fassi scholar Muhammed al-Kittani in Salwat al-Anfas (1895) tried to demonstrate that a devotion to saints accorded perfectly with the letter of Islam, even if nothing was known of the saint. He argued that, even if a pilgrim got no profit from a visit to a saint, it would do him no harm (cited in Levi-Proven§al 1922:381–382). The same writer also wrote

of baraka on earth as causing “productivity and abundance of the means of the living” and being transmitted through saints. “Without [saints] the sky would not send rain, the earth would not cause its plants to grow, and calamity would pour upon the inhabitants of the earth” (cited by Abun- Nasr 1965:5–6).

The question remains as to what extent these implicit statements of religious ideology by a literate elite reflected more popular beliefs of, for instance, tribesmen who were clients to the Sherqawa. This is a difficult question, for, as I have shown, written sources are silent on many aspects of the popular concept of marabouts. The written sources that do exist, such as those cited above, suggest that there was no clear educated consensus in the nineteenth century of a “formal” Islam distinct from popular beliefs, such as was to begin to emerge by the 1920’s, at least for the literate urban intelligentsia. Hence, there was no sharp distinction between popular religious beliefs and those expressed by the literate elite. Fortunately, there is valuable confirmation in the form of correspondence (or drafts of correspondence) from Sherqawa (including Driss ben ‘Umar) with a faulty knowledge of written Arabic (S). Individuals trained in Arabic letters tend to substitute for concepts verbalized and understood by their contemporaries in colloquial Arabic those available from their repertoire of classical Arabic and its literature. This shift often alters meaning. Persons with imperfect knowledge of Arabic letters use colloquial Arabic more often and neglect to excise references to popular religious assumptions incompatible with the traditions of written, classical expression. Thus, one such letter from Driss bluntly stated to the tribal council (fma’a) of a specific group that their offering was insufficient and that their donation would have to be increased in order to have prayers said on their behalf. Another threatened a tribal council with a supernatural curse C«r) unless it saw to the return of sheep stolen from the herd of a Sherqawi marabout.

A second source of evidence is Foucauld’s brief description of Bou- jad. He states, accurately, that the Sherqawa are not a religious order (tariqa’) but a maraboutic descent group claiming descent from ‘Umar.[32] Foucauld writes that the principal marabout, Sidi ben Dawd, was the carrier of “special graces” which made his blessing “fertilize the earth and make herds prosper.” He further writes that the marabout’s blessing opened “the doors of Paradise for men and [assured] them of the intercession of ‘Umar (the Prophet’s Caliph) and all his saintly descendants on Judgement Day” (1939:122).

There are, of course, ethnographic accounts of maraboutism in the late nineteenth and early twentieth centuries. Taken by themselves these accounts, like the material of this chapter, serve more to suggest the importance of marabouts than to present and analyze the beliefs which sustained them in their influence over most elements of Moroccan society. Outstanding among these accounts is Edward Wes- termarck’s massive Ritual and Belief in Morocco (1926), based upon fieldwork initiated several decades earlier and reflecting a careful reading of other ethnographers, especially Edmond Doutte. Unfortunately, Westermarck’s chapters devoted to magic, supernatural compulsion (‘«r), baraka, sacred groves, genies (/mrz), the seasons, and other topics are ordered by an external scheme which by its itemistic association of data does not attempt to elicit the underlying framework of Moroccan beliefs or place them in a specific historical context. It is clear that Westermarck was an extremely talented ethnographer. One constantly regrets that he lacked a concept of culture as an interrelated set of symbols and meanings.

Westermarck conveyed an image of a world in which the supernatural was all-pervasive. Signs of supernatural intervention were everywhere and capable of interpretation by

residents of any given locality. Rocks, trees, springs, the memory of uncanny events, maraboutic shrines, the gestures of daily life—all were part of a coherent, largely unquestioned way of looking at the world. Marabouts, at least in the form represented by the Sherqawa, provided concrete links between local, manifest representations of the supernatural and more universalistic patterns of Islamic belief. Even the pilgrimage to Mecca, symbolic of involvement with the wider Muslim world, seems to have been confined largely to the Sherqawa on the upper Tadla Plain. For some, the Sherqawa to this day are thought to provide a link with a more universalistic pattern of Islam, although this pattern of belief is rarely taken for granted as it was in the nineteenth century and at the time of Westermarck's research.

I am aware that the above brief description, which I have based as rigorously as possible upon documentation contemporary to the nineteenth and early twentieth centuries, leaves many lacunae. In one way, these sharpen the value of the extant evidence. To render intelligible the evidence for the nineteenth century, I have had to develop implicitly a set of working assumptions, or at least expectations, as to the shape of religious belief and ritual in particular social and temporal contexts. These assumptions do not spring out of a void. From an analysis of maraboutism in its contemporary context and an attempt to comprehend the fundamental assumptions which Moroccans now make about social reality, one develops a sense of expectation of what is crucial or often absent in evidence concerning earlier periods. This is not to assume blindly that the perceptions of reality of contemporary Moroccans have been identical over the period of a century or more. Rather, the careful examination of such perceptions serves as a sort of first approximation. Although my discussion of the nineteenth century comes before my discussion of the present, large parts of it were necessarily thought out only after considerable immersion in the contemporary aspects of maraboutic Islam. But in examining the contemporary role of marabouts, it became clear that something was missing, that what I saw were fragments of a pattern of beliefs, once solid, that was beginning to crumble. This idea was reinforced as I worked with informants capable of detailed recollections of past events and with manuscript correspondence. Soon I found it convenient to think of both past and present simultaneously, as it were, to make sense of various patterns of activity.

This approach to understanding the past—and the present—is not entirely an artificial strategem, although as a social anthropologist I have been concerned with making these assumptions much more explicit than a Moroccan (or anyone else, for that matter) would ordinarily find a need to do. It is the same means by which Moroccans, with varying degrees of interest and accuracy, also construe the past, whether the past in question is their personal, lived experience or a more distant past, such as that discussed in this chapter. Educated Moroccans have a sharp sense of historical transformations and present elaborate accounts of what marabouts were and how they became what they are today. Even tribesmen who maintain a firm belief in marabouts are aware that marabouts and their descendants play a different role today than they did in the past.

In the ensuing chapters, my discussion deals mostly with the present. My first concern is to describe how Moroccans conceive the social world. This description and the analysis of maraboutic Islam are largely complementary; hence the following three chapters are meant to do more than merely provide the social and cultural context for the explicitly religious issues of Chapters 6–8. Moroccan understandings of the nature of the social world are not a static backdrop but are themselves profoundly affected by changing patterns of religious belief.

** 3. Boujad: The Town and Its Region

*** The Town and the Rural Economy

Boujad's immediate hinterland is relatively homogeneous. The tribesmen of the region continue to follow genres de vie combining pastoral transhumancy, primarily of sheep and goats, with the extensive, seasonal cultivation of barley (zra') and hard wheat (gemh). The complementary ecological zones of the Boujad region are ideal for this mix. The mountains and their forested foothills (ghaba') serve as winter pastures, while the plains, after the harvest in late May or early June, provide forage throughout most of the summer.

The only exceptions to this overall pattern of land use are isolated patches of irrigated gardens and orchards. Prior to the protectorate, these were almost exclusively owned by Sherqawi marabouts, although many holdings have since been sold. In many cases they continue to be cultivated by descendants of former Sherqawi slaves. There are also occasional signs of French-inspired agricultural and pastoral innovations, confined almost exclusively to the lands of exprotectorate qaid-s and other wealthy individuals. The French innovations date principally from the 1930's, when efforts were made to introduce soft wheat as a cash crop. Its expense and greater risk than traditional, hardier crops in an uncertain climate discouraged its widespread adoption. Cattle raising was also encouraged, but the large amount of capital involved in comparison to sheep raising and the greater potential loss in case of disaster limited it to a peripheral role in the rural economy of the region.

The economic activities of both townsmen and tribesmen are directly affected by vicissitudes of the climate. The most significant divisions of the year are between winter (shta, literally "rain") and summer (sif). Spring (rbi') and autumn (khrif) are locally perceived as transient intercalations of the other seasons. Rains generally begin in late October and mark the onset of winter. Tribesmen try to sow their crops immediately before this period, although predicting the onset of winter involves a high element of chance. Rains fall most heavily in December and January, then gradually ease through March, when they almost entirely cease. The harvests in early June mark the return of transhumant herds to their summer pastures. The onset of each of these seasons is marked principally by the social activities associated with its typical climatic conditions, not by any fixed calendar. The most significant temporal marker is the annual festival (jnusem) of Sidi Mhammed Sherqi, during which tribesmen make a pilgrimage (zyara) to Boujad to reaffirm their ties with the Sherqawa. Significantly, this celebration is tied with the annual pastoral cycle. Its timing depends upon the movement of transhumant tribal groups to their winter pastures and varies for each group. Even groups no longer transhumant continue to follow the same pattern. The lunar Muslim calendar figures in none of the activities associated with the Sherqawa.

Abrupt climatic variations constitute one of the significant factors which have always made agricultural and pastoral activities precarious in this region and throughout much of Morocco. Tribesmen see these fluctuations in terms of seven-year cycles, the content of which cannot, however, be regularly predicted. (Marabouts and miracles also frequently come in sevens, here as elsewhere in the Middle East; so use of the number should not be

taken as an effort toward empirical measurement.) Many tribesmen often attribute such abrupt seasonal and microecological variations in the weather to maraboutic intervention. Winters on the Tadla Plain[33] are relatively temperate: the average temperature is 3–7° C. (38–45° F.) in the coldest months, with only rare incidence of frost and none of snow. Summers are extremely hot, with the temperature frequently as high as 40° C. (104° F.). Precipitation records for the Tadla Plain indicate average annual variations between 286 and 480 millimeters, falling on 34 to 55 days annually (Gaussen, Debrach, and Joly, 1958). The other major factor affecting agricultural and herding activities, particularly since the protectorate, has been the fluctuating but increasingly unfavorable market conditions for traditional cultivators (M. Nasiri 1969). Each year tribesmen try to adjust their herding and agricultural activities to anticipated economic and climatic conditions, but the extreme annual variations of both make this exceedingly difficult.

The rural economy of the Boujad region can be characterized as “traditional,” although what is traditional must be considered in a temporal framework. The economic and political transformations engendered by the protectorate are particularly significant. Prior to the protectorate the pattern of transhumant pastoralism and seasonal cultivation outlined above prevailed over most of the Tadla, Shawya, and Dukkala plains (Foucauld 1939:117; Mission Scientifique du Maroc 1915:1, II). With the exception of Boujad’s immediate hinterland and a few other isolated regions, the traditional genres de vie have been directly overshadowed in most regions by the modern economic activities introduced by the protectorate. Boujadi-s say that a sign of the divine grace (baraka) of Sidi Mhammed Sherqi is that he chose to settle in a region devoid of economic interest to the French. Colons (French colonists) avoided the region, primarily because the soils of the Tadla Plain north of the Umm er-Rbi‘ are thin, calciferous, and easily eroded by intensive cultivation. Outside of a settlement at Wad Zem and a few other centers, there was minimal rural colonization on the northern half of the Tadla Plain.

There was a significant nonagricultural European presence not far from Boujad. About twenty-five kilometers to its north, phosphate deposits were discovered immediately prior to the protectorate; exploitation began in earnest toward the end of the First World War, mostly on the basis of corvee labor. A narrow-gauge military railroad was completed to Khuribga and Wad Zem in 1918 and by 1928 was converted to standard gauge. Wad Zem, twenty kilometers northwest of Boujad, initially became the center of mining activities. By the 1920’s it was replaced by Khuribga, roughly twice the distance from Boujad. To prevent the dislocation of the local European (predominantly Spanish) population of Wad Zem, the protectorate administration allotted agricultural lands to unemployed miners. These and other efforts to expand the lands under colonization, notably an attempt in the late 1920’s to establish a large commercial ranch in the region, encountered determined and effective hostility from the surrounding Sma‘la tribesmen. The ranch, to be located on expropriated tribal lands, was described in the conventional language of the period as a valuable “educational” experience for the tribesmen. Local officials feared a major tribal uprising and successfully advised against the enterprise and any other major expansion of colon holdings (Bonjean 1928:78) [34] In 1928 colons formed a Comite Regional d’Etudes Eco- nomiques (Regional Committee of Economic Studies) to further colonization on the Tadla Plain, but most of its effective activity was to the south of the Umm er-Rbi‘. Nothing came of the efforts of the delegation from Boujad—a Portuguese bar owner, a Polish truck driver, and a Greek grocer—to attract further colons.

In contrast, the rich, alluvial soils south of the Umm er-Rbi‘ River attracted a large number of settlers (Gadille 1958:18), especially after major irrigation schemes were implemented in the 1930’s. Although for over a decade Europeans were the principal beneficiaries of these

projects, by the end of the Second World War Moroccans also began to benefit on a large scale. The French intended to break the “undesirable” economic habits of traditional agriculture with technical assistance, making “the native’s way of living move as fast as the tractor” (Berque and Couleau 1946:18–25). Tribesmen often resisted these schemes because the authoritarian methods by which they were undertaken and technical errors made for several major failures. Nevertheless there were initial successes in introducing new agricultural techniques to Moroccans in some areas, but these were rapidly dissipated by stiff, decisive opposition from colons and certain pro-co/on protectorate officials (Julien 1972:308–310).

These various economic transformations significantly affected even peripheral regions, such as Boujad and its hinterland. Prior to and during the earliest years of the protectorate, virtually all tribesmen lived the entire year in tents (Foucauld 1939:117, 121). The spread of mining activities and agricultural colonization, coupled with administrative restrictions on transhumant movements and the use of forest lands for grazing, resulted by the late 1920’s in a significant trend toward sedentarization (Bonjean 1928:86) and a marked decline in the number of livestock in the region (see Fig. 5). For most of the year tribesmen now live in stone and wattle huts (nwala-s). The wealthiest live in stone or concrete dwellings. Since sedentarization occurred only after imposition of the Pax Gallica, dwellings are not clustered into villages as they generally are in the older settled regions of Morocco, but are located on individual landholdings. Tribesmen continue to live in tents only during the winter transhumant moves.

[[d-f-dale-f-eickelman-moroccan-islam-21.png][Figure 5. Livestock in the Boujad region, 1928–1968. (Based on Kingdom of Morocco, Ministry of Finance, Circle of Wad Zem, 1951–1968; B.)]]

^a Figures not available for 1961 and 1963.

A rough index of the economic stagnation of the region is the slow rate of rural population growth over the last seventy years. Elsewhere on the Tadla Plain, the rural population has doubled from an estimated range of seventeen to twenty-six persons per square kilometer around 1900 to roughly thirty-six to fifty-five at the present. That of Boujad’s immediate hinterland remains in the range of seventeen to twenty-six (Noin 1970:1, 80, 91, 251).

The “stabilization” of Boujad’s hinterland had a direct impact on Boujad. The vast economic and political hinterland which Boujad possessed prior to the protectorate rapidly contracted. After 1912, the town no longer served as a major caravan entrepot for the interior plains of western Morocco and the Middle Atlas Mountains. While the Sherqawa of Boujad continued to receive substantial donations from pilgrims throughout the religious hinterland of western Morocco, the remainder of the town’s effective economic base rapidly contracted to its immediate, disfavored environs

Nevertheless, Boujad as well as other settlements in the interior of Morocco enjoyed a marked population growth at the onset of the protectorate. This quickly leveled off, despite the continued influx of immigrants from surrounding rural areas.[35] Of all the settlements on the upper Tadla Plain, Boujad has experienced the least growth. As a consequence, younger Boujadi-s tend to emigrate, given the real and imagined possibilities for work and the attractions of “bright lights” of the more dynamic coastal towns and nearby Khuribga.

Older Bou- jadi merchants and men of influence who initially concentrated their energies and investments in Boujad and its region have shifted their activities as far as possible to such cities as Casablanca and the prosperous, irrigated plains of the nearby Bni Mellal region.

Other towns in the region, some little more than weekly markets prior to the protectorate, became the major beneficiaries of the economic rationalization introduced by the French. In addition to Wad Zem and Khuribga, previously discussed, Fqih ben Saleh and Bni Mellal emerged as market and administrative centers for a vast irrigation scheme, to which sugar refineries and associated industries have recently been added. Qasba Tadla, little more than a ruined fortress in the latter half of the nineteenth century (Foucauld 1939: 139–140), regained life as a major military post early in the protectorate.

*** Boujad: Its Organizational Frameworks

There are four major organizational frameworks through which an outsider can begin to discern the internal ordering of the town: spatial, economic, religious, and administrative. Taken together, their value is in giving a concrete configuration of the town's major activities. To a certain extent these are also meaningful frameworks to Boujadi-s themselves. I qualify the extent to which they are meaningful "native" categories because there is a simpler, more basic set of assumptions which Boujadi-s make about the social order and which cut through the organizational frameworks presented here. Thus, in the following chapter I will present and analyze one aspect of spatial organization, the quarter system, in much more detail in order to make visible the relation between it and the more basic assumptions which are made about the social order.

Table 1.

Population of Boujad, 1883–1970

Year	Total	Jews	Europeans
1883	1,700	200	0
1913	4,000–7,000	400–500	^a
1926	8,879	1,010	138
1936	10,211	^a	158
1951–1952	11,389	^a	^a
1956	^a	336	53
1960	14,728	80^b	^a
1970	18,000 (est.)	2	17

One thing that I want to stress throughout the primarily ethnographic presentation of this chapter is the lack of clearly defined social roles in relation to formal economic, religious, and governmental institutions. That is, knowledge of a person’s occupation, descent, or other formal statuses in itself says very little about how he normatively conducts himself in reference to other persons in society. S. F. Nadel specifies that “true” roles always entail a “halo effect.” For instance, being a bureaucrat entails a significant set of “further characteristics” which hold for a variety of situational settings (Nadel 1957:28). In Morocco, knowledge that someone is a shopkeeper, government employee, or the like does not in itself give significant cues as to the role the person plays in society. This is not to argue that such formal institutions as the governmental apparatus, the “offices” provided by the mosque, the Qur’anic schools, or the economic institutions which I shall describe in this chapter are unimportant. These merely constitute components of wider fields in which particular activities—economic, political, religious—are carried out. Social action is played out between total social persons, making it difficult to conceive of persons solely or even predominantly in relation to sets of formal institutions, as is common in our own society.

Space

From a distance Boujad resembles an oasis, flanked on its western side by orchards, groves, and gardens. These yield a rich array of dates, nuts, carrots, cucumbers, olives, pears, and pomegranates. In recent decades many of those toward the north have been cleared for housing, although most toward the south remain intact. On its eastern fringe, Boujad is bordered by a rocky, barren plateau almost totally devoid of vegetation. Although in the sixteenth century Boujad was reportedly in the midst of a forest (one grove of trees, locally considered sacred, still remains), by the 1880's firewood had to be carried from the foothills of the Middle Atlas Mountains, nearly ten kilometers away at the closest point (Foucauld 1939:119).

The town possesses a certain beauty. Viewed from the west, its whitewashed buildings are framed in the background by the peaks of the Middle Atlas Mountains. This gleaming whiteness contrasts dramatically with the rectangular, emerald-green tiles of the domes of the major Sherqawi shrines. The major colonial contribution to this image was to enclose the main market (suq) on three sides with a profusion of arcades, each of which forms a portal to a merchant's stall (hanut). These were designed in the late 1920's by a French Native Affairs officer (officier des Affaires Indigenes), who was inspired by a photograph of the arcades surrounding the Ka'aba at Mecca. Since Boujad is also a pilgrimage center, he felt it appropriate that it replicate the Ka'aba. Strictly speaking, tribesmen and Bou- jadi-s distinguish between the pilgrimage (hajj) to Mecca, made during a specified season during each year, and "visits" (zyara-s) made to the shrines of marabouts.[36] The analogy with Mecca which inspired the arcades was one of the many colonial neologisms which with varying intensity affected the roles which Sherqawi marabouts were enabled to play in society. Nevertheless, construction of the arcades presumably improved the view of Boujad from the Bureau des Renseignements (Intelligence Office; now the offices of Boujad's qaid), located on a small promontory on the other side of the market (see Fig. 6).

Unlike most traditional Moroccan towns, the older part of Boujad is not enclosed by a defensive wall. Sherqawi baraka was considered sufficient protection from surrounding tribes, almost all of which are clients of the Sherqawa. Despite the lack of a wall, the oldest traditional part of town (medina) is sharply defined by the vestiges of portals to its interior passageways—the last of the actual gates was removed in 1965. These gates and the walls of the outermost houses allowed the town as a whole and each of its quarters (derb-s)[37] to be sealed off at night.

Much of the medina proper, particularly toward the north and east, dates from the beginning of the protectorate. Its outer limits are clearly defined, but no obvious pattern governs its internal labyrinth of narrow, winding streets, many of which are blind alleys. Most of these passageways, too narrow for cars, are generally cluttered with pedestrians, donkeys, handcarts, mules, merchandise, and children shouting and playing. In the somewhat less hectic residential quarters, women perform such household chores as drying grains on the side of the street and discreetly, or so they hope, gossip with their neighbors.

To a European, the overall impression is one of total confusion, since there is no generalizing principle which allows one to get from one place to another on the basis of abstract criteria. One only knows how to get from one point to another by having gone there before. Despite the modest size of the town, even Boujadi-s sometimes get lost in

unfamiliar quarters. Similarly, the facades of houses in the medina give few clues to the prestige or wealth of their inhabitants. Most of the buildings are rectangular, whitewashed structures, commonly two stories high, with no open space between them. Houses open on the street only by narrow entranceways and occasionally by small, iron-grilled windows on the upper stories. From the street, only a few of the most substantial mosques and shrines are distinguishable from other buildings, either by ornate entranceways or by open doors revealing their interiors. Distinctions of wealth and prestige become evident only within the concealed interiors of most houses. Wealthy ones often have open courtyards with fountains and gardens; poorer households have only a cramped, rectangular patch of concrete with a narrow shaft for air and frequently evince varying stages of decay and disrepair.

Despite its minimal European population, the influence of the colonial experience on the overall spatial organization of Boujad is substantial. In the late 1920's and early 1930's, the protectorate's Service de 1'Urbanisme (Urban Planning Service) developed plans for virtually every Moroccan town, including Boujad. Each town was explicitly divided into zones for "traditional" Moroccans, "evolved" Moroccans, and Europeans. Each zone was presumed to conform to the "mentality" of certain elements of the population. Thus the traditional medina was left virtually as it was, except for the eventual provision of sewers, water, and electricity.

To the west of the market, the limits of what was meant to have been Boujad's European sector are defined by a park, garden, tennis court, and swimming pool. Since only a handful of Europeans not connected with the administration ever lived in Boujad, the core of this sector retnains the Bureau des Renseignements (Ar. biru) , constructed in 1929. This building still houses most of the administrative and judicial functions of the central government. It also served as the personal quarters for Bouj ad's military Native Affairs officer until 1933. Military control gave way to civilian in that year, so that a succession of controleurs civils were lodged there until independence in 1956, when they, in their turn, were replaced by Moroccan qaid-s appointed from outside the region. Adjoining villas house the medical officer, public-works chief, and schoolteachers. Secondary schoolteachers and their families constitute the only remaining Europeans. On the principal highway behind this array of buildings are a gendarme post, a filling station, a bar-restaurant-hotel which serves as the town's roadhouse, and a soccer field, originally a landing-strip. A few buildings, mostly schools, have been added to this sector in recent years, but, as in the colonial period, only "outsiders"—non-Boujadi-s —live in it.

The third main provision in the 1931 urbanization plan was for a native housing project called New Boujad (Bja'd J did). This was initially intended to house the "evolved" Muslim bourgeoisie of the town. The streets in this zone are laid out in a monotonous rectangular grid. Houses at its core, dating from the early 1930's, follow elaborate specifications of design and material laid down by the French. This carefully regulated urbanization was progressively engulfed by adjacent, less controlled zones of growth in which governmental intervention was limited to insistence on maintaining the original rectangular pattern of the "new" town. Since the French tried to discourage immigration from rural areas in the latter years of the protectorate, much of this housing dates from the last two decades. The first years after independence saw a rapid, almost disorderly growth, followed by a period in which the former French policy of discouraging rural emigration was tacitly reintroduced and, since 1971 (as a consequence of the political climate?), again abandoned. In general, however, the main outlines of the colonial conception of forty years ago have remained intact.

The Economy

The major towns of the Tadla Plain—Boujad, Qasba Tadla, Wad Zem, Fqih ben Saleh, Khuribga, and Bni Mellal—are all linked in a series of rotating markets. A market is held in each town of the cycle on one day of the week. In turn, each of these towns forms part of a cycle of smaller rural markets which rotates around the larger one. In principle, markets are not held on Fridays, the day the weekly sermon (khotba) is given to the congregation in the mosques. Nevertheless, there are at least two small rural markets on the upper Tadla Plain which are exceptions to this pattern. Tribal informants claim that once there were more Friday markets but that they were actively discouraged during the rise of mass nationalism after the Second World War.

On Thursday, its market day, Boujad's population more than trebles. The buses and trucks which carry professional traders begin arriving before dawn. Some tribesmen arrive the night before, although most appear only on the market day itself. Other buses and trucks circulate throughout the region, collecting tribesmen and the animals and crops they wish to bring to market. Funduq-s—caravanserais in classical Arabic but empirically better described as market-day stables which also serve as storage depots, lodging for the town's neardestitute, and, occasionally, brothels—are packed with tribesmen and their animals. Similarly the nine public baths (hammams') and the major Sherqawi shrines are crowded with tribesmen.

Boujad's merchants do most of their business on market day. Similarly, the religious and civil courts have their weekly sessions, and the qaid hears reports from and gives orders to the government- appointed shaykhs and mqaddems responsible for tribal groups and listens to tribesmen's complaints (shikayas) and petitions. The medical clinic works to capacity, and the post office cashes money orders from overseas, distributes military pensions, and passes on to government shaykhs the handful of correspondence which arrives for the rural areas.

Prior to the protectorate the entire market was held in the large open area in front of the shrine of Sidi Mhammed Sherqi. As mentioned in Chapter 2, Sherqawi marabouts collected the firearms of the tribesmen and held them until the conclusion of the market. This custodial activity ceased once the protectorate was effectively established in the area. Despite a few modifications introduced by the protectorate administration, the principle by which the market is organized remains that of competitive settlement, as throughout most of the Middle East.[38] In other words, all sellers offering similar goods or services—vegetables, spices, used tin cans, jewels, small utensils, ready-made clothes, blankets, chickens, haircuts and shaves, and so on—are grouped together in the market.

Virtually every household in the town gets caught up in the market as buyer or seller, and generally as both. In the course of the day many people shift between the two roles. Sellers can be ranged along a continuum from full-time professionals who make the rounds of markets to those who only occasionally have animals, crops, or other goods to sell. The quantity of such goods is often minute. For example, a woman might wait all morning to sell half a dozen eggs and use the proceeds to make minor purchases later in the day. Similarly, the retainer of a prestigious family, who receives only meals for his services, gets cash by purchasing small quantities of fruits wholesale before dawn, as they arrive by truck in Boujad. Later in the day he sells them at a slightly higher price. The minute capital he needs is provided by one of the wholesalers, who thus secures the man as his client.

Townsmen, especially those with capital to invest, take as active an interest as tribesmen in the livestock market.[39] Many have jointventure arrangements (shorka-s) with tribesmen. These agreements are representative of the complex dyadic bonds which hold together most of the economy and the rest of society in that they are rarely- based on economic considerations alone. To ensure mutual confidence, such partners are generally linked by multiple bonds, including ties of kinship and patron-client relations. Typically, the townsman puts up part of the capital for a herd. Annually, his share of the profit (rebh) is mutually agreed upon with his tribal partner (sahelT). The division varies primarily by such factors as the skill and reputation of the tribesman and some of the noncontractual benefits of patronage which the townsman may be thought to offer.

Since more lucrative opportunities for major capital investment can now be found in other regions of Morocco, pastoral agreements are at present generally preferred only by townsmen with moderate amounts of capital who do not have the prestige or resources to oversee and defend investments in more distant regions. This has contributed to a further decline in the region’s rural economy.

Apart from herding agreements and similar arrangements which some townsmen have for the provision of grains for their household, the tie between buyers and sellers at the Thursday market tends to be exclusively economic, with a tendency to purchase only at the most advantageous price. This holds at least for those who can make cash purchases. In contrast, shopkeepers in Boujad maintain fairly stable and complex dyadic ties with their clientele, sustained by the judicious use of credit. The advantages of extended credit and other noneconomic considerations outweigh the slightly higher prices which most of these merchants charge.

Commercial and craft activities are more complex than can be assumed by the uniform appearance of most of the shops. In 1970 there were 838 craftsmen and merchants, grouped into forty-two distinct crafts and twenty-six distinct mercantile specializations, such as butchers, spicers, vegetable-sellers, salt-packers, tailors, weavers, barbers, bellowsmakers, locksmiths, carpenters, cloth merchants, and those who “buy and sell” u-shri) virtually anything of value, usually in minute quantities, often literally pinches of produce.

The handful of European merchants who were in Boujad during the protectorate left soon after independence. European enterprises included a cafe-hotel on the main road, a bus and truck service which ran to local markets, a grocery and dry-goods store which catered primarily to Europeans, a garage, and a small cement factory. All of these businesses were purchased by Boujadi Muslims after 1956, although virtually none has been subject to any further capital investment. Similarly, Jewish shops were purchased by Muslim merchants or left to Muslim apprentices in the years immediately after independence. How these various enterprises were disposed of depended on the particular circumstances of each trade. Thus the stocks of the itinerant cloth traders were largely taken over by rural Qur’anic teachers (/z/zTz-s), who used their close ties to and familiarity with the rural hinterland to their advantage.

Boujad never was a significant craft center. Even at the beginning of the protectorate, craft activities were characterized as ailing; most processed or manufactured goods came from

the coastal cities (Cimetiere 1913:285). Certain crafts enjoyed a temporary renaissance during the Second World War, when European goods were unavailable. Local shoemakers and tailors worked for the Vichy French and later the Allied forces. Otherwise, administrative reports throughout the protectorate reiterate the irreversible decline of most of the crafts. The ready postwar availability of superior manufactured goods, such as cheap, waterproof plastic shoes and ready-made or second-hand clothing, quickly cut the market for the locally made products of shoemakers and weavers. Only carpentry continues to thrive. The low cost of labor in Boujad encourages many coastal firms to contract piecework to Boujad.

Boujad's shops range from large depots (7zrz-s) owned by the town's nine major merchants to the more common merchants' stalls (Jianut-s), often only six feet wide and not much deeper. The most substantial of these merchants are known as "traders" (tajer-s) and generally deal in a wide variety of commodities; those with more limited capital are generally known by the commodity they sell, such as "charcoal-seller" (fekhkhar).

Very few shops are the result of cooperative ventures. In general, men avoid as far as possible situations in which they share responsibility as equals with others or in which they are subordinate to someone else. This preference cuts through all social activities and will be discussed at length in Chapter 5. Each merchant and craftsman tends to work for his own account, although a few acquire venture capital from close relatives and other individuals who have confidence in them.

The organization of merchants and craftsmen into "guilds" (hanta-s) does not constitute an exception to this tendency toward personal authority. In Boujad, the formal organization of guilds is a French administrative imposition of the 1920's rather than a preexisting form of corporate activity. Even the orientalist Louis Mas- signon, who asserted that craft and mercantile "guilds" were the institutional cement of Muslim cities, found little evidence for his contention in Morocco, the only country in which he essayed a sociological inquiry into the subject. In particular he singled out Boujad as the clearest representation of the "primitive" form of Moroccan guild, superficially Islamicized but still essentially "Berber," since there was no formal pattern of leadership. Decisions in each craft or trade were reached by informal consensus; "guilds" were not corporate organizations that had an existence independent of individuals (Massignon 1924:62). Although the forms of craft and mercantile organization in the larger cities of Morocco also failed to support his thesis that Islamic guilds were corporate, he explained this away by claiming that they too evidenced only superficially Islamic forms (1924:139). This strategy of assuming pre-existing societal forms to explain away inconsistencies between observed ethnographic reality and presuppositions concerning Islamic society is, of course, the same as that used by Bel.

There is no sharply ordered hierarchy of prestige between the various crafts and trades. Such a ranking is impossible, since all but the poorest merchants and craftsmen have many sources of income which are not reflected in the activities of their shop or craft. A

merchant who sells ready-made slippers (belgha-s) from Fes may have a minimal visible turnover of goods in his shop but derive substantial income from the rental of buildings and lands, speculation on the animal market, and other sources. Most merchants of rural origin similarly possess rights to land or produce which ensure them the basic foodstuffs needed for subsistence in town. Everyone tries to spread out his activities

to insure against the hazards of any single one. Thus occupation, taken in its common European sense, can be a very poor indicator of a person’s wealth or status.

Prestige is based primarily on the ranking of total social persons, not on the specific economic activities which they undertake. A few occupations, such as the dirty, nonlucrative work of tanning and potting, unequivocally signify low income and prestige, but this is not the case for most activities. Butchers, for example, are considered to be engaged in an unclean trade but often are considered more prestigious than schoolteachers and government clerks, since some are known to have more substantial incomes and higher life-styles. One of the few effective, though not determinant, general indicators of status is whether a merchant or craftsman is of urban or rural origin. Rural immigrants generally cluster in those activities which require the least capital, such as selling fruits or vegetables and “buying and selling.” Even in these cases, however, there are exceptions which Boujadi-s are quick to point out.

Religion

Most townsmen say that the formal complex of Islamic institutions centers around mosques, the Qur’anic schools (mesjid-s) generally associated with them, pious endowments established for the support of religious activities, and, finally, the religious court (l-mahkama dyal sh-shra^. Since the protectorate, the latter has been restricted to adjudicating law of personal status: marriages, divorces, inheritances, and certain land transactions.

This institutional complex is characterized as being shared in principle by all members of the Muslim community (umma). Many townsmen presently consider religious brotherhoods and the patterns of clientele associated with marabouts as being apart from the formal institutions because they are particularistic—their support comes only from a designated membership or clientele. Such views have become widespread only since the 1920’s. Most tribesmen and many older Boujadi-s make no such distinction.

Table 3.

Economic rank of Boujad’s merchants and craftsmen correlated with place of birth

Economic Rank	Place of Birth	Other (%)	N	Total (%)	N
Boujad	Boujad’s Rural Hinterland				
(%)	N	(%)	N		
Low	69.5	388	90.4	189	40.5	17	73.2	594
Medium	22.9	128	9.1	19	42.9	18	20.4	165
High	7.9	44	0.5	1	16.7	7	6.4	52
Total	69.1	560	25.8	209	5.2	42	100.0	811

Note: This table is based on an economic census of shopkeepers and craftsmen which I conducted in 1970. Economic rank was a judgment of informants.

Boujad has two principal mosques in which the Friday sermon is given by a prayer-leader (imam) before the assembled congregation. The older of these mosques was built by Sultan Mulay Sliman in 1805 (see Fig. 6). The communal sacrifices of the Little Feast ('Id le-Ftur), which marks the end of Ramadan, the month of fastings and the Great Feast ('Id le-Kbir), or Feast of Abraham, are held in it when the weather does not permit their being held at the communal prayer-ground (msalla) located on the eastern edge of the town. A second major mosque was completed in early 1973 but was already in use two years earlier. It is located on the northwestern edge of the medina, next to New Boujad. Once finished, this mosque began receiving formal support from the Ministry of Pious Endowments. But its construction was financed locally, primarily by wealthy non-Sherqawi merchants and a few Sherqawa. One of the latter is a leading local politician who received no substantial support from other Sherqawa in elections in the early 1960's. Consequently, he allied himself with his non-Sherqawi supporters and became prayer-leader of the new mosque.

The two principal mosques and many of the others associated with residential quarters have personnel regularly attached to them who receive stipends from the Ministry of Pious Endowments. Most of these are Qur'anic teachers (Jqih-s). Their meager official stipend is supplemented by monthly gifts in cash and produce from the parents of the children they teach and other gifts at the graduation of the children. Qur'anic teachers at smaller quarter mosques depend entirely upon such local donations and whatever annual amount is agreed upon with the household heads of the quarter. Other personnel who receive modest official stipends include a group of elderly men who each evening recite parts of the Qur'an at the mosque of Mulay Sliman, prayer-callers (mwedden-s) and the prayer-leaders of the two major mosques.

The funds for these stipends and for the maintenance of certain mosques and shrines of descendants of the Prophet Muhammed are distributed locally by a deputy overseer (na'ib) of the Ministry of Pious Endowments. This official, who also operates a cigarette shop, collects rents from the various properties held by his ministry. In Boujad these are limited almost exclusively to the merchants' stalls built into the outside walls of the larger mosques. Elsewhere in Morocco, particularly in the regions surrounding the major traditional cities, the Ministry of Pious Endowments has more substantial urban—and, until recently, rural—properties.[40] Prior to the protectorate and up to 1927 Boujad had an overseer (nadir) of pious endowments who was also a Sherqawi. In 1927 this office was shifted to Wad Zem, where a wealthy Sherqawi continued to hold the position; after independence the office again shifted and fell to a non-Sherqawi in Bni Mellal.

Finally, there are a small number of descendants of the Prophet (shorfa, sg., shrif) in Boujad who have a formal spokesman (naqib). They have no significant collective activities, although a certain prestige adheres to their descent. In the past various material benefits accrued to them as a result of it.

Except for the collective annual prayers on the two major feast days and the Friday gatherings in the principal mosques, there are no regular gatherings which symbolize the unity of the Muslim community. Of course, formal Islamic ideology has a profound effect on the daily and annual cycle of activities. Most adult male heads of households perform the

full cycle of five daily ritual prayers and regulate their activities in terms of these and other, more occasional, Islamic obligations. Nevertheless, formal religious organization does not inherently provide a vehicle for effective social action. Individuals, such as the politician-zm^m mentioned above, can utilize a religious office to legitimize their social honor and mobilize effective followings. But again it is the configuration of attributes possessed by persons, not any particular offices they might hold, which forms the key to understanding social action.

The most significant of the religious brotherhoods in Boujad are the Tijaniya, the Qadiriya, and the Kittaniya orders. When more active in the earlier half of the protectorate, the Tijaniya attracted mostly notaries and minor Makhzen officials; the other two orders had their greatest local appeal among moderately prosperous merchants and craftsmen. In principle, each brotherhood has a leader (mqad- deni) and a lodge (zawya) in Boujad. New recruits became scarce after the widening popularity of reformist ideas and the nationalist movement in the mid-1930's. The remaining adherents of these orders, who in no case currently exceed two dozen elderly men, gather each Friday afternoon after the midday prayer in their respective lodges or in each other's houses. There they recite the devotions associated with their particular order. On feast days their spokesman (mqaddem) takes the flag of their order to the house of the prayerleader of the town and breakfasts with him before they proceed together to the mosque or the communal prayer ground.

There are also disciples of the various ecstatic religious orders in Boujad—the Heddawa, Derqawa, Tssawa, and Hmadsha. These are considered by most townsmen to be much less reputable than the orders mentioned above. Their membership comes primarily from the urban Lumpenproletariat—beggars, charm sellers, some musicians, manual laborers, and the descendants of slaves. They gather at private houses, where they are often invited to perform exorcisms when possession by a malevolent jinn is suspected to be the cause of illness or misfortune. Only the Hmadsha have a zawya, attached to the shrine of the Sherqawi marabout Sidi 1-Hafyan, who is said to have been the mystic teacher of their founder, Sidi 'Ali ben Hamdush. The local Hmadsha often have their number augmented by pilgrims coming from elsewhere, especially during a small yearly festival (musem) attended only by members of the order.

The most significant complex of religious activities in Boujad, as measured by offerings, sacrifices, and the number of participants, consists of those centered around the Sherqawi shrines and the

Sherqawi religious lodge (zawya'). The latter is not a regular meeting place for clients of the Sherqawa, as are the lodges of religious brotherhoods. It is the residence of a Sherqawi who is considered by tribesmen to be a living marabout and who strives to cultivate this reputation by writing charms for supplicants and entertaining delegations of tribal clients.

Boujad has twenty-six marabou tic shrines, twenty-three of which are Sherqawi.[41] The most significant of these is that of Sidi Mhammed Sherqi. Associated with his shrine are those of several of his children, a mosque, and a recently completed hostel for pilgrims. The main shrine is lavishly, if crudely, adorned on its interior with mosaics, brass ornaments, large candles, hanging rugs, and a large collection of hand-wound European pendulum clocks. Substantial offerings are collected at this and the other principal shrines.

The remaining Sherqawi shrines are more modest, with relatively bare interiors, and doorkeepers (bewwab-s) present only on those days when there are enough visitors to make collection of their offerings worthwhile.

The largest influx of visitors and pilgrims comes in September and early October, during the festival (musem) of Sidi Mhammed Sherqi. Tribesmen in the immediate region of Boujad arrive on muleback and horseback with their tents. Groups from more distant regions, such as Shawya, now arrive by bus or truck. These visits are staggered over approximately a month, with the Sherqawa often arranging for antagonistic tribal groups not to be present at the same time. Each group stays for three or four days. In September 1969 approximately twenty-five thousand tribesmen came on pilgrimage during a two- week period in which I tried to make estimates of arrivals.[42] Moreover, the Sherqawa said that the number of pilgrims was somewhat attenuated that particular year because the qaid-s of several regions discouraged attendance. Formally, the qaid-s argued that the tribes under their jurisdiction were delinquent in their taxes and that the money that would ordinarily be spent on the musem should go instead to their taxes. However, tax arrears are a chronic problem in rural areas. Informally, the qaid-s utilized the tax-arrears argument primarily against those groups that indicated displeasure with the government candidates proposed for local elections to be held that year. Some officials thought that denying tribesmen participation in the musem would be particularly efficacious in breaking their resistance. In 1972 the same officials, again for political reasons, sought to encourage the festival but to link it to a show of loyalty to the government. The provincial governor made a substantial contribution at the principal shrine and local officials tried to obligate the tribes present to greet the governor ceremonially upon his arrival. Most refused, saying that they came to Boujad for the marabout Sidi Mhammed Sherqi, not for the Makhzen. Even the suggestion of reprisals did not alter their position. Provincial officials, reluctant to risk a major incident, dropped the matter that year, but achieved a compromise in 1973 by which tribesmen agreed publicly to greet the governor. These actions implicitly reflect the continuing strength of marabout- ism as a social force in rural Morocco.

The Makhzen

The contemporary Makhzen presence in Boujad has three foci—the local administrative bureaucracy, the courts, and the schools. Boujad was an administrative anomaly both during the protectorate and after independence. At present it is virtually the only annexe (melhaqa) in a national administrative apparatus which elsewhere begins at the higher level of cercle (da’ira). In the early protectorate, the entire Tadla Plain and part of the Middle Atlas Mountains were governed from Boujad, but it was soon relegated to a cercle, and finally to an annexe. Although the French progressively downgraded Boujad’s administrative significance, they retained it as an annexe because of the prestige they ascribed to the Sherqawa and the role of the Sherqawa as “friends” of France. As I mentioned in the last chapter, for the duration of the protectorate the town’s qaid-s were the marabouts of the Zawya Sherqawa. The marabouts of the other leading descent group, the ‘Arbawi Sherqawa, provided the qadi-s. Both qaid-s and qadi-s tended to pack the subordinate positions under their influence with their supporters, although, after several scandals in the 1930’s, the French began diluting Sherqawi hegemony over the subordinate local posts.

In 1913 the French briefly and unsuccessfully experimented with a Sherqawi qaid to administer the tribal hinterland. Four non-Sherqawi

qaid-s drawn from the tribes they administered or from neighboring tribes soon took his place. In the 1930’s the number of rural qaid-s was halved. All of these Officials were under—or, in the fiction of the protectorate, were advised by—a French controleur civil. All communications with the Makhzen and government agencies passed through the hands of the controleur, who thus ensured that the qaid-s under his supervision confined themselves to eminently local affairs.

Since independence a single qaid for both the town and the tribal hinterland, an outsider to the region appointed by the Ministry of the Interior, has assumed all of the duties of both controleur and qaid^ except for the judicial functions which these officials had during the protectorate. This qaid is directly or indirectly supported by a local bureaucratic presence which includes a clerical staff for himself and his assistant (khalifa’) and a paramilitary force of mokhazni-s. There are also various specialized services which he nominally coordinates: water and electricity offices, a gendarme post, a public-works office, a post office, and a medical dispensary, downgraded from a hospital in the early 1960’s. Although all local government officials and clerks are appointed from Rabat, most of the lower echelons (except for the gendarmery) are staffed by natives of Boujad or adjoining towns. Movement from these posts by promotion or transfer is minimal.

The local bureaucracy is formally complemented by an elected municipal council for Boujad and by rural communes for the surrounding region. Each of these has its own budget, with income from local market taxes, occasionally supplemented by central government subsidies. Due to administrative inexperience and the lack of personnel independent of the local Ministry of the Interior officials, these bodies are largely dependent upon the local qaid for their initiatives. In one recent year the only action of the municipal council of Boujad was to provide chairs for the qaid’s office, although since 1970 they have undertaken more substantial projects. Appointment to communal councils has been regarded in recent years principally as a sign of favor from the local and provincial officials of the Ministry of the Interior. This fact has not necessarily made such individuals dependent. One member of the municipal council was considered locally to be a “shadow qaid”—his intimate knowledge of the Boujad region, his general reputation for exercising influence, and his multiple contacts with government officials elsewhere gave him in effect more power than the officially designated qaid. Similar “shadows” are found throughout the local administrative apparatus.[43]

Since independence both the religious law court and the civil court have been under the separate jurisdiction of the Ministry of Justice and thus independent of the qaid and other local officials. The religious court, which in principle was autonomous throughout the protectorate, is staffed by a qadi, together with a staff of several clerks and notaries.[44] The civil court is staffed by a civil judge (hakerri) and several assistants. This judge is a Sherqawi who, because of his reputation for probity, is one of the few in Morocco allowed to preside in his native town.

The most pervasive Makhzen presence in Boujad is that of the school system. In Boujad as elsewhere, this has since independence undergone a massive expansion in both personnel and students, if not in quality. Prior to the Second World War, the French policy was to educate only those Muslims who in any case would traditionally have been educated. In the last decade of the protectorate the educational system expanded considerably but still enrolled only a fraction of the school-age population, predominantly urban and male. For Morocco as a whole in 1938, 1.7 percent of school-age children were enrolled in primary

schools and 0.1 percent in secondary schools. The respective figures for 1955 were 11.2 percent and 1.2 percent, with 90 percent of elementary-school children dropping out before attaining a certificate of primary education (Cerych 1964: 297–299). There was a similar drop-out rate for secondary education, since only 530 Muslims acquired the baccalaureat in Morocco during forty-four years of French rule (Waterbury 1970:84). In Boujad, those Muslims enrolled in school were at first exclusively the children of prominent Sherqawa, rural qaid-s, and a few prosperous merchants, although recruitment was somewhat widened by the 1950's. In contrast, nearly all of Boujad's Christian and Jewish school-age population received schooling, the latter through an Alliance Israelite school established in 1931. In addition, a limited number of students were educated in a private "free school" (medrasa hurra), set up in 1947 by local nationalists interested in providing for a truly Muslim education, primarily in Arabic. This school was assimilated into the government system shortly after independence.

Since independence the number of students has dramatically increased. Some 38 percent of the school-age population was enrolled in primary schools throughout Morocco in 1966–1967 (Tiano 1968:115). Presently more than half the children of school age receive some primary schooling, and roughly 6 percent go on to at least the first few years of secondary schooling. For Boujad, this means that almost all the sons of townsmen and a fair number of their daughters enter the primary schools. There are a few rural schools as well, but access to education in rural areas remains difficult and the quality low.

Literacy can now be assumed for younger townsmen. In 1969, 181 teachers were employed locally at the primary and secondary levels. There were approximately 5,500 elementary-school students and 1,200 in the first three years of secondary school. Students wishing to complete the remaining three years of the secondary cycle must at present go to other towns, although additional years of the six-year secondary cycle are to be made locally available shortly.

Almost all of the primary schoolteachers are Boujadi-s, including the school directors. Boujadi-s also predominate in the secondary schools, although outsiders are also employed. These included a dozen French instructors in mathematics, science, and history in 1969; nine remained in 1973. In recent years there have been modest efforts to place a few instructors from other parts of Morocco. But throughout their educational careers, most students continue to experience the same multiplex bonds linking them and their families with their instructors as pervade all other social activities.

*** Summary

This chapter has introduced some of the key institutional frameworks for social action in Boujad. By institution, I mean primarily a field identified with specific conventions or accepted ways of accomplishing certain sorts of social action. I have also tried to provide a concrete ethnographic representation of the town and its region in relation to recent historical developments. The account of economic institutions pointed directly to how persons relate to each other in the market setting. The accounts of government and religious institutions were more formal. How these and other institutions work or are thought to work will become clear only after the account of the social structure. By social structure, I mean the principles by which the units constituting a given society—persons or groups of persons—are defined and related to each other. The next chapter specifies these principles and elaborates them, first in an urban, then in a tribal, setting.

** 4. Social Structure

*** A Definition

Given its dominant association with the Sherqawi marabouts, Boujad is hardly the Moroccan equivalent of Middletown. Only two other towns in Morocco, Wezzan and Mulay Idriss, have such a singular importance as pilgrimage centers. However, the strategy of looking for a Middletown on the basis of a “lowest-common-denominator” typicality has contributed significantly to the present impasse in the characterization of social structure in North Africa, particularly in Morocco. Efforts to abstract a notion of social structure from superficial patterns and characteristics have resulted in a bewildering array of apparent local and regional structures in which tribes and localities are perceived as what Jacques Berque, in another context, has called “little monsters of social ingenuity” (petits monstres d’ingeniosite sociale) (cited in Lacouture and Lacouture 1958:80).

A review of recent attempts to characterize North African society has pointed to the fact that it is “not blocked out into large, well- organized permanent groupings—parties, classes, tribes, races—engaged in a long-term struggle for ascendance.... Structure after structure—family, village, clan, class, sect, army, party, elite, state— turns out, when more narrowly looked at, to be an ad hoc constellation of miniature systems of power, a cloud of unstable micropolitics, which compete, ally, gather strength, and, very soon overextended, fragment again” (C. Geertz 1971:20).

One reason for the difficulty in perceiving structure in North African society, and perhaps to a certain extent elsewhere in the Arab world, is that many standard definitions of social structure are narrowly conceived to account only for situations in which groups of persons are ordered in positions and statuses (e.g., Evans-Pritchard 1940:262; Turner 1969:125–126; Gellner 1969:35–69). In many parts of the Islamic Middle East and elsewhere it is increasingly apparent that social structure can also be conceived with persons as the fundamental units of social structure, rather than their attributes or statuses as members of groups. This is the case for Morocco, where, moreover, persons are not arranged in layer-cake strata in which broad groups of persons are seen as essentially equal. Instead, they are linked in dyadic bonds of subordinance and domination. Moreover, these ties are characteristically dissolved and re-formed rapidly and significantly. The relatively stable element in this type of social structure is not the patterning of relations between persons or groups of persons, as is suggested by many definitions of social structure. Rather, it is the culturally accepted means by which persons contract and maintain dyadic bonds and obligations with one another.[45]

This conception of social structure is implicit in the way Boujadi-s perceive regularities in the social order and proceed to act on these assumptions. Like other Moroccans, they discriminate with considerable subtlety between variations in wealth, power, the prestige of descent, patronage and clientship, and the effectiveness with which persons can utilize such attributes. The aggregate of influence a person possesses with respect to others is frequently expressed by the terms kelma “word” and wejh “face.” The assessment of who has these qualities is continually affected by the outcome of social action and is never taken for granted. Given the various resources available, each person is necessarily a bricoleur, or social handyman, viewing society less as definitely structured than as capable of being re-formed so as to maintain or increase his

own standing in it. The dominant image of society is a constellation of interpersonal ties, not any arrangement of groups—since groups, from the point of view of Moroccans, tend to have an ephemeral protoplasmic quality, from national political parties to the most informal local association.

Persons achieve social honor, in Weber's sense of the term, on the basis of varying, experimental combinations of their attributes— wealth, political office, residence in a quarter, maraboutic descent or descent from the Prophet, etc.—in no case can the social honor of a person be determined from an abstract knowledge of his attributes or statuses alone. Some of these statuses, such as those of kinship, might be relatively stable, even permanent in the case of blood relations, but the obligations and expectations which persons hold as a result of them are still a matter of significant variation and amenable to a wide latitude of revalorization. As already discussed, few Moroccans make any assumption about the social honor of a person solely on the basis of any formal status or office which he may possess. For instance, the attributes marabout and Sherqawi descent in themselves say little of the social status of the persons holding them. Like other bases of prestige, their significance has shifted significantly with the social and economic transformation of the last sixty years.

*** The Spatial Representation of Social Structure

The concept of social structure is inherently linked to how Boujadi-s conceive the spatial organization of their town. Like other units of society, the quarter (derb) is a cultural construct which for Boujadi-s is not defined in terms of an ad hoc listing of formal features. These serve only as indices of the underlying cultural concept.

An earlier generation of colonial ethnographers recorded the formal arrangements of quarters and, accepting the then popular theories of Levy-Bruhl on the nature of "primitive" mentalities, concluded that the evident protoplasmic disorder of quarters was a direct physical projection of the "alogical" disorder of the "indigenous" mind (e.g., Louis Brunot, cited in Hardy 1926:21). Lacking an adequate conception of social structure as based on culturally accepted means by which dyadic bonds between persons are contracted and maintained, ethnographers instead sought, and failed to find, order at the level of "on-the-ground" social relations and the use of physical space.

Boujadi-s presently divide their own town into anything from thirty to approximately forty-three quarters (see Fig. 6 and Table 4). The differences in perception are related to what informants know of the social history of the town, which varies with generation and experience, and how they have experienced it, which varies with social position. Only those clusters of households evaluated as sustaining a particular quality of life are known as quarters; thus some Boujadi-s do not consider certain sections of the town to constitute "real" quarters.

Notes: The figures for adult residents are based on the registration forms for the 1963 municipal elections. An adult is defined for electoral purposes as a person 21 years of age or older.

Because of the rounding off of decimals, percentages do not always total 100%.

Names of Sherqawi quarters are italicized. Identification numbers of quarters established prior to the protectorate are in italic type. Dates in parentheses are those of the founding of the indicated quarters.

^a No data available.

^b A direct borrowing from French bordel (“brothel”). The quarter was an official red-light district under the protectorate.

Ideally the households of a quarter are considered to be bound together by multiple personal ties and common interests. These complex ties are said to symbolize qaraba^ a key concept which literally means “closeness.” As used by urban and rural Moroccans, qaraba carries contextual meanings which range imperceptibly from asserted and recognized ties of kinship to participation in factional alliances, ties of patronage and clientship, and—the facet which will be developed here—common bonds developed out of residential propinquity. “Closeness” is acting as if ties of obligation exist with another person which are so compelling that they are generally expressed in the idiom of kinship. This is because kinship ties, especially those of blood, symbolize bonds which, however they are valorized, are considered permanent and cannot be broken. Most quarters have a cluster of households which claim relation to each other in this way.

In many respects “closeness” in present-day Morocco resembles the concept of “group feeling” (fasabiya) presented over five hundred years earlier by the North African philosopher and protosociologist Ibn Khaldun. In his exposition of the concept, Ibn Khaldun indicates the multiple bases on which “group feeling” can be asserted among both townsmen and tribesmen but ultimately opts for the ideological position that the “naturalness” of blood ties makes them superior to all other modalities as a basis for “group feeling” (Ibn Khaldun 1967:249–310, esp. 264). Present-day urban and rural Moroccans make the same claim. Such a position does not distinguish between “closeness” using kinship as an idiom in which social relations can be expressed and “closeness” as the presence of “actual” ties of kinship.

A quarter, then, can be defined as the extension of “closeness” in contiguous physical space. It can be said to have prestige in relation to the strength of the qaraba attributed to it by its component households and by other townsmen. A quarter should be able to assume a certain moral unity so that in some respects social space in it can be regarded as an extension of that of its component households. A household can belong to only one quarter, but there is flexibility over time as to which this can be, especially among households of lesser prestige.

“Closeness” in a quarter—just as between kinsmen, factional allies, and patrons and clients, in towns or elsewhere—can be symbolized by the exchange of visits on feast days and on other occasions, by assistance and participation in the activities connected with births, circumcision, weddings, funerals, graduation from school, and memorization of the Qur’an. The heads of households of a quarter (mwalin ed-derb) share certain minimal collective responsibilities; they often construct and maintain a mosque, hire a Qur’anic teacher (fqih) for it, and congregate there the night of Laylet 1-Qadr (the 27th of Ramadan) to listen to the recitation of the Qur’an until sunrise. They may also hire a night watchman (‘assas).

Because of the multiple ties which link the residents of a quarter, respectable women who never venture to the main market can circulate discreetly within it, since the residents are “known” (me^uf) to each other. For this reason, quarter residents are concerned with any scandal which may affect their own reputation and may occasionally try to force the departure of undesirable households or persons.

Even when “closeness” is maintained by overlapping ties of residential propinquity and kinship, as in certain Sherqawi quarters in Boujad, informants emphasize that the obligations between persons are not fixed. As stated previously, there is an existential realism toward “the way things are” which permeates their conception of the social order. Thus one elderly Sherqawi illustrated as follows the flexibility of alliances in blood feuds involving his quarter prior to the protectorate: “How can you say that it was always your brothers or your father’s brother’s sons who would help you in a fight? They might live far from you and, besides, they have their own household and affairs to look after. Why should they risk their lives for you as well?” The same informant made a similar point using the concept of hbab (sg., hbib) which literally means “loved ones” but which frequently is used to specify persons linked by blood relations. When necessary for context, the meaning of such terms is more strictly delimited. For example, Boujadi-s speak of some persons as being qrab (sg., qrib) or hbab be-sh shra\ to indicate those who are kinsmen within the definitions of Islamic law concerning marriage and inheritance. The rights ensuing from such ties are fixed in Islamic law, but in the context of Moroccan society these rights, like any others, are a matter of negotiation in light of the total social context.

Thus in the Moroccan context, kinship, including close blood relationships, constitutes a class of relations upon which specified social roles can be developed rather than a set of relationships with specified, fixed obligations attached to them. This is in substantial contrast with, for instance, the specific obligations attached to kinship ties in southern Iraq and some other parts of the Arab world (e.g.,

Salim 1962). In Morocco the presence of “actual” kinship relations between persons is not in itself a specific indication of the actual contours of the relationship.

For “closeness” to be said to exist in a quarter, it must be capable of mobilizing for effective social action in some contexts. An external parameter can be noted here. Most quarters are composed of two hundred to six hundred inhabitants. Those residential clusters considerably smaller or larger than this range tend to be the ones which are not regarded as quarters by all informants. Such a guide is very rough but suggests that, for bonds of “closeness” to be effective in terms of physical propinquity, there is an optimal quantitative range, above and below which such ties become untenable. Census figures (Kingdom of Morocco 1961) suggest a similar range for rural local communities (daw war-s).

In addition, each quarter has one or several “big men” (kobbar), or men with “word” (kelma) , who in some contexts act for the common interests of the quarter and can mobilize households within it. Quarters lacking persons with “word” are usually incapable of mobilization and are regarded by many as not being quarters at all.

Residential areas with a high proportion of rural immigrants are generally said to lack “closeness.” These immigrants settle wherever there is suitable accommodation available, rather than cluster by origin, and have a tendency to move frequently. Residents of such areas are said by older townsmen to be “unknown” to each other, even if they consider themselves a quarter. Generally they are unable to mobilize as an effective group, since they lack the economic resources and leadership to establish such signs of prestige as a quarter mosque. Since no one in them has “word,” such quarters tend to be the last to

acquire such urban amenities as sewers, water, and paved passages or (for the “new” quarters) roads.

Given the past competitive advantages of the Sherqawa, including education as “sons of notables” (fils de notables) in the early days of the protectorate and preferment in official positions, some have been able to maintain local and even national prominence by converting the waning power of maraboutism into assets more viable in altered social and economic positions. This is reflected by the continuing existence and prestige of several (not all) Sherqawi quarters over the last sixty years, especially the ‘Arbawi and Zawya quarters, inhabited by those claiming descent from the most prominent Sherqawi marabouts of the last two centuries. In these quarters more than others, the ties of residence, faction, and descent tend to coincide, although these identities are still amenable to considerable manipulation. Many residents hold rights in the undivided estates of their maraboutic ancestors in addition to shares of offerings made to the shrine of their founding ancestor. Residents of both quarters can point to numerous occasions in the recent past when effective alliances have been formed on a quarter-wide basis.

Sherqawi and other quarters unable to maintain such prestige are liable to dissociation—since the Second World War, prosperous Sherqawi merchants in some of the less prestigious quarters have moved to New Boujad and have downplayed their Sherqawi identity. Rural immigrants moving into such quarters then try to claim Sherqawi descent as one means of upgrading their own prestige. The “closeness” of the remaining original inhabitants can no longer be expressed in social action. Not infrequently, entire quarters disappear over relatively brief spans of time as a consequence of this process.[46]

In contrast, there are a number of quarters formed over the last few decades which now attempt to claim prestige equal or superior to that of the leading Sherqawi quarters. The Khaluqiyin quarter (6–20) has at its core the sons of a non-Sherqawi merchant who before and after the protectorate engaged in trade with Khnifra, in the Middle Atlas highlands. They became prosperous and early in the 1930’s purchased adjoining plots in the original French-designed New Boujad. Later, two of the brothers became active in nationalist politics and, publicly at least, were the leaders of rival parties. Most residents of the quarter claim links with these core households. These, in turn, have begun claiming descent from ‘Ali Smuni, a “rediscovered” brother of Sidi Mhammed Sherqi who, they assert, unlike the marabout, was a “progressive” ahead of his time. Thus they claim the prestige of distinguished ancestry without its supposed encumbrances. Quarters founded by rural qaid-s during the protectorate had a similar rapid ascendancy—and, in some cases, a precipitate fall.

*** Establishing “Closeness”: An Example

The rise and fall of quarters is related to their ability to sustain “closeness” based at least in part upon residential association. This section will outine the mechanics by which the claim to “closeness” was made in one particular quarter.

The Qsayra quarter (6–9), “The Little Fortress,” is so named because it adjoins the fortified, high-walled Sherqawi religious lodge which forms the nucleus of the Zawya quarter and, in fact, looks like a scaled-down version of that quarter.

Qsayra’s residents tend to claim “closeness” to each other by descent and marriage, although, as is also the case for Sherqawi quarters, in most cases no exact genealogical links can be demonstrated. Most residents of the quarter claim that they or their ancestors came from Ait Saleh, the tribal grouping to the immediate west of Boujad. Without denying Ait Saleh origins, others prefer to stress their relations with one Hajj Bu Bakr, himself reputedly of Ait Saleh, who founded the quarter at the turn of the century and whose household serves as the “core” with which other households claim affinity.

Bu Bakr was a tannery owner and grain merchant when the French arrived in 1913. Not long after this event, he made a fortune by selling grain in exchange for land and houses during a period of extensive drought.[47] Bu Bakr soon converted his fortune into social honor by making the pilgrimage to Mecca and thus acquiring the title Hajj, constructing an imposing house for himself, and marrying a second wife. As his sons matured and married, he built adjacent houses for them, in the manner of other men of prestige. He also constructed a small mosque for the quarter and made the major contribution toward paying the fqih hired to teach in it. He died shortly after the Second World War, although his sons and widows continue to reside in the quarter.

The means by which residents of the quarter claim “closeness” with Hajj Bu Bakr deserve some attention. There are some thirty dwellings in the quarter, although when I asked informants to enumerate them for me they invariably excluded several. These turned out to be those living units which somehow did not qualify as households—men sleeping in shops; the dwellings of several poor, childless couples; and all those excluded from the circle of “closeness” for some assumed moral defect. These “nonhouseholds” did not share the visiting patterns of the “counted” households of the quarter or engage in their multiple reciprocal exchanges.

The asserted ties of one informant will be examined in detail, since they orchestrate virtually the entire range of means by which “closeness” can be asserted. At first Ma‘ti (7–1), a shopkeeper who had attended the local college, claimed that Bu Bakr was of his “blood” (men demmi). This he elaborated by claiming that the relation was

(Ma‘ti)

Informant’s household

Asserted kinship link

[[d-f-dale-f-eickelman-moroccan-islam-20.png][Figure 7. Kinship ties of an informant in Qsayra quarter.]]

through his “father’s brother” (7–3), who had married a woman of Hajj Bu Bakr’s household.

In another context some months earlier I had asked Ma‘ti to tell me whom he considered

his kinsmen, so that I had a means of checking his statements. When I reminded him that previously he had said his father had no brothers, he replied that, since he was “close” (qrib) to Hajj Bu Bakr, then it must be through a half-brother of his father that he had never met or perhaps through a brother of his grandfather (7–5). In other words, “closeness” came first, then its ideological justification. He continued that there “probably” was a second link through the marriage of his mother’s sister (7–4), who also lived in Qsayra. Again, this tie could not be demonstrated. Finally, Ma‘ti said that Bu Bakr’s people act as if (b-hal) they are related (qrib); so they must be; and he cited at length the informal visiting patterns which prevailed between their households. No one can remember such ties clearly, he said; and since—in perfectly comprehensible Catch-22 reasoning—no one can verify them in any exact way, they must exist. He went on to link himself in a similar manner with a minor, but significant, local government official who figures prominently in the incident which is discussed below.[48]

*** The Great Shrine Incident

The perseverance of a quarter or any other group is contingent upon its effectiveness in ongoing social situations. Ties of kinship, occupation, and residence, among others, may form the base of active alliances. The emphasis placed on these ties varies with the situations in which they are used.

For many years residents of Qsayra regarded themselves as a quarter and were seen as such by other townsmen. But only after an incident in 1969, which involved effective collective action on the basis of quarter identity, was it commonly regarded as a quarter of high prestige. This event, which I have labeled the Great Shrine Incident, precipitated a shift in the boundaries of commonly accepted social categories by legitimizing the fusion of residence and kinship claimed by residents of the quarter. In the process, the Sherqawi prerogative of building shrines for their ancestors was effectively challenged.

The Great Shrine Incident began with the death in France of a man called Sherqawi, an artist who had emigrated to France some years earlier. Informants from the Qsayra quarter claimed that despite his name he was not a Sherqawi but of “their blood.” Moroccan friends of the artist in France had his body returned to Boujad, where at first it was placed in the common cemetery. When some of them later visited Boujad, they left money for a more “fitting” memorial with a minor local official who was a resident of Qsayra. He quickly consulted with other residents of the quarter—it is significant that he chose to pursue action along its lines rather than some other —and decided to erect a shrine (c/obba) for the artist. As one Qsayra resident later said: “After all, he was like [b-hal] a saint [wali], I don’t say he is, but how else do you distinguish a man except by building a shrine over his head?”

All informants agreed that it takes more than the construction of a shrine to make a marabout, but all shrines are regarded nonetheless as those of marabouts:

After you die [said another supporter of the shrine] your sons begin talking about how great you are and build a shrine over your head. Then they say that you have a high rank \daraja kbira] with God. Some people visit the shrine, kiss it, and ask for things. However, those that ask the most are the descendants of the shaykh [i.e., the person in the shrine]. They ask for animals and grain from the pilgrims. Then, as

the descendants of the shaykh increase in number, some continue to collect gifts and intercede with their ancestor; others become merchants and teachers and so on. That's all there is to it.

For residents of the Qsayra quarter, support for construction of the shrine was a means of upgrading their own social honor. A shrine would allow them to point to an "exemplary" ancestor in the manner of the Sherqawa and, moreover, distinguish them from other commoners. A successful mobilization against the Sherqawa would effectively validate their claim to "closeness."

The local official from Qsayra managed to supplement the initial contribution with funds from the municipal treasury on the grounds that the artist was an international figure and that the construction of a shrine for him would enhance Boujad as a tourist attraction. The site chosen was a promontory to the immediate north of the town, next to the main highway, where there already were five shrines for sons of Sidi Mhammed Sherqi. A construction permit was obtained from the qaid, and a delegation from Qsayra went to Rabat informally to see persons in and out of government who might conceivably affect events in Boujad. This move indicated, of course, a sensitivity to informal constellations of power as opposed to the formal distribution of authority. Municipal work crews were used, and, by the end of the summer of 1969, construction of the shrine was almost completed. In fact, pilgrims began making small offerings despite attempts to stop them by Sherqawa who collected offerings at the adjoining shrines.

By now, a few Sherqawa had become concerned. As one of the active opponents of the Qsayra quarter later said, if the shrine were allowed to be completed, then others could claim that they, too, were descendants of Sidi Mhammed Sherqi. The "real" Sherqawa would lose "word" by an inability to act effectively. At least some Sherqawa also stood to lose income from traffic with pilgrims.

The first men with "word" to act were two Sherqawi notaries from the prominent 'Arbawi quarter. Both were engaged in overseeing the collection and distribution of offerings at the main shrine and regularly emerged as spokesmen for Sherqawi interests. They tried to halt construction of the new shrine first by asking the local qaid, not a native of the region, to intervene. He refused (the local official from Qsayra was one of his close collaborators) on the grounds that the matter was internal to the Sherqawa and that the Makhzen was not about to intervene in their "family" affairs. The regional overseer of the Ministry of Pious Endowments, an early supporter of the Istiqlal (Independence) party and a reformist (Salafi) Muslim, also declined to intervene, arguing quite correctly that, since the Sherqawi shrines were not among his holdings, the matter was extraneous to his office.

The next move of the notaries was to prepare a petition in the name of "all" Sherqawa, only to find that, because of several recent and some not so recent disputes among Sherqawa, there was considerable resistance to its signing. Clearly, social action did not coalesce along simple, arbitrary lines of kinship or residence but depended upon each person's weighing the various alternatives for action open to him.

Eventually some sixty signatures were collected for the petition. Significantly, the most influential of the signers were prosperous Sherqawi merchants who had resided for years in Casablanca and thus were removed from local factional alliances. Armed with their

petition, the two notaries went first to a minister in Rabat. According to one of those present at the interview, his reply was markedly unsympathetic. “Once dead all Muslims are equal,” he replied, and would have nothing to do with the prerogatives claimed by a mara- boutic descent group. The notaries tried to argue that the shrines were “historical,” not “religious,” monuments, but this also fell on deaf ears.

Their next visit, to an influential private individual, was more successful. A single telephone call was placed to the qaid of Boujad, who immediately rode out to the shrine and forbade further work on it.

Informants from both sides of the dispute stressed that their formal arguments were much less decisive than the fact that someone with influence had acted.

Supporters of the shrine from the Qsayra quarter congratulated themselves that it took months for a mere stalemate to be effected against them—the nearly completed shrine was left standing—and regarded their setback as temporary: “We will stay quiet for a few years and then start building again. By that time even the Sherqawa will forget whether or not Sherqawi is a descendant of Sidi Mham- med Sherqi and will only remember his name.”

It would be misleading to interpret this incident primarily in terms of the successful attempt of nonmarabouts to acquire for themselves the symbols of maraboutic prestige. This would be perhaps too “traditional” a view of “traditional” Morocco in the light of the frequency of such occurrences in the past (e.g., Bel 1938:376–382). More to the point is the fact that a successful alliance was formed along the lines of residential propinquity, was sustained, and thus legitimized the assertion of quarter “closeness” as a social reality.

*** Social Structure: The Tribal Setting

The same underlying pattern of social structure which I have depicted in an urban setting applies equally to rural Morocco. To show this, I will describe in detail the social organization of the Sma‘la and Bni Zemmur “tribes”[49] of the upper Tadla Plain, both in the present and in the historically known past. These two tribes are no more representative of rural Morocco in general than is Boujad of Moroccan towns, at least in terms of formal characteristics. But, as I indicated earlier, it is pointless to make comparisons or determinations of typicality based on such characteristics. Since the question of personal and group identity is closely related to the conception of marabouts, it is worth discussing it in some detail. In describing tribal social structure, I want to distinguish two separate perspectives, a sociological one and that of native ideology. The latter can further be divided between “official” representations offered by rural strong-men, especially those who dealt most regularly with the precolonial Makh- zen and the protectorate government, and those of ordinary tribesmen.

The Smada and Bni Zemmur employ the idiom of agnation to describe relations between persons and groups of persons. This, of course, is one of the two features that are necessary for a society to be described in terms of segmentary lineage organization. The other feature is not present: segmentation is not the only idiom in which political relations are conceptualized; groups of persons do not primarily align themselves along the lines provided by asserted agnatic ties. Tribesmen are explicitly aware of this and, at least on

the Tadla Plain, do not assert that the precolonial past was different from the present in this respect.[50]

Members of both tribes that I am here concerned with use the metaphors of a tree and the human body to describe their internal divisions. For example, one tribesman spoke of the Bni Battu as the trunk of a tree, which in turn was divided into branches. The word used to indicate branches of a tree (‘ersh’) is not used, but rather several interchangeable terms—tribesmen are not immune to mixing metaphors. Among these terms are “group” (jarqa’), “thigh” (jakhda’), and “piece” (tarf). For convenience, I translate all these as “section.” Sections are further divided into ddwwar-s, a term which I translate as “local communities.” These, in turn, are composed of household units which, depending upon their economic and ecological circumstances, are called either “houses” (dar-s) or “tents” (khay- ma-s’). The relationships within and between these various groups are spoken of as qaraba and are symbolized in terms of blood. Thus the Sma‘la maintain that all members of their tribe are linked by blood, but explicitly deny that this tie obliges them to act in specified ways with regard to each other. Such a denial firmly excludes these tribes from the Procrustean bed of segmentation. As one tribesman said: “We are like the branches of a tree, but each section is on its own [koll farqa b-uhedha].” In other words, social and political action flows along numerous lines: residential propinquity, herding arrangements, kinship, patron-client relations, and other bonds of necessity or mutual interest. None of these ties, of course, is specific to the tribal milieu. The ecological, economic, and political conditions of rural society vary widely, although the latitude within which tribesmen can valorize actual or potential ties tends to be more limited than that available in an urban milieu.

How far the component of assumed blood relations is allowed to determine political action is a complex matter. It is not simply a question of relative autonomy from government or outside “interference,” as has sometimes been maintained. To the contrary, as will be elaborated below, the coming of the protectorate to the upper Tadla

Plain, and presumably elsewhere, appears to have strengthened the notion of the formal agnatic ideology of groups as a blueprint for political action. Second, the use of the ideology of agnatic relationships varies markedly with the role informants play in tribal society. This is an aspect rarely elaborated in anthropological accounts of such ideologies. Members of the rural elite are those who, by reason of their wealth or prestige, command a following and often act as spokesmen with the administration and other nontribesmen. It is these persons who are most capable of manipulating and describing the conceptual grid provided by agnatic relationships. The mark of a tribal strong-man is his ability to manipulate this grid and all other available ties to accumulate personal wealth and power. The only clear difference between the preprotectorate and the protectorate in this respect seems to be that, prior to the protectorate, a plurality of persons commonly acted as such an elite within each tribal group, while the protectorate enhanced the fortunes of a few by giving them the protection of official sinecures. When asking about tribal social organization, I was usually referred to such strong-men or to older men who “knew” such things. In many cases these informants turned out to be the nucleus of de facto clients and allies and expected such referrals to be made to them.

The agnatic conceptual grid elaborated by the tribal elite centers less upon the relations of local communities with each other or their role in higher organizational units than upon the relations among tribes and tribal sections. This grid, or variants of it, forms a potential base upon which relations among various groups can be legitimated and as such

constitutes an “official” native representation of the social structure (Bourdieu 1972:113). An example of such a conceptualization is presented in Figure 8. It is a version current among several elderly Sma‘la who were government shaykh-s during the protectorate (and who, by reason of wealth and clientele, continue to be “shadows” to younger tribesmen who now officially exercise the same functions). In it, the Sma‘la are descended from the Bni Jabir, an eponymous Arab tribe from which many tribal groups in western Morocco claim descent. Most of the other tribal groups of the upper Tadla Plain are made to have a similar origin: Werdigha, Bni Meskin, Bni Musa, Bni ‘Amir, and Bni Mellal.[51] However, my informants knew only their own tribe and the neighboring Werdigha with any exactitude. Contact with the other tribal groups of the upper Tadla Plain is presently almost nonexistent. In fact, the existence of some of them as groups which ever formed the basis for united action is questionable, outside of the assumptions made by early protectorate administrators. Nonetheless, it was this set of concepts which was given administrative reality by the French: qaid-s were set up over each of these groups early in the protectorate. These administrative categories were not entirely artificial, since the French determined tribal groups and boundaries early in the protectorate by meeting with those who convincingly portrayed themselves as “notables” for the groups involved and appeared capable of imposing their “word” on other tribesmen. Since many of the same notables became incorporated into the protectorate administration, it is reasonable to assume that they had an interest in sustaining this particular macro-genealogical framework.[52]

Figure 8.

Tribes of the Tadla Plain: a version of the tribal elite.

*** A Commoner Perspective: The Local Community

In contrast to the elaborate genealogical representations of the tribal elite, the perception of social organization of ordinary tribesmen is less comprehensive and differs considerably in emphasis. Most tribesmen can offer only a truncated outline of intra- and intertribal relationships. Thus, since Sma‘la is the plural of Ismahl, ordinary Smada tribesmen assured me that they claimed descent from an individual of that name. Similarly, all tribesmen could name the tribal sections of their own tribe, as well as the local communities of their own section and local communities from adjacent sections that were contiguous to their own or with which they had herding agreements. The enumerations of such units by different tribesmen never completely tally: the variant conceptual maps possessed by tribesmen of the rural social order are somewhat analogous to the townsmen’s delineation of urban quarters. The major difference is that, unlike town dwellers, all rural tribesmen belong to a local community, although their membership in specified local communities may shift in time. The analogy was probably more direct in the preprotectorate era when, for reasons of security, membership in an urban quarter was essential.

Most ordinary tribesmen describe their social organization first in terms of their local community, the group which most impinges upon their daily activities. This group relates in various ways to “higher” levels of organization.

Literally, the term dawwar means “circle.” In the insecurity of preprotectorate days, herding units of a local community pitched their tents in a circle during

transhumance, kept their herds in the middle for safety, mutually agreed upon their movements, and, to a certain extent, negotiated collectively the tenor of their relations with other groups. Such spatial representations of social order are now less clear. For one thing, local communities are not distinguished by clustered settlements. As I have already mentioned, sedentarization occurred quite late on the upper Tadla Plain, so that households settled on their lands rather than in villages. Nor is the ownership of or right to land in this region a direct clue. Local communities own no land collectively. The rights to certain pasture lands are vested administratively in tribal sections, continuing (although in a much less flexible manner) a convention which existed prior to the arrival of the French. In contrast to some other regions of Morocco, virtually all agricultural land on the upper Tadla Plain is held by individuals and in principle is transferred according to what is locally understood and enforced of Islamic law. The value placed upon agriculture was much less intense prior to the protectorate but operated by the same principles. Although most landowners now possess formal, written deeds (resm-s), preprotectorate usage was generally based upon tacit verbal understandings and conventions. Tribesmen often purchased land rights in other local communities or acquired them by inheritance and marriage. Similar principles of land use existed elsewhere, for instance in the Berber-speaking region of Bzu. Only a few exprotectorate qaid-s have taken advantage of the Torrens system of land registration, introduced under the protectorate, to obtain a title (titre) which fully removes their land from the jurisdiction of the Islamic law courts.

Members of local communities conceive of relations to each other in much the same way as do residents of urban quarters. They claim agnatic ties but are unable to demonstrate specifically that such ties encompass all members of their group. When asked to trace such relations in detail, tribal informants invariably responded that only someone older could do so. In turn, elderly informants vaguely referred to “earlier times” (bekri) as the period when the local community was entirely composed of traceable agnatic relations. Parenthetically, bekri is a temporal category used for all social action thought to have some effect upon the present social order but for which no specific context or verification can be provided. In actuality, local communities commonly consist of several agnatic cores, none of which necessarily predominates, which are interlinked by complex affinal and contractual ties.

For purposes of kinship and inheritance, a narrower, more precise range of relationships is specified. Most tribesmen are aware that by Islamic law, relationships (q ar aba) are constituted exclusively by designated agnatic ties and by marriage. Nonetheless, even these evidence considerable latitude. As one tribesman said, the qadi is in town, not in the country. By implication, even for purposes of inheritance, the legal definition of qaraba is not necessarily the decisive one in social reality.

In rural local communities, as in urban quarters, the significant criteria of group membership are a general support of its members in mutual interests and the capacity to act together with other members on certain ritual and political occasions. Contrary to Durkheim, it is not just performance of a ritual (or other collective action) which creates a feeling of solidarity. There is also a pre-existing community of interests which makes such action possible. There is a dialectical, mutually reinforcing relationship between ritual and social action. In the case of Morocco, the ensuing solidarity is symbolized by the notion of qaraba as sustained among its members.

Each local community has a council (jma’d), not to be confused with the

governmental councils present at the level of tribal sections (which in governmental neologism are considered to be rural coni- munes). Participants in the council of a local community are not formally designated. Any adult male head of a household who has an interest in the issues at hand participates, although the opinions of those who are economically or politically weak tend to be discounted or ignored in favor of those with more substantial material interests and skills. Such councils discuss the direction of movements during the winter months of transhumancy and agree when necessary on a spokesman (mqaddem) to represent them collectively. Frequently the same men are repeatedly selected as spokesmen, but they cannot as a consequence be said to hold formal "office." The decisive factor is what local community members consider the most efficacious representation of their interests, as well as internal constellations of wealth and power. Dissidents always have the option of breaking away and forming new local communities or, in some cases, of shifting their allegiance to other groups with which they have pre-existing ties.

There are a number of parallels between the performance of collective actions associated with urban quarters and those associated with rural local communities. Each local community constructs a mosque, although this may be no more than a tentor hut (jiwala') almost indistinguishable from other dwellings. The council of each local community usually contracts on an annual basis for a Qur'anic teacher to instruct its children in the rudiments of reading, writing,

and the Qur'an. The mosque often serves as the sleeping quarters for this teacher (fqih). One inhabitant of each local community, usually self-selected, serves as prayer-caller.[53]

Each local community also has associated with it the tomb of a marabout, although this is usually only a sporadically maintained, derelict, rectangular structure in the midst of their communal burial ground. Only rarely are new ones constructed. These marabouts generally are called fqih-s by tribesmen and are often compared to the impoverished, transient Qur'anic teachers, also called fqih-s, with whom tribesmen are familiar. Sacrifices are never offered at these tombs, although women occasionally offer candle stubs or coins, which children promptly pick up. In contrast with the leading Sherqawi marabouts, little is known of these fqih-s beyond their names, nor do they have claimed descendants. Occasionally such marabouts are drawn out of anonymity by having compelling or unusual dreams and other uncanny events attributed to their inspiration. In another case, a maraboutic shrine gained prestige when the brother of an ex-qaid restored a tomb near his lands and encouraged offerings to be made to it. He then persuaded some Smada to visit it each fall on their way to the musem of Sidi Mhammed Sherqi in Boujad. As a consequence, two local communities began leaving token offerings of grain at harvest time, assuming that the tomb housed a "forgotten" Sherqawi. "Closeness" to the Sherqawi was attributed by the tribesmen to the quid's brother because of the care he bestowed on the tomb.

Although each local community usually is associated with a maraboutic tomb, there is no one-to-one correlation. There are many more tombs than local communities. This allows for shifts in boundaries and identities. On the plains to the north of Boujad there are eighty-nine such tombs, an average of one for every six square kilometers and 150 persons. These maraboutic tombs constitute a framework in which aspects of the social order can be concretely symbolized as groups shift in their composition. Most local communities also maintain covenants with a major marabout, such as Sidi Mhammed Sherqi and jointly make offerings to certain of his descendants, called "visitors" (zewwar-s), who are

thought to constitute particularly efficacious links between the group and the marabout. These will be discussed in detail in Chapter 6.

Each household or tent in the countryside belongs to only one local community, just as an urban household belongs to only one quarter at any time. The refusal or inability of a household to contribute to any of its collective obligations does not in itself serve as a sign of dissociation from the local community, although it generally affects its capacity to have a say in the collectivity's affairs. When breaks occur, a household unit or group of them may decide to form a separate local community. This will be identified by a separate marabout's tomb, burial ground, mosque, and other indications of collective identity. A particularly useful means of tracing the realignments both of local communities and of tribal sections is their conduct at the annual festival of Sidi Mhammed Sherqi in Boujad. Conduct at this festival constitutes a form of publication of new social alignments. These are perceived by the arrangement of tents and the part taken by local communities and tribal sections in "powder plays" (tehrak-s) , competitive displays of horsemanship in which riders try to gallop in a line abreast and fire their muskets in unison on a given signal. Such "powder plays" are always accompanied by heavy, serious betting between the groups involved. Differences that develop during these contests often themselves engender new lines of social demarcation.

Tribal Sections and Alliances

The identity of tribal sections is more stable over time than that of local communities. In part this is because both the protectorate and the independent Moroccan administration invested what are administratively considered to be tribal sections (often "tribes" to tribesmen themselves) with collective rights and obligations. These included rights to collective pasture lands, permits for transhumant movements, taxes, and other administratively imposed obligations. To a certain extent the protectorate "froze" the lines of political maneuver by recognizing these units, although there still was considerable flexibility as to how rights and obligations were construed, allocated, and defended. Prior to the protectorate, sections also fulfilled defensive functions. The upper Tadla Plain is dotted with the ruins of fortified compounds (dshar-s), generally located on promontories, which served as places of refuge from which sections could defend themselves and their flocks. No similar enclosures existed at the level of local communities or, in general, at the level of tribes.

Arrangements for the use of grazing land are currently the best indication of the flexibility with which idioms of group relationships are interpreted. An informant from Bni Battu, one of the most "traditional" tribes in its genre de vie, stressed that the most important factor in such arrangements was that both parties be mutually "known" (me'ruf) to each other and confident of each other's trustworthiness. This was considered more important than abstract considerations of tribal and sectional allegiance. Asserted ties of agnatic descent or affinity, common bonds with Sherqawi marabouts, contractual ritual alliances (tata) (see below), and simple de facto agreements of cooperation are all regarded as sufficient for such confidence to exist.

Grazing agreements were not limited to negotiations between groups. They also occurred between individual herd owners who were not necessarily from the same tribal section or tribe. I use the past tense because of the marked decline in the size of herds and transhumancy since the end of the Second World War. Presently, transhumancy is confined to administratively approved seasonal movements among neighboring groups and shows

little yearly variation. Such agreements were often not ordered within the formal structure of intergroup agnatic relationships, although for administrative reasons the French in the early years of the protectorate encouraged such a conception. Some French administrators in the 1920's and 1930's argued, without providing specific examples, that collective, tribe-wide pastoral agreements were "traditional," while other types of arrangements were recent, spurious accretions. A controleur civil stationed in Boujad during this period, basing himself upon specific ethnographic data, argued in opposition that arrangements made by individuals and local communities appeared equally "traditional" (B.1331,4 July 1935).[54]

In many ways, the lines of authority of the French tribal administration were a more perfect representation of the principle of segmentation and the encapsulation of smaller political units in larger ones than the conceptions employed by the tribesmen themselves. The assumption that agreements were concluded only between large collectivities appealed to popular French understandings of how tribal men ought to act (and undoubtedly did in some parts of Morocco) and, more concretely, had the advantage of being administratively tidy: transhumance was bureaucratically defined as the passage of herds between administrative districts. When such movements led to intertribal clashes, settlement was complicated by the fact that local French administrative posts had to communicate indirectly with each other through hierarchical channels. Such communication was particularly onerous in the Boujad region. Boujad and the tribes attached to it were in the zone of civil administration after 1931. The mountainous zone to the east, traditionally used for transhumance, was a "Berber" region and under military control. In fact, to solve the administrative problem and at the same time maintain a clear separation between "Berber" and "Arab" tribesmen, a military administrator in 1935 seriously proposed the ban of all pastoral trans- humancy in the region. The Boujad controleur pointed out in reply that such a decision would bring economic disaster to the tribes of the Boujad region that were dependent upon access to the complementary ecological zone of the mountains.

The modalities of grazing agreements depended upon a range of political and economic factors. For instance, the Smada tended to deal with the Berber-speaking Zayyan in tribal sections. This was partly because long-range transhumance required a large number of personnel to be effective. Zayyan territory was also potentially hostile. In contrast, most Smada dealt with the Bni Khiran and Wer- digha tribesmen to their west as individual heads of residential units (khayma-s). These tribes occupied complementary ecological zones. One herder might possess rights to land more suitable for grazing in humid years; another, land more suitable for dry years. Depending on the total complex of relations existing between the two parties, such arrangements varied from direct reciprocal exchanges or generalized mutual aid, accompanied by no more than symbolic gifts, to the payment of cash or a specified number of animals of the herd in exchange for grazing rights (B. 1331, 4 July 1935; Bonjean 1928: 74–78).

The formality attached to such agreements varied widely. Two tribesmen, even of different tribes, who had such arrangements of mutual trust were descriptively called "companions" (saheb-s). The same term often applies to local communities with mutually supportive relationships. In a terminological variation, the Bni Tsa section of Bni Battu (Bni Zemmur) call their relation with the Wlad Khellu, also of Bni Battu (see Fig. 9), one of "brotherhood" (khaw- wa). These two sections share the same pasture land, together with the other sections of the Bni Battu, and are distinguished by having pragmatically supported each other's interests in grazing and administrative disputes over several decades. This relationship, however, entails no ritual or formal contractual alliance. Members of both tribal sections explained that a khawwa relationship simply

implied that they tended to act in each other’s interests over a prolonged period. None of the other sections of the tribe had any similar record of sustained mutual support.

Tribe

Section

Local Community

[[d-f-dale-f-eickelman-moroccan-islam-19.png][Figure 9. Bni Battu. (Based on information from Wlad l-Hya tribesmen^ 1970.)]]

Prior to the protectorate, local communities and sections could formally symbolize mutual support through a “contractual ritual alliance” (tata). This type of alliance existed in various forms in many other parts of Morocco (Bruno and Bousquet 1946; Vinogradov 1973; Hart 1973). On the upper Tadla Plain, such alliances were generally made between local communities or sections of different tribes, although I have recorded several instances of intratribal alliances. The contracting parties agreed to refrain from fighting and raiding each other and, in general, to aid each other against external threats. Informants explained that such alliances were like the existence of milk brotherhood except that intermarriage was permitted.[55] Such alliances were temporally too remote from my informants for them to describe in detail how they actually operated. In principle, one was supposed to treat a tata ally as a brother. I have already indicated some of the contingencies which effectively allow such obligations to be variously interpreted.

Tata was contracted in formal rituals. For instance, the Flalha local community of Bni Tsa section (see Fig. 9), concluded an alliance with the ‘Ababsa section of the same tribe.[56] The councils (/ma‘a-s) of the two groups met in Boujad at the shrine of the Sherqawi marabout Ma‘ti ben Saleh (2–6), clasped hands over his cenotaph, and swore their alliance.

The Wlad Khellu section of Bni Battu concluded a tata alliance in a different way. They have—or, strictly speaking, had—alliances with three tribal sections. Two of these had territory contiguous to theirs: the Arab-speaking Wlad ‘Ayyad (Bni Zrantel) and the Berberspeaking Ait Bu Haddu. The tie to a group spatially distant from them was with the Jriyyat section of Shegran. In one instance, tata was concluded by a communal meal between the councils of both sections. Afterward, each man present removed one of his slippers (belgha-s) and placed it in a pile along with those of other men of his section. These were then matched at random. All members of the two groups were henceforth in a tata relation, and those whose slippers were

paired generally approached the other group through their counterpart. In another case, lactating women of the two sections nursed each other's children after the communal meal of the two councils. In the final case, a cous-cous eaten by the councils had in it milk from the women of both groups.[57]

Once tata was contracted, any violation of it, such as theft, was thought to incur supernatural retribution. Since French pacification, no new alliances have been contracted. As one tribesman said: "Now we are all in tata with the Makhzen." Existing relationships, however, continue to be recognized, and the term is now used metaphorically. For instance, tribesmen ask for the price of tata (i.e., a low price) from Boujadi merchants who are by origin from a group in tata with their own.

Knowledge of such alliances tends to be highly concentric. Each tribesman tends to have knowledge only of the tata relations of his own section. Those of other groups are not systematically known. Such alliances involve only the two contracting parties, so that a group called upon to come to the aid of a tata ally could not call for the support of groups which in turn were allied to it.

The Evidence of the Past

It can be argued that the political and economic transformations of the last sixty years have been so substantial that tribal organization described primarily from contemporary ethnographic evidence or the contemporary remembrance of things past differs fundamentally from that of the preprotectorate era. Of course, some very basic shifts have occurred. Since the protectorate, government intervention has greatly restricted the possibilities of intergroup hostilities. Matters previously settled among the tribes themselves or through maraboutic mediation now almost inevitably involve government intervention. Under current conditions, tribesmen can be more flexible in contracting and honoring alliances. Nevertheless, as I have tried to indicate, the available evidence suggests a continuity in the fundamental assumptions about the social order, rather than a sudden and marked discontinuity.

There exists fragmentary but nevertheless significant evidence in addition to that which I have already cited for the tribal social organization of the upper Tadla immediately prior to the protectorate. This is the Journal Politique of the military intelligence unit of the

French Corps de Debarquement for western Morocco, covering the period 1908–1912 (JP). These reports tend to confirm the description of tribal organization which I am presenting here. Only after the administrative machinery of the protectorate was set in place were tribes and their subdivisions assumed to be sharply delineated groups—whose form and capacity for alliance with other groups corresponded exactly, and curiously, with the assumptions implicit in the rural administrative apparatus.

Particularly relevant is the manner in which resistance was organized against the French on the upper Tadla Plain. It indicates a flexible, even entrepreneurial perception of the mechanics of alliance formation. For example, in the summer of 1910, one Shaykh Mha PAttawi recruited tribesmen of the upper Tadla to form a raiding party against tribes in the

Shawya that failed to resist the French.[58] He was initially joined by two to three thousand men on foot and five hundred horsemen from Bni ʻAmir, Ait Rbaʻ, and several sections of the Bni Meskin. His method of recruitment on the upper Tadla Plain was to proceed with his followers from one local community to another. In the best tradition of pyramid sales tempered with extortion, he demanded a “contribution” for his holy war (jihad) and threatened confiscation of the herds and grain supplies of recalcitrant groups. “Contributors” then were allowed to join the raiding party and take a share of future exactions (JP, August 1910). There is no evidence that any formal apparatus based upon agnatic intergroup relations had any effect upon Shaykh Mha[r]s operations.

French reports suggest a similar situation with Weld Karda, vaguely described as a “war chief” of the Smaʻla, who later became one of the first protectorate qaid-s. His recruiting strategy resembled that of Shaykh Mha except that it was on a smaller scale. Most of his following was from the Smaʻla, and raids were limited to the contiguous Werdigha tribe, who at that time were reported to be “conciliatory” toward the French (JP, September-December 1910).

An incident particularly indicative of the latitude of options available to tribesmen in forming alliances occurred during the struggle for the sultanate between the brothers Mulay ʻAbd l-ʻAziz and Mulay Hafed which began in 1907. Bitter fighting broke out between supporters for the two contenders among the Bni Zemmur and Smaʻla, resulting in a large number of deaths. To the discomfiture of the French, support for the two contenders was determined not only by what the French considered “political” factors, which for them meant the contest for the sultanate, but also by what they considered “ordinary” (i.e., apolitical) local disputes. Thus, an October 1909 entry in the Journal Politique states: “The Ait Saleh section [fraction] of Bni Zemmur ... is fighting with the Wlad Gwawsh section of the same tribe [over water rights—a dispute which persisted into the 1930’s]. The former, being more directly under the influence of [the Sherqawi marabout who supported ʻAbd l-ʻAziz], professes sympathies for Mulay ʻAbd l-ʻAziz. Nothing more is necessary for the opposing section to place its cause in care of Mulay Hafed and to contract an alliance with the Hafedist Smaʻla tribe.” Three months later the author of the report corrected his assessment of the composition of the two factions and reported that the marabout of the Sherqawi lodge[59] had concluded a truce between the Smaʻla and the Bni Zemmur, “or rather between the Hafedist and Azizist leaders of these two tribes” (JP, January 1910). Tribal alliances clearly suggest a much more complex pattern than that allowed by the formal ideology of agnation.

I have tried to make two major points in this chapter. The first is to show that social structure in Morocco, both urban and tribal/ rural, is based upon the ordered relationships not of groups of persons, but of persons. Moroccans do not conceive of the social order as consisting of groups in structured relationships. Emphasis is placed on managing personal networks of dyadic relationships. This is enough of a departure from accepted sociological understandings of North African society, particularly that element designated as “tribal,” that I have presented my ethnographic account in detail. Tribes, tribal sections, local communities, quarters, agnatic descent, and so on merely constitute frameworks by means of which persons relate to each other. The constant element in this type of social structure is the means by which persons contract and maintain ties with each other. This is implicit in the concept of “closeness” (qarabafr by means of which Moroccans describe such relationships.

Second, in specifying that this underlying notion of social structure is relatively constant over time—at least over the period of roughly a century that is my chief concern—I am not

proposing an unchanging metaphysical formula. Nonetheless, because of the inherent flexibility of this type of social structure, it is capable of accounting for a wide range of patterns of social action in Morocco, including the transformations engendered by the protectorate. This becomes more apparent when attention is shifted from the sociological description of social structure, the concern of this chapter, to the matrix of social definitions of reality through which everyday life and actions become subjectively meaningful to Moroccans themselves.

** 5. Impermanence and Inequality: The Common-Sense Understanding of the Social Order

*** The Common-Sense Foundations of Social Experience

Social institutions are subjectively held ideas about social relations shared by members of a given society. The existing social order is a manifestation of this texture of meaning. Whatever specialized knowledge members of a society possess or whatever activities they perform, they share a “natural” attitude toward the social world (Schutz 1967). This attitude is made up of everyday, unsystematized, common-sense symbolic understandings of how the world “really” is. Under ordinary conditions, these basic assumptions about the social order are so taken for granted that they are not articulated by members of a society. But they form the implicit background against which social action is planned and carried out. Special frames of reference, such as formal religious ideologies, are elaborated against the background of such understandings.

World views, or “natural” attitudes toward the world, are made up of a number of key concepts that have a “logico-meaningful” (Sorokin 1937:18–28) fit to one another. Like the parts of the jigsaw puzzle, the concepts that compose a world view have no uniformity in direct relation to one another. Karl Mannheim compared the presentation of a world view to that of biography, in which the “inner world” of the subject must be reconstituted from fragments of meaning contained in outward actions or statements. Each of these fragments actualizes an underlying pattern of meaning and serves as a “document” of it (1952:73). The ultimate test of an adequate description of a world view, therefore, is not quantitative or statistical but consists of the description’s ability to render behavior intelligible in a given society.

In this chapter I present five of the key concepts through which Moroccans comprehend social experience. I deliberately say “Moroccans” rather than “Boujadi-s.” This study is primarily based on fieldwork in Boujad and its region, but subsequent work elsewhere in Morocco suggests that the same underlying assumptions inform comprehension of the social order throughout the country. Significantly, Boujadi-s (and other Moroccans) also make this presumption, although they are sensitive to regional nuances. I do not intend to argue that the assumptions of the nature of the social order described here stop abruptly at Morocco’s national frontiers. As I indicate below, many of these assumptions are expressed in terms of Islamic ideas that are hardly unique to Morocco or to North Africa. Had I worked near Morocco’s frontiers, the issue of cultural boundaries would probably have been more immediate, but for most Moroccans the significant others with whom they come in contact are thought to share the same assumptions.

These five key concepts are God's will (l-mektub'^ l-mqayyed, qod- ret Allah) * reason ('qal), propriety (theshshem^ hshumiya), obligation (Jiaqq) , and compulsion ("ar). To describe them briefly, the concept of God's will focuses man's attention on the empirical social order by attenuating speculation on other possible orders. Reason enables men to perceive this order and discern what is in their best interest. Propriety is possession of the self-control which enables men to act properly in the social order, while the nature of obligations contracted by men determines and maintains their social honor in relation to other men. Finally, compulsion is a means of restoring serious breaks in the web of obligations which bind men together. The emphasis given to these five concepts is admittedly arbitrary, but this is inherently the case in any attempt to describe a world view. Any such description is largely shaped by the range of social action that it attempts to render meaningful. For the problems of social identity and religious belief that form the core of this book, the five concepts that I present here are particularly significant. In passing, however, I mention a number of other related concepts. Were my primary concern with other ranges of social action, such as sexuality and sexual comportment (which figure in this chapter only as subsidiary issues), then my emphasis in describing aspects of the world view would shift as well.

The five concepts are not in a rigid, fixed relation with one another. They are maintained only insofar as they are actualized by individuals and seem to explain meaningfully and render coherent action in the social world. When they cease to do so, they tend to shift in emphasis, since men strive to perceive their social world coherently. Their interconnection can be compared to Edmund Leach's now- renowned elastic rubber sheet (1966:7). As they are used in different settings and by different persons, these key concepts are elaborated in different ways. Since they are interconnected, a change in the meaning of one leads to shifts in the meanings of the others. This flexibility accounts for their ability to accommodate and account for the major shifts in the loci of economic and political power over the last seventy years.

Certain of the Moroccan concepts that I will describe also have rich historical layers of meaning and are used elsewhere in the Muslim world. This is especially true of God's will and reason. Both of these terms occur in the Qur'an and have been the subject of an interesting study of the world view of seventh-century Arabs (Izutsu 1964). They also appear in James Siegel's account of changing perceptions of the world in northern Sumatra (1969: esp. 98–133). I am interested in seeing the elaboration and integration of these concepts principally in their Moroccan context, but I point out their uses elsewhere to show the range of variations attached to them. Popular uses of these terms in Morocco vary from those implicit in formal Islamic texts, including the Qur'an. Such divergences are not the concern of this study, for the simple reason that in ordinary situations most informants never considered the possibility that these terms could be understood in any way but theirs. The fact that these concepts are tacitly construed by Moroccans as Islamic, if not human, universals, makes their resulting vision of the world all the more reasonable and compelling.

*** God's Will and the Social Order

The inequality of men in this world (ed-denya) is too matter-of-fact to be a matter of speculation to most Moroccans. These inequalities are attributed to God's will, a concept which explains the present state of affairs as well as the outcome of any future sequence of events. God's will (qodret Allah) is a term from classical Arabic, although it is used by almost all informants, including tribesmen, as synonymous with "that

which is recorded or written” (l-mqayyed or l-mektub). Perhaps the most common expression of this concept occurs in the phrase “if God wills” (in sha Allah) , which invariably prefaces any expression of future action or events. These concepts have often been glossed in colonial ethnography as Islamic “fatalism,” a term so ambiguous as to have minimal explanatory utility. Much of French colonial ethnography eagerly represented Moroccan society as frozen in time and incapable of meaningful internal change (e.g., Levi-Provencal 1922:11). The equation of “God’s will” with “fatalism” fit the colonizer’s vision of the native better than it did the Moroccan’s assumptions about “the way things are.”

For Boujadi-s and other Moroccans, the notion of God’s will implies quite the contrary of popular French colonial ethnography: men are free to take the world as it is and to determine action on the basis of their empirical observations. The actual state of affairs is an expression of God’s will. Being inevitable it cannot be questioned.

God’s will legitimates the present—and ephemeral—distribution of social honor as the God-given state of affairs. The ranking of individuals in relation to one another is never taken for granted but is constantly empirically tested. Provisionality is the very essence of the cosmos. Consequently, attention is focused upon assessing exact differentials of wealth, success, power, and social honor among particular men as a prelude to effective, specific social action, not upon speculation over the general order of the world. God reveals his will through what happens in the world, and men of reason constantly modify their own courses of action to accommodate this will.

Far from providing cosmological ballast to an ossified status quo and discouraging the planning of future action, the concept of God’s will attenuates speculation on why particular projects succeed or fail and blocks metaphysical reflection on the fate of man in this world. The wide-awake man is thus much more concerned with adjusting to circumstances as they come along than with considering how things might have been or should be. An elderly, salaried Qur’an- reader, who formerly collected offerings at the shrine of Sidi Mham- med Sherqi, explained the concept in the following manner:

God created the world. He decides and knows everything. You have a car and I don’t. That’s God’s will [qodret Allah] . One day it might be taken away from you. That’s also God’s will. If you are a shopkeeper, how you treat people doesn’t always affect your business. There are bad- tempered traders like M who are still rich and suc

cessful. God decides whose affairs prosper.[60]

A Boujadi shoemaker articulated the same concept in explaining what he would do if someone told him his sons had been seen drinking:

If [my sons] had heads they would realize what other people were saying and leave off their conduct. As a father I would tell them to stop. If they didn’t, then they would show no respect for their father. That is written [mqay- yed]. If they continued, that also would be written. Similarly, I tell my sons to study and beat them. The younger boy is always playing in the streets, but he is better at school. Should I ask him why he is playing [i.e., get him to stop] ? He knows his lessons. The older boy always reads his lessons aloud

in front of me but he is worse in school. How can I judge who is the better of the two? That is God’s affair.

He applied the same concept to explain the ethos of competitive settlement among merchants and craftsmen:

If there are five ironsmiths next to each other and a tribesman comes wanting his plough fixed, no one calls out for the client to come to him. That would be improper [hshu-md]. You say nothing and the person will come [[../../../hshu-][to who]]mever God has chosen. Of course if you know the way things are done [qa‘ida] and deal fairly and politely with people they may do the same with you. But whether they actually do so is also God’s affair.

In Morocco, the concept of God’s will also emphasizes the limits of responsibility of one man for the moral and economic fate of others. Their fate is God’s; and each man looks after himself (ydebber rasu).

God created differences among people. And of many who are young [he referred to some nephews in their twenties] , they still have time; they will learn. Let people do as they want. God distinguishes between them. A Muslim’s duty is just to show people the path to those who wish to be with God, and that is that. Either they take it or leave it. The Prophets allow them the choice. There is paradise and there is hell, and God will select who goes to each. (A Makhzen official)

Men are bound together by multiple social obligations, but these tend to be particularistic. There are abstract, normative obligations incumbent upon each member of the Muslim community (umma) to aid other Muslims, but these obligations tend to be stylized. Thus, almsgiving (sadaqa) , an obligatory precept of Islam, tends to be performed on such occasions as the day of ‘Ashura, a feast day in the Muslim lunar calendar on which a tithe is given to the poor, on market days when beggars make the rounds of merchants, and frequently when one is about to undertake a long and arduous journey. The limit of men’s responsibility toward one another is illustrated by the fact that many rich merchants and notaries in Boujad, all considered pious Muslims, made fortunes in the famine of 1945 by purchasing land from tribesmen and houses from townsmen for a few measures of grain, turning tribesmen into sharecroppers and townsmen into tenants. Since the allocation of men’s fate is God’s affair, no Boujadi-s suggested that this sort of action was ruthless or morally objectionable.

At least on occasion, many Boujadi-s recognize incongruities between what they perceive as fundamental Muslim ideals and “the way things are” (qa‘ida), but this perception does not lead to any significant tension between ideal and real. Even in the interior of the mosque, where informants insist on the absence of inequalities of Muslims before God, men of prestige tend to have their customary places of prayer, which men of lesser prestige avoid. In small quarter mosques, the presence of a man of stature during evening prayers often causes the mosque to be avoided by men of lesser stature. On one such occasion, I asked a Boujadi I knew well why he abruptly turned away from a small quarter mosque he regularly attended without saying his evening prayers. He simply denied that the incident could have taken place, since normatively it should not have. Emphatically, however, the incongruity between norm and conduct constituted no dilemma

for my informant.

There are several ways in which incongruities between “the way things are” and Islamic ideals are made reasonable. One is to say that the world at present is defective or corrupt (khayba’):

These times are rotten [had l-weqt mkhasser^. No one wants religion now. Everyone wants the path of money. Once a notary [‘adel] was a learned man; now he is just anyone with connections and money to buy the post. It is a game. (A Makhzen official)

Everyone wants to show his influence [kelma]. The Minister [wazir^\ has a sofa as high as your knee; so the qaid wants one as high as your chest. This has been the state of the world since Adam. (A broommaker)

Such complaints reverberate throughout the writings of centuries of Moroccan historiographers, indicating that they are not peculiar to the last few decades (Levi-Provencal 1922).

A complementary explanation of incongruities is to claim that some professed Muslims are ignorant of what Islam “really” entails. Islam literally means “submission,” and an “ignorant” person (jahel) is one who is uncontrolled and unsubmissive, a slave to his passions.[61] Sometimes individuals are so characterized, but just as often the term is applied to entire categories of persons. The assertion that many do not abide by the Islamic code of conduct then makes comprehensible the present imperfect state of the world:

Those people in the countryside, those ignorant people, what do they know of Islam? They don’t pray or fast. They just live like animals: sleep, eat and work, and give grain and animals to any con man [gheddar] from the zawya or a brotherhood. (A merchant, once prominent in the Istiqlal [Independence] party)

Another educated informant made the following comment about the widespread belief in marabouts:

These stories of the marabouts bringing Islam to the Maghreb, they are all lies. People use them just to collect money from the ignorant. Islam came to the Maghreb with ‘Uqba ben Nafi.[62] People converted, but they did not remain Muslims. ‘Uqba was near Tangier when a soothsayer [kahen. “one who practices magic”] approached him and killed him. People did not stay Muslim until after the time of Mulay Driss.[63] But most men are still ignorant. They do not know what is and is not Islam and what their ancestors did and did not do. So they are happy for someone to tell them stories about marabouts.

Those who assert that they really “know” Islam feel under no obligation to dispel the ignorance of others. If others want to change their way of thinking and acting, that is God’s and their own concern. Each man looks after his own interests and takes the world as it is.

Islamic precepts are acknowledged as ideals but are peripheral to social action in this world because they are unattainable. A man's attention is directed away from an ideal normative state of affairs: "God has given that which is [had esh-shi Ui 'ta Allah, had esh-shi Ui kayri]."

*** Reason as a Social Concept

Since the pattern of events of any given moment is divinely ordained, the "reasonable" man sets about perceiving the multiple empirical ties between persons and adapting them to his interests as best he can. All formal roles—kinship, political, religious, and economic—are open to a wide range of negotiation as to their exact parameters and contents.

Reason (^qal) is the capacity to discern the meaning of social action and, on the basis of this perception, to engage in effective social action. It signifies adroitness or cleverness, without the pejorative English connotations of the latter word, more than a capacity for dealing with abstract rational phenomena. Its possession assumes an empirical knowledge of and capacity to manipulate the shared code of conduct called the qa'ida, "the way things are done."

Reason enables a man to perceive what will pass as acceptable and approved conduct in the management of his various social obligations to kinsmen, neighbors, merchants, and clients, men of influence and men without, and how to weigh these various commitments in relation to one another. The classical Arabic verb from which 'qal is derived can carry the meaning "to hobble a camel" and in other contexts can signify "confinement" or "control." These original meanings vividly parallel the contemporary Moroccan usage. Reason provides a man control over his nature (tbi'a) and passions (shehwat., sg., shehwa) within the precepts of Islam. Several informants explained this by citing a popularly known Qur'anic aphorism: "Man has reason. He distinguishes between that which harms him and that which doesn't."[64] Ordinarily the qa'ida provides a rough guide to "proper" behavior.

A majority of Boujadi-s ordinarily assume that the qa'ida is based upon, if not identical to, Islamic law (shra') in both its jural and its moral sense. In its jural sense, Islamic law is composed of those rules of conduct which in principle are enforced in a qadi's court: contracts and procedures related to marriage, divorce, inheritance, and certain property transactions. In its moral sense the Islamic law also prescribes the obligations of a Muslim: the five "pillars" of ritual prayer, fasting, pilgrimage to Mecca, alms, and the confession of faith that there is no God but God and Muhammed is his Prophet. In scholarly texts there exists a complex set of prescriptions for conduct, many based upon the Prophet's life. Few Moroccans know these in any detail. In its more popular sense as a code of conduct, Islamic law as popularly understood glides imperceptibly into "the way things are done" (qdida). For Boujadi-s who distinguish between them, shra? usually refers to specific, known precepts of Islam, while qa'ida refers to more generalized patterns of acceptable conduct: styles of greeting, bargaining, and other expected forms of deference and civility in the conduct of social relations. Most Boujadi-s, however, tacitly assume that Islam is what Muslims do, or should be expected to do, and thus merge the two concepts.

The shra' and qa'ida as popularly understood together provide

“recipe” prescriptions for acceptable social action. The shra’ is considered ideologically to be immutable, and many Boujadi-s will make similar claims of the qa’ida. Since the latter is unwritten and the former is inaccessible in written form to virtually all Boujadi-s, there are, however, no effective criteria by which the claim of immutability can be demonstrated. Thus, from an analytical point of view the code of conduct is responsive to the shared, constantly renegotiated universe of meaning within which Moroccans live and is amenable to transformation.

Men acquire reason as they assume a greater autonomy in the social world. Thus, at birth a child has no reason at all and in this respect is indistinguishable from animals.

How could a child have [reason] ? When he is born he has absolutely nothing. How could he know the shra^ Islamic law doesn’t rule [ta-yhkem] over him; it doesn’t control his conduct. Reason grows in the child when he learns to distinguish, to weigh [his actions]. When he is small he will put his hand in the fire because he doesn’t know it will burn. When he grows older—by Islamic law when he is eighteen [szc]—he has reason. But God gives reason earlier to many children.

To have reason means that you must know the Islamic law. You must pray and fast. A good father will teach these things to his son beginning at the age of seven—take him to the mosque, encourage him to fast at least part of the day during Ramadan.

First you try to lead him by words, later with beatings if he doesn’t listen. If he disobeys you and doesn’t begin praying and fasting, then people will say of the father as well that he doesn’t have reason. (A shoemaker)

Reason is considered more likely to be fully developed in men than in women. This is not due to any innate masculine capacity, but to the fact that the activities of a woman are confined primarily to her household and quarter. Hence a woman’s reason, or ability to engage effectively in a wide range of social relations, is, like that of children, considered to be less than that of men. Some women are cited as exceptions, but the general rule is unquestioned. This is not to say that women lack power. Within their own sphere they are recognized as having formidable capacities for action. Women are often thought to be familiar with magical acts and other practices only dimly known by ordinary men. Being less restrained by reason, women are fully able to draw upon these resources in pursuit of their interests.

Men have reason and know how to get what they want. They are not quick to run to the Makhzen and to the street when their child gets a bloody nose. If a woman sees her child fighting in the street, she joins in without asking what has happened and is ready to fight another woman. They don’t have heads. (A Sherqawi grain merchant)

A man will think. He sees the quarrel leading to the Makhzen; he knows the other man has more “pull” [shoqa] with the Makhzen than he does. He knows how to deal with people bigger and weaker than he is. A woman is light-headed [khfifa]. She doesn’t know how to do these things. If she goes to the biru [French bureau, government offices], who pays attention to her? Better that she stay at home, where she can teach her daughters to cook and sew. They don’t know Islam like

men do; they even have tricks to avoid fasting. (A vegetable-seller)

You must keep a close watch on your women and children, because their reasoning is weak. If you don't want to see a man and you tell your wife and children to say you're not at home, they will say to the man that you are home but told them to say that you aren't. Or if you want them to keep quiet about a fight, they won't be able to. (A schoolteacher)

From the vantage point of townsmen, tribesmen are another category of persons deficient in reason. Since reason is judged by the ability of a person to demonstrate knowledge of "how things are done" in relevant social contexts, tribesmen often are somewhat handicapped in town settings. While most have multiple ties with kinsmen and others who have migrated to towns, these ties are usually less effective than those available to townsmen in facilitating commercial, legal, and administrative transactions.

Since most tribesmen are illiterate, it is easier to deceive them and to make them act in an "unreasonable" manner in urban settings. Especially bewildering are the mechanics of court procedure. Parts of the court sessions are in classical Arabic (as when the judge dictates to his clerk). Most townsmen also find classical Arabic hard to follow, but they can anticipate actions in court more successfully. In the Islamic law courts, plaintiffs and defendants must have depositions prepared on their behalf. Even the rare literate tribesman has difficulty in understanding these documents. Since notaries are paid for each document they prepare, they often knowingly allow tribesmen to commission and bring before the court documents that are without judicial merit. The entire process is seen as unpredictable by tribesmen, and tempers flare in the courtroom. One qadi said: "Most of the cases in my court are from the country, because country people have less 'qal than townsmen. They don't know how to deal with each other; so they fight openly and end up in court."

Another sign of men who lack reason is a futile public display of anger. In court, for instance, tribesmen often challenge the judge to throw them in prison after they have been ordered to support a divorced wife. After one such outburst a qadi said: "What do I care if he goes to prison or not? If he had reason he wouldn't say that." The implication is that a man with reason would recognize the futility of his loss of self-control.

Reason concerns the "inner" state of a man only in so far as he has the ability to exercise control over his impulses. Proper conduct is linked principally to efficacious performance in the social order, not to one's inner state or to abstract moral or ethical principles. Emphasis is placed on the ability of a man to control whatever "natural" impulses he might have and to present a "wide-awake" alertness toward social obligations and social action. The conduct of a reasonable man shows "balance" (mizan) the ability to calculate a course of social action in relation to its consequences for a total network of social relations.

For example, by Islamic law certain individuals have fixed rights in inheritance from certain relatives. One Boujadi, in a client relation to an elder brother much more prosperous than he, described how he acted at the division of his father's estate:

I did not demand my share of the inheritance and choose which of his possessions I wanted.

So that we would remain on good terms [bqa‘qalu], I told my brother to leave my share in a corner, and I would come and pick it up later. If I fought or tried to have influence [kelma], I might get a larger share, but my brother would no longer help me.

Ideally, the reasonable man is taciturn and not prone to listen to gossip or allow “everything in the market” to enter his head. Nevertheless he keeps close tabs on the actions of others while giving the impression of a man who keeps his own counsel and weighs the consequences of his actions. Again, he is in full control of himself and never acts impulsively:

If a reasonable man is in a group of ten or twelve people he will say only a few words, but each of these words will be weighed. You talk of high things. You do not say that Fulan [the Moroccan equivalent of “Jones”] was here and Fulan was there and he said this and that. You speak, but within the code for conduct [qa‘idd]. A green-headed person [kheddar][65] who runs from one shop to another carrying stories of what people are doing is without value. After all, how do you know whether that person is saying what he has heard or not? What is his objective ^gharadJ] ? If you act on what he says and later find out that he lied, he will deny his words. It is another matter if you always deal [te-tsaref] with another person, and drink tea with him. Then a man is more likely to tell you something reasonable. Which is better, something you buy for ten ryal-s, or for fifteen? People are like that too. (A graintrader)

If you say everything you know to a man who is your friend, that is fine as long as he remains your friend. But you might quarrel tomorrow, and then he will harm you with his knowledge. Do you know the story of the dove? She had her babies in a nest high in a tree. She cooed and a snake heard her, climbed the tree, and ate the children. (A carpenter)

A shoemaker described a situation in which a local government clerk paid less than the generally understood price (qa‘ida) for some repairs:

I did not tell him directly that he owed me more. If I did he would have been embarrassed [Zd-yhsherri). He would have paid, but the next time I went to the Makhzen to ask for something, he would have remembered. I might have had to wait for days to get his attention. Instead when he next came to me I said I had no leather. Then from another shoemaker he learned the price and realized why I said I had no leather. Then he paid my due. So he was not embarrassed, I got my price, and there is nothing [i.e., no friction] between us. He knows me as a reasonable man.

Since open disagreement or the direct refusal to comply with someone’s request both have the effect of challenging his status, the reasonable man attempts such a challenge only after careful calculation:

If you want me to go to the other side of town I will agree when you ask me, but will then go and sit in the house or at the market where I always sit. The next day you will ask me why I didn’t go. I will tell you that my brother came, my legs hurt, or some other such thing. You know that my brother did not come and that my legs are good, but you will understand that I had some reason for not going. I want you to be well-disposed to me and

was embarrassed to say “no” to your face. I say “yes” to avoid friction \le-mhakka), and thus your “reason” is not “broken.” (Owner of a public oven)

Reasonable men do not stand on absolute rights or wrongs. They accommodate themselves to social realities. They make themselves aware of ongoing changes in the shared cognitive map of the social universe and realize that the “rules of the game” call for constant, active negotiation over the content and contours of that map. This understanding of the world should by no means be taken for the amoral opportunism by which Edward C. Banfield characterizes the world view of Sicilians (1967). Moroccans place a great value upon maintaining the proprieties of the social order. Thus, to “break” the reason of another person, as in the above quote, is to challenge the assumptions of social ranking implicit in his conduct. Even when such challenges are deliberate, the reasonable course is to proceed whenever possible by indirection, leaving room for face-saving maneuvers on the part of those who stand to lose. As social positions are changed, the attempt is made to do this with minimal overt confrontation.

Since social honor is ephemeral, one’s situation is easily liable to reversal.

The most significant expression of reason and its relation to the Islamic code of conduct is in the complex symbolism associated with the month of fasting, Ramadan. Ramadan and the rituals associated with it are thought to sum up much of what it means to be a Muslim. For most Moroccans, it is the period in which Islam is most consciously brought to play in daily routines.

Some neo-orthodox modernists (Salafi-s) erroneously claim that Ramadan separates those who deal with marabouts from those who “know [formal] Islam.” This is empirically false. For the majority of tribesmen and many older townsmen, dealing with marabouts and participating in formal Islamic rituals present them with no intellectual or moral contradiction. Moreover, fasting is as widespread in the countryside as in the towns. Equally misleading are the interpretations of the nationalist press, which carries articles, curiously taken mainly from the writings of an earlier generation of European orientalists, which view Ramadan foremost as a diacritical mark distinguishing between Muslims and Christians, or justify the fast by its supposed medical virtues. Neither of these interpretations, however, is particularly widespread.

For most Moroccans, the celebration of Ramadan distinguishes men with reason.[66] Throughout the year there is, of course, an elaborate Islamic ritual cycle which includes five daily prayers, communal prayers on Friday, a feast marking the end of Ramadan (Td es-Sghir or Td le-Ftur), and the Great Feast (Td le-Kbir, the Feast of Abraham), among others. In principle, the Muslim community as a whole participates in these various rituals, although in practice they are primarily activities of adult, urban males and some members of the rural elite. In contrast, the rituals associated with Ramadan are performed by the entire Muslim community, except children, pregnant women, and others excused for reasons of health.

To Boujadi-s, the fast implicitly symbolizes the capacity of man to regulate his nature and live by the rules of society which God has revealed through his Prophet. During Ramadan, as at other times, there is no denial of man’s passions or appetites. Between sunset and early morning, life is carried on much as usual, except that those who ordinarily drink

alcoholic beverages cease to do so for the entire month.[67] Those who smoke will abstain during the day. Fasting during the day dramatically symbolizes man's ability to discipline his desires in accordance with the arbitrary code of conduct laid down by God. Men's capacity to follow the divine model reaffirms that they are not bound by their passions to live in a totally anarchic world. Daily prayers also symbolize the divine template for conduct, but Ramadan is recognized as a more intensive, sustained discipline of human nature. Although work habits are modified to alleviate the physiological tensions which accompany fasting, tempers often run short. Most people will, however, try to show their reason, and hence their capacity to follow the Islamic code of conduct, by avoiding situations in which they lose their self-control.

*** Deference and Propriety

Reason grows in a person with his ability to perceive the social order and to discipline himself to act effectively within it. Proper social comportment within this framework is symbolized by the concept of theshsham, or hshumiya. These terms approximate the English concept of propriety (which is the translation I give to the terms when used in the abstract), although they are also used in contexts where the English terms deference, respect, circumspection, and occasionally embarrassment would be fitting.

The locus of propriety is not so much the inner moral consciousness of a person as his public comportment with respect to those with whom he has regular face-to-face relations. A person is said to lack propriety when he is caught outside the image which he is expected to project of himself before "significant others." Maintenance of "proper" comportment reflects one's possession of reason.

Like reason, propriety is a quality which persons acquire as they mature. It is inculcated by parents, especially the father, and to a certain extent by other relatives and outsiders. This is achieved both by suggestion and, on occasion, by the use of physical force. As a son acquires reason, he is expected increasingly to show deference toward his father in the household and in public.

Before boys are taken to the mosque and initiated in the fast, fathers as well as mothers play with their sons and show affection and tenderness (Jianana) toward them.[68] As a boy matures, only the women of the household, especially his mother, continue manifestly to display affection toward him. Mothers and sons develop strong, expressed ties of affection: widowed or divorced mothers frequently live with their sons and look to them for moral and economic support. It is believed that if a father were to continue to be affectionate with his son as he matured, the son "would become soft like a woman, allowing others to dominate him [st'amaru]. Thus the father increasingly assumes a greater formality with his son and becomes hard [qaseh] with him.

As a boy matures, he increasingly strives to avoid situations in which his father or other persons can exercise domination over him. This often entails tacit public avoidance of the father, even when the son continues to live in the same household. This avoidance continues after a son becomes economically autonomous and establishes his own household. It does not indicate active hostility so much as a desire to avoid situations in which the son, himself the head of a household, is placed in a position in which his own

“word” must be circumscribed. On the marriage of a son, the father avoids those aspects of the celebration which would bring him into direct contact with his son. He generally sits with his friends in a separate room, away from the female dancers (shikha-s’) and musicians usually called in for the celebration. Direct contact between father and son on such an occasion is thought to be highly improper.

Propriety is similarly related to subordination and restraint outside of the household. Among examples of impropriety are acts of adultery, homosexuality, or other illicit sexual exploits, at least if they become publicly known; fighting in the street; being caught in the act of stealing; and various forms of deceit and exploitation. These are considered less as “immoral” than as “improper” acts. It is their public knowledge which is the subject of greatest concern, since, as one Boujadi said, only God knows the true motivation of a person’s actions.

In women, modesty [le-hya] obedience to her husband, and the avoidance of any behavior which would publicly imply that she is not subordinate to her husband are principal elements of proper conduct. Sexuality in this case is, of course, heavily symbolic of patterns of deference.

As indicated in the above account of father-son relations, impropriety often arises when the will of one person is openly challenged or blocked by that of another, or when a person assumes a social role which others are not willing to accord him. Thus it is embarrassing to ask for something from a relative, associate, or stranger and to have the request refused. Considerable intellectual energy, especially involving the use of intermediaries, is spent constructing situations so as to avoid such overt confrontations.

As an illustration of the attention paid to such tactics, one informant explained why he never entered the house of a higher-ranking neighbor on his own initiative:

I was embarrassed [kont te-nehshem) [to do so]. He’s a big man in the Mak[[../../../kont][hzen.]]He might insult a less influential man or push him around if he doesn’t restrain his conduct in front of him. If you call at his house without being asked to come, he gets a bad idea of you and says that you’re no good or “uppity” \Jik sentiha]. Then he will push you around. That’s how big men [le-kobbar^ are, especially if they don’t know you. You must be respectful [heshman] with them.[69]

The nuances of propriety are elaborated in numerous ways. These include spatial hierarchies—from sitting at a distance from social superiors and avoiding unnecessary encounters with them, to being at an intimate distance to men of prestige. The seating patterns of guests at a meal and the order in which they are served give subtle nuances of hierarchy. The most precisely calibrated patterns of deference emerge in styles of greetings. Most informants are uncomfortable about explicitly discussing their implications, particularly those which reflect the most pronounced inequality. Ignoring a deferential greeting or unceremoniously rebuffing one underlines extreme social distance. Kissing the feet, or the hem or sleeve of another’s jellaba (a type of North African robe with a hood), similarly expresses extreme social difference. Sons kiss the hands of their father, uncles, and guests as an act of deference. The same greeting is also offered to certain officials. Some informants justify this by saying that officials are

representatives of the king and emphasize the latter’s role as God’s deputy (Jdialifet Allah fel-l-ard). Submission, they claim, is to the office, not the individual. Actual practice, however, goes far beyond deference to persons in their official capacities. It is extended to anyone to whom it is felt that deference is necessary or useful. To use an appropriate American colloquialism, you kiss the hand you can’t cut off. As relations of equality are approximated, reciprocal handshakes and embraces become common. Public acknowledgment of one’s place in the social order and proper conduct toward significant others implies primarily a circumspection and cleverness designed to avoid censure and heighten one’s chances of success in the social order.

To summarize the argument so far, the concept of God’s will directs attention to what actually happens in social relations and away from abstract considerations of why things are the way they are. Reason is the capacity to discern realistically existing, if ephemeral, patterns of dominance and deference in the social order and to act appropriately. Propriety entails the circumspection necessary to act within the shared code of conduct. The next concept that I will describe, obligation, indicates more clearly how these preceding concepts articulate with the social order.

*** Obligation

The particularistic social ties which constitute the fabric of the social order are contracted and maintained by the exchange of obligations (haqq-s). Men cannot control God’s allocation of success, but they can render the actions of other men, including marabouts, more predictable by contracting and maintaining ties of obligation. The nature of these obligations and the persons with whom they are held provide an index of social honor, although since the totality of anyone’s ties is rarely known, these indices must always be approximate. Haqq is a polysemic term which, according to context in colloquial Arabic, can mean “share,” “privilege,” or “obligation.”[70] One speaks of having an obligation “over” or “in” someone else (fih l-haqq^ ‘lik l-haqq). Some obligations are minimally prescribed by Islamic law and “the way things are done” (qa‘idd), such as certain obligations toward kinsmen and communal religious ties. Even these obligations can be fulfilled within a wide latitude of acceptable conduct.

A number of actions can initiate a relationship of obligation: an invitation to a meal, performance as a go-between, or any other service or assistance. An obligation contracted by one means, such as service as an intermediary, need not necessarily be reciprocated in the same form. Obligations can also be contracted by omission: a missed appointment (at least between individuals of nearly equal social honor) creates an obligation on the part of the person who failed to keep the appointment. The mere offer of a service or support imposes obligations as effectively as an action actually performed. Even exchanges of greetings, by their complex code of gestures and manners, impose obligations, since they publicly assert what one person would like the other, and observers, to think regarding their relations.

Obligations are not directly convertible into cash. In the context of a regular, multifaceted social relationship, such an insinuation would be considered base and vile (duni). However, if there is no viable bond with the person being approached, a “sweetener” (Jilawa) or bribe (reshwa) is part of accepted, even if not condoned, social practice. The term reshwa, for example, also designates the nonreturnable gift, which, apart from the bridewealth (sdaq), is given by the groom to his bride’s father in order to expedite consent for the marriage. In

themselves, such cash transactions are not considered immoral. Theoretically they can be considered to be the limit case of haqq relationships in that they imply a one-time reciprocity. Baseness is generally attributed to such transactions only when the price exacted is considered abusive in light of the resources of the person making a request or when that person is capable of performing a reciprocal service of value at some later time. In the latter case, it would be considered both brash and lacking in reason to demand cash. There is a moral component here, but most informants emphasized the propriety, not the morality, of such situations. Another form of one-time exchange is the immediate reciprocation of an obligation, such as an invitation to a meal, with one of equal value. Such action often signals a desire not to enter into an ongoing relationship. An overt display of this intention is regarded as improper.

A category of transaction that falls outside the sphere of obligations is called fabor, which literally signifies a gratuitous act. The term fabor probably derives from Mediterranean port sabir, or lingua franca, rather than directly from the Spanish favor (see Lanly 1970). Its foreignness suggests that it is peripheral to the conduct of social relations in Morocco. The term fabor is often used in requesting alms from foreigners or in demanding services which the supplicant cannot reciprocate. Ideologically, the giving and receiving of alms (sadaqa) between Moroccans are also outside of the calculation of obligation. Nonetheless, an implicitly triangular reciprocity is involved. Beggars ask God or a marabout to repay the donor on their behalf. The same sort of triangular relationship is initiated in making a request to a person of much greater prestige.

Similarly, a man to whom God has allocated prosperity is supposed to be generous (krim), taking what God has given him and willingly distributing it to others. Such generosity (karama) manifests itself in largesse to guests, in such pious works (ihsari) as the construction and maintenance of mosques or orphanages, or—to indicate the flexibility of the concept—in provision for the salary of a trainer for the local soccer team. Such acts directly contribute to a man’s social honor by legitimating his wealth but are not considered to entail specific reciprocal obligations on the part of those who benefit by them. “There is no bill for karama in this world,” as informants say, but karama, while not explicitly considered by Moroccans as an obligation, follows the same principles. To accept the generosity of someone without being able to reciprocate is to confirm the superior status of the donor.

The complex web of personally contracted bonds of obligation by which society is knit together is always asymmetrical. All relationships impose obligations of calculable intensity. The dominant partner in such a tie is said to have “word” (kelma) over the other. The relation is that of patron-client if it is fairly regular and marked by such pronounced inequality that the client cannot reciprocate with services of equal magnitude. “Word” exists even when the relationship is much more finely tuned. There is a carefully nuanced vocabulary and repertoire of gestures for the discussion of these gradations, which depend on a wide range of such factors as education, wealth, kinship ties, and networks of obligations held or thought to be held with others.

The reason why dominance is so coveted in this system is that it allows a man to be autonomous, to assert his claim to be a full social person. In so far as a person is obliged to defer to the wishes of others, his autonomy and social honor are diminished. All members of the society utilize the skills and resources available to them to compete for dominance. Thus, the head of a household wants formally to assert his dominance over its other members. The comportment of wives, sons, daughters, kinsmen, and servants associated

with his household affects to a certain extent his own social honor. The comportment of these individuals is expected to be orchestrated as far as possible with his own interests or at least (especially in the case of adult married

sons in his household or already living apart) not publicly discordant with them.

There is a specific avoidance whenever possible of relationships which entail a sharing of authority or of responsibility with other persons, such as partnerships in a business enterprise or the sharing between certain relatives of a household. The popular proverb “A thousand debts before I become anyone’s partner [alf medyanin u-la meshruk]” is to a large extent borne out in social reality.[71] The reason for this avoidance of partnerships is that, in relations of near equality, the “word” (kelma) of a person is more easily called into question. Since each person strives to have “word” in social relations and at the same time tries to minimize situations in which he is obligated to others, the near-egalitarian relations of obligation contain a continual, inherent tension. Necessity often demands that a person enter into definite relations of deference to others, although in some circumstances such a tie (as when a person is known as factotum for someone of much higher prestige) can be a means of advancing social honor.

In general, the reasonable individual strives for flexibility in relations in which he is under obligation to others, while at the same time fixing as firmly as possible relations in which he holds obligations “over” other individuals. Since by God’s will “the way things are” is constantly in flux, an individual strives to be as free as possible to change the weight of obligations within his personal network, yet to remain within the bounds of propriety.

The vocabulary used in speaking of relationships of obligation implies this ledger concept of exchange. One term frequently used to indicate a contractual relationship of obligation literally means “to exchange” (tsaref, n., msarfa). Persons who “exchange” with each other are called “companions” or “associates” (shaty sg., sahety., a term which in itself carries no connotation of affective relations. It simply describes persons who regularly deal with each other. This is not to argue that affective relations are nonexistent or unimportant in Moroccan society. They are, however, decidedly subordinate to relations of obligation. A person who jeopardizes his own interests in steadfastly supporting another is often considered “unreasonable” or, in other words, defective in his cognitive map of the realities of the social world.

Below is a typical example of how obligations are contracted, slightly edited, from my field notes. It is so commonplace, undrama tic, and “trivial” to Moroccans that none of the actions described needs explanation to be intelligible. It is remarkable, however, in that one of the participants in the events, here called Hmed, was aware of my work and willing to interpret what he understood of his own role in the incident and those of the other actors.

In [a town adjoining Boujad] I was in the large American car of a wealthy local official, Hajj Saleh, who made his fortune by buying land during the famine of 1945. With us was a recently arrived official, Hajj Hmed, who in the Makhzen was the immediate superior of the car-owner, but inferior in wealth and—at least for the moment—local influence. Also in the car was Bu ‘Azza, a moderately prosperous tribesman who had come to seek the advice of Hajj Hmed. Near the market, we passed a man with a few chickens. Hmed asked Saleh to

stop the car so that Bu ʻAzza could run out and buy him a chicken. “These [name of tribe] really know how to buy chickens,” Hmed said as he watched the transaction from the car. When Bu ʻAzza returned, a scruffy-looking individual followed him, put his head in the window, and said to no one in particular that Bu ʻAzza owed him 80 ryal-s. Bu ʻAzza said nothing. Saleh, ignoring the intruder, told his driver to proceed. The driver sounded the car’s deafening bus horn to clear the road of carts and pedestrians and began to move. No one in the car made any overt sign of being aware that the man’s head was still in the window in an effort to keep the car from moving and settle the transaction. Then Hmed asked Saleh to stop the car, said to Bu ʻAzza’s alleged creditor: “Here’s 20 ryal-s of the debt,” and diffidently threw the money out the window. Again the car started, but this time Bu ʻAzza asked for a halt so that he could pay his creditor the other 60 ryal-s.

According to Hmed, Bu ʻAzza, the tribesman, was sent to bargain for the chicken, because at the time he was in a relation of obligation to Hmed. Since Bu ʻAzza did not know whether Hmed would pay, he could be trusted to argue for the lowest price possible. (Hmed repaid Bu ʻAzza for the chicken shortly afterward.)

In paying Bu ʻAzza’s debt, Hmed did not know anything of its nature or whether a debt existed at all. The individual to whom the money was given was in his eyes a beggar, one unable to reciprocate. The money given to him was thus karama, that is, the passing on of God’s bounty with no anticipation of repayment. Such an act gives a man a claim to high social honor in the eyes of other Muslims.

Later my informant, Hmed, spoke of his relations with his subordinate official, Saleh. There was no question that Saleh could manipulate officials to his advantage both locally and in Rabat. Hmed, as Saleh’s bureaucratic superior, faced the delicate problem of having to treat Saleh as a person of the same level of prestige. Hmed’s tone and gestures never became peremptory with Saleh, as they did with other subordinates. No direct assertion of “word” was possible; informally Saleh, while not as well educated or as smooth in his etiquette, dress, or speech, was decidedly more influential. The fact that Hmed was riding in Saleh’s car rather than his own reflected this. Significantly, however, he performed an act of karama in front of Saleh and other witnesses, while Saleh attempted no such gesture. Hmed, by performing an act which Saleh showed no sign of undertaking, tacitly asserted a higher social honor.

The action reported above had another meaning in relation to Bu ʻAzza. For him, the payment on his behalf put him in a further relation of obligation (haqq) to Hmed. By asking something of Hmed and later having a part of a debt paid on his behalf, he became Hmed’s client, under obligation to perform a service for him in the indefinite future. At the time of the incident, Hmed had no such clients locally and needed them to ensure the flow of information necessary to perform his functions.

The modalities of initiating ties of obligation are particularly clear in the case of encounters between individuals from different parts of Morocco, where mutual knowledge of social networks and individual abilities is incomplete or only circumstantial. A local Makhzen official spoke of how, when he first arrived in Bouj ad, some Sherqawa tried to put him in a relation of obligation.

They invited me to a meal. I could not refuse. They, and others later, would kill one sheep, sometimes two. A few days later they came to me and asked that some documents be changed. Another time they brought an entire tribal council [jmda] and grain and sheep for me. I didn't even know for certain how much "word" they had. They tried to embarrass me [t-hashemni] into helping them get whatever they wanted.

Persons are expected to reaffirm continually those ties which they want to maintain. Some key occasions when such reaffirmations are expected include marriages, births, and deaths; the graduation of a son or daughter from school; completion of a child's studies at the mosque; departure for and return from the pilgrimage to Mecca; and religious feast days. Neighbors, associates, relatives, and anyone with whom there is an ongoing social tie are expected to acknowledge such occasions by congratulations, a gift, or attendance at the celebration. Receptions for such occasions invoved nuanced indications of the guest's prestige: whether a meal is offered or simply tea, seating arrangements, the order of eating (often there are several sittings), and marks of attention from the host. Merchants and others also stay at or near their shops for part of the day in order to exchange greetings on the street with persons more distant to them.

All occasions except death are accompanied by the giving of gifts (hdiyya-s). Depending on the prestige claimed by the household, the gifts are paraded through the streets on trays on the heads of women, on carts, or on an open truck. Women, children, and, for wealthier households, musicians join the procession. In the case of marriage, the formal justification for this display is that the gifts indicate the standing of the households involved. Prestige is reflected in several ways—the size of the gifts, the identity of the donors, and where the procession is allowed to circulate. On the marriage of his son, a powerful landowner arranged for a procession which passed through all the town's main streets and lasted for hours.[72] Less distinguished processions are generally confined to one or two adjoining quarters. A wider circulation for modest processions is considered improper (hshuma). It would suggest the lack of reason on the part of the head of the household, who would be subject to ridicule for such pretension.

In the contracting of obligations, men take care to avoid situations which might call into question or limit their claims to prestige. A direct, open refusal to a request characteristically signals an indifference to or open challenge of the tie of obligation which links two persons. Hence a premium is placed on the use of intermediaries (wasita-s) in order to avoid such situations.

The selection of intermediaries depends on the issues to be negotiated and the stature of the parties involved. For instance, matters publicly supposed to be beneath one's attention, such as delayed rent payments by a tenant, minor disputes over prices, or negotiations for which the outcome is uncertain, are managed by entrusting them to a servant or client. Should there be a refusal or lack of direct compliance for any reason, both parties (depending on their relative standing) can deny their original messages and produce more suitable ones.

Some examples can indicate the range of choice involved. In dealings with the Makhzen, there is often a grey area in practice (as opposed to law, in which there is a strict separation of powers) between local officials of the Ministry of Justice and those of the Ministry of the Interior. Interior officials are present at each rural market, while qadi-s and civil judges are located only in the larger towns. Many tribesmen fail to distinguish between the formal authority of the two ministries, since in the

protectorate qaid-s also had the authority of civil judges. In addition, court cases often involve considerable travel and expense, since they take place only in town. Hence tribesmen frequently submit judicial disputes to agents of the Ministry of the Interior, who deliberately set their fees lower than the cost of formally presenting cases to the courts. Such decisions are legally unenforceable, and the Interior officials often err in interpretation of the law. Particularly when they fear that disgruntled litigants might later bring their case before a court, Interior officials who administer such informal justice send go-betweens of no formal standing to the judges with “hypothetical” cases to determine the law. This avoids direct friction (mahakka) between the officials involved and direct challenges to their authority. Judges usually refuse to cooperate, but, if a go-between is carefully chosen, they sometimes feel compelled to give advice.

Negotiations over marriage similarly require careful selection of intermediaries. Occasionally, when only kinsmen are involved, the suitor asks the father of a girl directly. However, women are most frequently used as intermediaries in such negotiations, since any messages they communicate can be conveniently denied by both parties involved.

Failure as an intermediary in such an enterprise constitutes an obligation that must be repaid. When a local school official wanted to marry the daughter of a prosperous local merchant, a friend offered to secure the consent of the girl’s father and assured the school official that he would not he refused. He later was refused. When other townsmen learned of this, the school official was severely embarrassed. Because of the public knowledge of his failure, the intermediary owed a major obligation to the official. He settled it by offering his own daughter and settling for a token bridewealth. Not to have settled the debt would have led to a break in relations between the two men.

*** Compulsion

A serious breach in relations of obligation, such as described above, or the need to oblige a person to come to one’s aid or serious threats to social honor can lead to placing a “compulsion” (’*ar*) upon the person responsible for creating the situation or capable of restoring satisfactory relations. Metaphorically, compulsion is thought of as a weight which can be “thrown” on a person or group. Once “thrown,” this weight can be “lifted” only by performance of the action requested.

Westermarck in Ritual and Belief in Morocco defines ‘ar as a “conditional curse” with supernatural sanctions (1926:1, 518). Supernat- urally inspired disasters are thought to occur to persons or individuals who do not respond appropriately to a request placed in the form of ’*ar*. Because of the serious consequences thought to follow its use, the ‘ar is not lightly invoked. Proverbs justify the use of indirection so as to avoid such situations: “Deceit is better than the ‘ar \l-hila hsen men I-ar]” and “Cleverness conquers the lion [l-hila ta-teghleb s-sbe‘]” ’ ’

There are two types of compulsion, the “great compulsion” (‘ar kbir) and the “lesser compulsion” (‘arsghir). The ‘ar kbir^ which virtually disappeared upon the establishment of French control, involved the mediation by marabouts or their descendants of disputes between tribes, tribal sections, or local communities. The prestige of the marabout called upon was commensurate with the gravity

of the dispute involved. At least ideally, marabouts even interposed themselves between contesting groups to bring about a cessation of hostilities. Alternatively, the flag from a "dead" marabout's sanctuary or the cloth shroud (ghota) of his tomb, carried by one of his descendants, could be used to compel a truce or settlement. The 'ar kbir was also invoked if a caravan escorted by a Sherqawi was attacked.

"Lesser" 'ar, the only form which presently exists, involves individuals placing each other in situations of compulsion. Compulsion invoked by a descendant of the Prophet or a marabout is considered especially serious, but other persons can use it as well. It is often used to bring an end to disputes involving divorce, court actions, and major threats to social honor. Serious cases of compulsion may involve the public sacrifice of a sheep at the door of the person being compelled or the placing of one's daughter in his protection. Less dramatic but nevertheless effective forms of compulsion include public gifts of large amounts of sugar or a public request on the supplicant's behalf by a respected descendant of a marabout or the Prophet.[73] The same principle of compulsion is implied in the carefully constructed phrases of deference and flattery (zsri'ar)[74] employed in the opening lines of written letters and requests. The intent of such phrases is to compel an individual to respond favorably to whatever the supplicant requests by reminding him of his social honor and implicitly suggesting that a refusal would be beneath the station of the one being so compelled. This practice also has its face-to-face equivalent.

'Ar can be construed as an extreme form of obligation (haqq') which is employed only after other forms of obligation fail. 'Ar merely compels the restoration of relations or the performance of a requested action; its imposition implies no judgment on the rights and wrongs of the situation which led to its use in the first place.

Like obligations, 'ar can be invoked only for situations which fall within the limits of propriety. It cannot be "thrown" for trivial reasons or for goals not sanctioned by "the way things are done." Within these limits, it is considered against reason and improper to resist a request made by 'ar. A Boujadi informant raised in a nearby town gave an example of 'ar which occurred in the late 1920's:

My father [a pious notary] was regarded by the neighboring tribes as a marabout, although he was not. Because of his reputation the French got my elder brother [also a notary at the time] to help them establish the rural tax [tertib] in the region. The tribes brought it to our house, thinking it was the tithe ['s/zzzr].[75]

Then the French appointed [an in-law of Pasha Hajj Thami 1-Glawi, pasha of Marrakesh] as qaid of the region.

He was a rough, ignorant man. One day at the market, the qaid slapped my father on the face before everyone, when my father refused to listen to his words. Later a friend of the qaid told him of my father's reputation and warned him that the tribes might rise up against him.

At the next market the qaid brought his daughter. Before everyone he went to my elder brother and said, "She is yours. Take [i.e., marry] her. She will never return to my house."

That was ‘ar. The qaid asked for no bridewealth, although later my brother paid something so that there would be a marriage by Islamic law.

An essential component of using compulsion is that it must be done publicly, as in the above case. The person initiating compulsion must be fairly certain of approbation for his activities. Refusal of such a request indicates a heedlessness toward potential disaster and a serious breach of the social order.

The following example of the use of ‘ezr, taken from my field notes, is more mundane but exhibits in fuller detail the circumstances leading to its use.

Two teen-age girls got into a fight on the street and began hitting one another. A third girl from a neighboring house intervened, trying to break up the quarrel. The young brother of one of the girls came by and immediately rushed to the aid of his sister. He entered the house of the girl who had tried to break up the quarrel and struck her in the stomach. Then he dragged his sister home, slapping her for getting involved in a street fight in the first place. Meanwhile, the girl whom he had struck had fainted.

Neighboring women came to sit with her and brought small gifts. When her father returned, his first act was to take his daughter to the doctor to get a certificate confirming that she had been injured. Since there were no injuries, he was unsuccessful. Further, the gendarmes refused to intervene without such proof of physical harm.

The morning after the fight, the father gathered witnesses to make depositions with the qaid. This was the first step in bringing the matter before the civil court. The charges deposed were assault and siba,[76] which in this case meant entering another man’s house without his permission, a very serious matter, since it affects his honor and that of his women. Some of the witnesses, all women, dropped out on pressure from their men, who feared being caught in the middle of a protracted conflict between neighbors.

Weeks passed, with the father of the struck girl trying to line up everyone who could potentially intervene on his side (the judge was one of his distant kinsmen) .[77] The other girl in the original fight, the servant of an important household, was beaten for getting involved in the first place. Her master, of much higher social rank than the father of the girl struck by the boy, refused to lend his support on the ground that the quarrel was none of his affair and that, since it was a woman’s quarrel, no one could tell what really were the issues. (He would also have lost prestige in lending support to the minor quarrel of a client household.)

After the case was finally docketed, the father of the boy then came to the door of the girl’s father at sunup, together with some of his friends and a gift of several cones of sugar. He asked for a suspension of hostilities [*sulh*]. Without opening his door to confront his opponent face-to- face, the girl’s father refused settlement on the grounds that the court date was already set. The first attempt at ’*ar* was unsuccessful.

Several days later an old, influential Sherqawi, a distant relation of the girl's father, came, together with some friends of the boy's father, on behalf of the latter (who was a commoner). The Sherqawi intermediary kissed the girl's father on both shoulders. He again offered the gift of sugar, asking that the matter be dropped. This time it was. The girl's father later told me it would have been improper \hshuma] for him not to have done so. The intermediary was carefully chosen by the supplicant as being in the social network of the girl's father and higher in "word." A refusal by the girl's father to drop the dispute would have asserted that the intermediary who came to him was insignificant and thus would have created a formal, open challenge to this other individual as well.

*** Common Sense and Religious Sense

The common-sense perspective toward "the way things are" is the overall one through which social experience is shaped and interpreted. As I have already indicated, some of the key concepts which make up the core of this perspective are explicitly thought to be Islamic and thus serve further to legitimate it. Despite the incorporation of some religious symbols into the common-sense perspective, religious beliefs can by no means be seen as just a symbolic expression of the social order. But the two perspectives are interdependent. It is doubtful whether a religious understanding of the world could exist in a given society if it were totally alien to the prevailing everyday orientation toward social reality. As Clifford Geertz has written, "religious symbols formulate a basic congruence between a particular style of life and a specific (if, most often, implicit) metaphysic, and in so doing sustain each with the borrowed authority of the other" (1966:4). Thus at least part of the religious perspective moves beyond the realities of everyday life.

It is important, I think, to recognize degrees of separation of the religious and common-sense perspectives, a point that is further discussed in the next chapter. I suggest that implicit ideologies show a much greater congruence with the everyday perspective than those which are consciously articulated. In a civilization-wide religion, such as Islam, many permutations of explicit and implicit ideologies are copresent and affect each other. Maraboutism, of course, is essentially an implicit ideology. Nineteenth- and early twentiethcentury sources almost unanimously attest to the significance of marabouts. Lacking the concept of world view or other devices to explore implicit ideological patterns, ethnographers of this period were unable to account for why marabouts were so highly regarded in any but such broad formulae as Bel's assertion of the "traditional" reverence for "human fetishes." Contemporary maraboutism is a pale reflection of an ideology which once was given a much fuller expression and which was a template for a much more significant range of activities than is presently the case. Still, it gives an idea of the earlier ideological bases of marabouts.

My intention in the following chapters is not simply to detail the partial congruence between maraboutism and everyday assumptions about the social world. Studies documenting such a relationship have been an ethnographic staple for several decades, even if not for the Muslim world. It is important to see just how this seeming convergence is accomplished, but it is even more significant to examine where it fails.

** 6. The Ideology of Maraboutism

Max Weber began his study on the sociology of religion by proposing to examine “the conditions and effects of a particular type of social action” (1968:399); he explicitly avoided a definition of religion for two reasons. In the first place, he saw no analytical utility in formulating a definition so broad as to encompass the wide diversity of behavior labeled as religious by actors in various societies. Second, he did not want to assume a priori that the religious was in all cases set apart from everyday purposive conduct or that behavior could be meaningfully classified into such analytic categories as religion and magic on the basis of our own notions of causality.

As suggested earlier, whatever else religion might entail, it is a set of beliefs, more often implicit than explicit, that are understood by members of a society against the background of tacit, shared assumptions about the nature and conduct of everyday life. Religious ideologies may not be entirely derivative from these common-sense assumptions, especially in the case of such “universal” religions as Islam and Christianity, but they are necessarily understood in their context.

Weber’s caution about defining religion is rarely reflected in later, protracted debates among anthropologists and sociologists over whether religion should be defined in terms of the nature of beliefs as labeled (e.g., Durkheim’s distinction between “sacred” and “profane”) or their content (e.g., Tylor’s “spiritual beings”). As the neo- Weberian W. G. Runciman has recently argued, neither of these basic approaches (or subsequent refinements of them) has been entirely satisfactory (1970:59–62). His own contribution to the debate has been to reiterate Weber’s implicit point of over half a century earlier that any attempt to distinguish “religious” from other forms of belief presumes that it is already known “what exactly people do believe” (Runciman 1970:61). Only once beliefs have been identified in the categories of the actors themselves is it possible to ask which are religious. He argues that sociologists and anthropologists generally use the term religion

in the sense where “ideology” would do almost as well— that is, in denoting those distinctive combinations of factual with ethical beliefs which constitute the “religion” of the Nuer, Dinka, Tokugawa Japanese, Homeric Greeks, Roman Catholics ... and all the rest. In other words, if there is a general distinction to be retained between “nonreligious” and “religious” beliefs, it is merely a distinction between what may be loosely called “matter-of-fact” beliefs on one side and beliefs about the conduct of life on the other. The latter may stand in many different sorts of relation to the matter-of-fact beliefs about the cosmos which the people in question also hold. But they are a universal and unambiguous category —all cultures have some [such] beliefs. (Runciman 1970:75–76)

Much recent work on the concept of religion tacitly adopts a similar position. The “definition” of religion offered by Clifford Geertz in “Religion as a Cultural System” (1966:4) is to him less a definition than a five-point paradigm for the exploration of the systems of meanings embodied in certain types of symbols. The paradigm recognizes the futility of rigorously setting apart a religious component from other systems of meaning in all societies.

To be sure, in some contexts the term religion can be employed clearly and unambiguously, as where it delineates nothing more than declared membership in a formally organized religion (e.g., Lenski 1963). But such uses clearly take for granted the

more interesting issues of definition. Most uses of the term religion are much more complex. For example, Wilfred Cantwell Smith's The Meaning and End of Religion subtly interrelates religion with sociohistorical context in documenting the historical trend toward reification of the concept of religion in both the Christian and the Islamic traditions. He sees increasing use of the term in both traditions as symptomatic of an increasing fragmentation of man's social and personal life, so that the religious, instead of being central to a coherent, generally implicit, vision of the world, emerges as merely one facet of a person's life alongside many others (1963:124). Clearly what is considered religious in these traditions cannot be encapsulated in a definition devoid of social or temporal context.

The identification of the "properly religious" is facilitated when one of its elements is an articulated, bounded ideology, as opposed to a merely implicit system of belief. However, the presence of such ideologies in the "universal" religions, such as Islam, does not automatically indicate the roles they play in the local contexts in which they are received and understood. Of course, within these major traditions there are a wide range of explicitness of belief and significant variations in patterns of belief (cf. Weber 1968:388–401). Thus the reformist and modernist movements in North Africa, of which more will be said later, possess fairly coherent doctrines based on clearly stated, universalistic grounds. Despite the significance of these movements over the last half century in North Africa, their ideologies are far from being popularly accepted, especially in Morocco. In general, their largest impact has been among an educated urban minority. The traditional maraboutic belief system, on the other hand, is almost entirely particularistic and, as I shall indicate, ordinarily an unquestioned, taken-for-granted part of the social order. Reformist doctrines are radical in the sense that they seek to alter established patterns of belief (cf. Harris 1971:208–214). They call into question the taken-for-granted assumptions about the cosmos and the social order and thus must necessarily be explicit. To a limited extent their adoption by many of the urban bourgeoisie has compelled an explicit, but generally ineffective, articulation of maraboutism. Nonetheless, one of the strengths of maraboutism is that even at the present it does not have to be consciously articulated or explicitly defended in order to be maintained by the vast majority of Morocco's rural population. While aware of the disrepute into which maraboutism has fallen in the eyes of most of the urban bourgeoisie, the rural majority and some townsmen continue to act as if they accept its fundamental tenets.

*** The Clients' View

How do the clients conceive of marabouts? The assumptions implicit in maraboutism are not systematically articulated by them. Nor, for that matter, are they by the Sherqawa, whose identification with maraboutism is discussed in the next chapter. Ties with marabouts and what they indicate of the social and political alignments of those who hold them are so integral a part of their world that no explanation of them is considered necessary. But the assumptions behind these ties can be discerned in how persons act and in how they describe their relations with marabouts. The meanings implicit in statements and ritual acts are systematically patterned into a social logic, even if it is only fleetingly perceived, if at all, by their carriers. As in any social group, some people are naive or even cynical about its ideology, although most manage to take it for granted (cf. Bendix 1963:341–343). Skepticism is generally confined to the assessment of individual marabouts, not to the underlying conception of how the supernatural intervenes in the affairs of this world.

The key to understanding the ideology implicit in maraboutism is in the cultural conception

of bar aka as a form of causality and the means by which it can be appropriated to sustain one's own activities. Baraka in Morocco and, for that matter, throughout the Muslim world is considered "a mysterious wonder-working force which is looked upon as a blessing from God" (Westermarck 1926:1,35). How this is elaborated depends upon social context, but in Morocco baraka is often invoked as an explanation for uncanny events, extraordinary political sagacity, and a range of mundane situations indicating well-being, abundance, or merely sufficiency of any quality or material. Westermarck's extensive, if itemistic, listing of instances of baraka half a century ago still largely holds for rural Morocco (1926:1,35–251). It is associated with a multitude of gestures and acts in daily life, words, places, animals, plants, foods, writing, descent from the Prophet or from Sidi 'Umar, times of the year, events in personal life cycles, and, of course, marabouts. Thus, for most Moroccans, baraka is as much a part of the everyday world as is witchcraft among the Azande. It is a concrete manifestation of God's will and is invoked as an explanation of why some things happen while others do not. Marabouts are conceived by their clients as having the ability to transmit this baraka and thus are concrete symbols within the social system of the pervasiveness of the supernatural in mundane affairs.

One way of understanding the significance of such a concept is in relation to the dominant patterns of the social structure, as Mary Douglas has suggested (1966:107, 111). The fact that Sherqawi marabouts and certain other powerful maraboutic descent groups have maintained a pre-eminence throughout four centuries of major political realignments indicates that baraka does not operate in a freely competitive system in Morocco, although marabouts and their descendants frequently represent the concept in this way. Maraboutic ideology as held by marabouts and their descendants, to be discussed in the following chapter, differs significantly in emphasis from that of their clients. Both ideological variants are influenced by a second factor that Douglas fails to consider, or assumes not to exist, in order to highlight her argument on the relation of ideology to social structure. This is the influence of competing patterns of belief. Perhaps in "simpler" societies one can assume that ordinarily such a factor need not be taken into account. At least many social anthropological monographs, including those written after decades of colonial domination of the society under study, make such a presumption. But Morocco, even preprotectorate Morocco, including the tribes of the Middle and High Atlas mountains, is no more a "simple" society than were the tribes of ancient Palestine, whose ideological fermentation has been so ably described by William Robertson Smith (1919). Both marabouts and their clients are, and have been in the past, aware of nonmara- boutic conceptions of Islam, and this awareness has had an impact on their own ideological tenets and ritual behavior. I shall discuss the consequences of this awareness later at greater length but think it important to emphasize for the present discussion as well.

Moroccans place maraboutism in the following context. Some townsmen explain that all Muslims believe in the existence of saints (wali-s), since the Qur'an specifically mentions them. A ivali, in classical Arabic, is simply an individual who is close to God. Strictly speaking, as educated Muslims do, only God knows who is a saint, just as only he knows those who are sincerely devoted to him, "the pious ones" (salihin^ sg., saleh). In ordinary usage both wali and saleh refer to anyone popularly considered to have "a certain rank with God" (sh-daraja I- end Allah). This conception implies, of course, a hierarchy among Muslims before God, a notion emphatically denied by reformist Muslims and even by many clients of marabouts, but still at the base of popular Sufism.

The concept of marabout (jnrabet) overlaps with that of saint. Essentially a marabout is "one who is tied to God." The word comes from a root meaning

“to bind, to tie, to fasten,” as one would a camel to a stake. What clients of marabouts and many other Moroccans assume, and what is not textually justified by the Qur’an as now interpreted by most educated, urban Muslims, is that marabouts are endowed with a special relation toward God which makes them particularly well placed to serve as intermediaries to him. Marabouts are regarded as “close” (qrib) to God. The meaning of “closeness” here is modeled upon, and to some extent constitutes a pattern for, relations among men.

Those who believe in marabouts further assume that marabouts can be “tied” to men. The creation and maintenance of such ties are regarded as essential or, in some contemporary contexts, simply advantageous, because nothing ever just happens. All events are the result of the active intervention of God’s will, even if by maraboutic proxy. The problem for individual believers is how to ensure the flow of grace to sustain their particular concerns. This ideology is concretely symbolized in many ways. One is for client tribesmen to bring some of their seeds for fall planting to Sherqawi marabouts or their descendants, asking for an invocation (da[i]wa’) to be said over them. These are later mixed with other seeds. When asked for an explanation of their action, tribesmen reply that “grain does not grow by itself.” In the past, when Sherqawa are said to have provided all the seeds necessary for planting, the representation of this underlying belief was considerably more explicit. Baraka in such contexts is often referred to as a physical substance (e.g., “a little bread” \sh-khbiza)) which can be gleaned by physical contact with a marabout or his shrine, and even taken away from clients again if they reveal their acquisition of bar aka to others. This is one of the reasons why tribesmen are often reluctant to speak openly of their dealings with marabouts and their descendants. Knowledge of these ties by hostile third parties (including other marabouts) can threaten their efficacy.

Thus the core of belief in maraboutism is quite simple. It postulates that relations between men and the supernatural operate in nearly the same way as do relations between men only.[78] For those who believe in marabouts, the dyadic, personally contracted bonds of inferiority and superiority which are thought to structure the Moroccan social order hold equally for relations toward the supernatural. The major difference is that the supernatural is thought to be consistently stronger than men and much more difficult to predict. All such ties are maintained by ongoing exchanges of obligations (haqq-s). In so far as possible, men contract and maintain ties with those persons they consider capable of sustaining or enhancing their interests and reassess these ties as economic and political circumstances shift. Depite the formal ideological claim that only God knows those who are “close” to him, clients of marabouts seek this-worldly signs which indicate who such persons might be.

As I stated in the introduction, this conception of man’s relation to the supernatural is incongruent with the formalist notion of Islam without any intermediaries, but the two are not mutually exclusive. The opposition of these conceptions is logical, not sociological. Those Muslims who tacitly accept the concept of maraboutism, or who act as though they do, also claim to accept the tenets of formal Islam, which are generally known to them at least in broad outline. They often say the daily prayers, attend Friday mosques, fast, and accept in principle all formal obligations incumbent upon Muslims. However, they implicitly act as though these formal tenets of Islam, the way relations with God are supposed to work, are peripheral to a “way of thinking and feeling about reality in general” (Bellah 1970: 146) which is directly linked to their immediate social world. At least for some Moroccans, the reality of belief in marabouts is confirmed by the nature of the social world, “the way things are,” even if other Moroccans regard the extension of the patterns of conduct that pervade the social order to encompass the supernatural as erroneous.

The coexistence of the ideology of maraboutism with variations of formal, explicit Islam is clear from the following statement, in which a townsman contrasted what “everyone else” believed and what he claimed was his own position, which he claimed was identical to that of the lectures on Islam broadcast on the radio (radyo shra‘):

Of course the radio says that everything comes directly from God. But just as the king has his ministers, God has his [marabouts]. If you need a paper from the government office, which is better? Do you go straight to the official and ask for it? You might wait a long time and never receive it. Or do you go to someone who knows you and also knows the official? Of course, you go to the friend, who presents the case to the official. Same thing with baraka. If you want something from God, you go to [the marabout]. He is just like us. The only difference is that he works with God [khdem m’a Allah] and has a high rank [daraja kbira] with him. If the marabout is too great [to directly approach], you go to his children. (A barber)

Although marabouts are thought to have a “high rank” with God, their clients are not assured that their requests will be granted. A woman who serves as custodian at one of the shrines in Boujad explained why: “The marabout is close _qrib] to God, but only has his turn to make his requests [itlob l-haq[[../../../_qrib~][q]. Have]] you seen how we stand in line in front of the butcher’s and the hospital and take turns? Even the marabout is like that with God.” The principal concern of clients of marabouts is not the implicit criticism of maraboutism by those opposed to it, but the ability to secure ties with the most capable marabouts disposed to act on their behalf.

The abilities attributed to marabouts vary greatly. Only a few, such as the principal Sherqawi marabouts, have an extensive clientele and a reputation for efficacy over a wide range of activities. These have a regular clientele of tribal groups and attract individual pilgrims from most of the regions of Morocco. In contrast, a much larger number of marabouts have developed a reputation for specified ranges of action, such as the ability to cure throat ailments (Sidi Shegdal of Bni ‘Amir) or skin diseases and syphilis (Sid et-Tunsi of Shawya). The clientele of such specialist marabouts tends to consist entirely of individual pilgrims seeking cures for these specific maladies. Finally, there are the minor marabouts connected with specific dawwar-s, mentioned in Chapter 4. These may not be regarded as particularly efficacious in any field. On occasion their aid will be sought, without much hope of success. For that matter, tribesmen do not offer them much to show faith in them. Some of these enshrined country marabouts are even approached, as are some of the less reputable country fqih-s, with requests for magic—to further an amorous adventure or bring disaster upon a personal enemy. Most persons dread approaching major marabouts or intercessors to them with such requests.

The reputations of these marginal marabouts often are quickly forgotten. In contrast, prominent marabouts like those of the Sherqawa are legitimated by attributes which in principle reflect the permanency and continuity of baraka and the ability to communicate it. These include the claim to mystical insight, transmitted along an unbroken chain (silsila) of powerful marabouts ultimately linked to the Prophet Muhammed, and patrilineal descent from the Prophet Muhammed or his second caliph, ‘Umar ben 1-Khattab (d. 644). The Sherqawa, collectively known as the “children of the shaykh” (wlad esh-shaykh) are thought to possess these enduring characteristics. Those Sherqawa who effectively control the resources of the

zawya are considered to be marabouts, particularly as this is symbolized by their apparent wealth, their ability to secure the support of other Sherqawa, and the size, strength, and faith (niya) of their client groups as measured by offerings and sacrifices. Only two living Sherqawa presently enjoy such a reputation. The power of enshrined marabouts is manifested in a similar fashion—the lavishness of their shrines, the respect accorded them by living Sherqawa, and the strength and intensity of their clientele. Such enshrined marabouts are almost exclusively those who in the past were lords of the zawya or sons of the founding marabout.

Not all of the internal differentiation among the Sherqawa is lost on their clients, but there is a tendency to impute to all of the descendants of Sidi Mhammed Sherqi the attributes of the best known. Thus the Sherqawa are collectively considered to be better off and more prosperous than the non-Sherqawa of Boujad. The implicit assumption is that the shaykh's descendants prosper because of their "closeness" to their maraboutic ancestor. Many of the Sherqawa had the advantage of education in the colonial past, when access to it was much more restricted than is presently the case. They also held until recently all significant local administrative posts and continue to hold several. Regionally and nationally prominent Sherqawa also are seen from the viewpoint of clients of marabouts as deriving power and social honor from the baraka of their maraboutic ancestors.

*** Marabouts and Clients: The Symbolism of "Closeness"

The reputation and prestige of a marabout are only part of the concern of his clients. As with other social ties, those sustained over a period of time and in multiple diffuse ways are considered to be the most efficacious. Thus, most of the tribal groups of the Tadla Plain and neighboring regions claim covenants (^ahd-s; bay'a-s) with the Sherqawa which were sealed in "early times" (bekri). Bekri is that range of time which forms a backdrop to the ordinary social horizon. The ordinary social horizon is composed of those events impinging upon the lives of tribesmen which can be placed in their full social context. Events which happened in "early times" are also thought to have a significant effect upon the present, but their context is not fully known or is thought to differ from that of the present. Myths are thought to portray "early" events. As in myths elsewhere, some of the events and transformations portrayed in them do not occur in other contexts; the myths also refer dramatically to origins and transformations (Cohen 1969:337). In so far as they affect the present, the covenants portrayed in myths are regarded as "true" events and constitute a part of the universe taken for granted by tribesmen of the Tadla. Such covenants, maintained and regularly renewed, are considered to be the strongest tie that can exist between marabouts and their clientele. Even individual pilgrims often try to claim "closeness" with the Sherqawa through membership in one of the many groups mentioned in the myths current on the Tadla and elsewhere in Morocco.

Such myths serve as "charters" through which individuals and groups of individuals legitimate their ties with the Sherqawa. This Malinowskian facet of maraboutic myths does not exhaust their rich and complex symbolism, but it is the only aspect of the myths that imposes itself upon the consciousness of the clients of marabouts and thus is an aspect closely related to the social context of maraboutism.[79] Because orientalists and ethnographers have long presumed that such myths do not exist in the Muslim world, at least outside the corpus of formal Islamic rituals, they have been almost entirely neglected by scholars interested in the Muslim world. As an example, I present one of them below. It is a short "origin" myth, depicting how Sidi Mhammed Sherqi came to Boujad and called upon the tribes to settle in the region.[80] Like most of the others, this myth is known to all

tribesmen of the region and most townsmen. This particular version is taken from a caretaker at one of the Sherqawi shrines. Such Sherqawa know the most elaborate versions of such myths and recite them regularly to pilgrims.

Why did Sidi Mhammed Sherqi settle there? It was because of that boy, Sid 1-Hajj 1-Meknasi.[81] He used to go on pilgrimages to Mecca. He made seven pilgrimages and on the seventh he died atop Mount ʻArafa.[82] That camel which carried him living [to Mecca], by Sidi Mhammed Sherqi's covenant with it, returned him dead.

When the camel returned his son dead, Shaykh Sidi Mhammed Sherqi went into his wife's room and said to her, "O Khelfiya!" She replied, "Yes?" He asked her, "Wasn't there something of value given to us? Today shall we give it back or not?"[83] She answered, "By God, Sidi Mhammed Sherqi, we'll return it in the same condition it was given to us." He said to her, "Whoever is like me can find strength in destiny. Death is hot, acrid. She gave me a cup of bitterness. Go on, 0 Hajj 1-Meknasi, 0 my son, we meet in the next world."[84]

His wife didn't restrain herself, fell to the ground, and rolled in convulsions in front of Shaykh Sidi Mhammed Sherqi. He asked her, "Why don't you forbear over [the loss of Sid 1-Hajj 1-Meknasi],[85] who belongs to God? Look at what we have done because of that loss. What will happen when the next comes?[86] Go on!" Khelfiya will never again bear one who gave her joy like Sid 1-Hajj 1-Meknasi.[87]

When Shaykh Sidi Mhammed Sherqi's wife did not contain her grief at that place where they were [living], he said to her, "I'm not going to stay in this land which disturbs my praising of God. I'm going to settle in that place which is free [of the thought] of Sid 1-Hajj 1-Meknasi." Shaykh Sidi Mhammed Sherqi went down there, lived in that land, and began looking for water. He came to ʻAyn Shaykh.[88] He struck his walking stick against the spring, water gushed forth by the will of God, and he said, "There will be a settlement here."

When Shaykh Sidi Mhammed Sherqi settled, he needed people to fill the land with him. He called for seven from Bni Zemmur, seven from Bni Shegdal, and seven from Smaʻla. He said to them, "Who wants to sacrifice?" He picked up the knife, went into trance, and the knife dripped with blood. He said to the tribesmen, "Who wants to sacrifice?" They replied, "We will sacrifice." The marabout said, "Come! I'll take your sacrifices in turn: [first] a SenTli, [then] a Shegdali."[89] When he went out,[90] he called, "Bring your necks for the sacrifice." The SenTli came forward, but the Shegdali fell back, until all seven [of the Smaʻla] had sacrificed. [When the marabout came out of trance] he asked, "Who entered and who remained [outside]?" Someone replied, "0 Sidi, the Smaʻla went in and the Bni Shegdal remained outside." [Then] the marabout said, "The Smaʻla will be watered[91] [with bar aka], but Bni Shegdal will remain without."

The ʻUmariya[92] whom Shaykh Sidi Mhammed Sherqi had married said to him, "Here is my neck, O Sidi Mhammed Sherqi, on behalf of Bni Shegdal."[93] Then Shaykh Sidi Mhammed Sherqi said to the Bni Shegdal, "Since the woman offered her neck on your behalf, you are now milk brothers of the Smaʻla." She gave her two breasts: that for the Smaʻla overflowed with milk; that for the Bni Shegdal overflowed with water. The marabout said to them, "Go, O Smaʻla! Whatever I break, you can mend; but that which you break, no one can mend."

Those are the people who filled the land with Shaykh Sidi Mhammed Sherqi and who remain in it to this day.

This myth forms part of a cluster of some sixty that I have collected on the Tadla Plain concerning the Sherqawa and other marabouts. I use the term cluster, rather than cycle, to describe these myths collectively because, like the social groups from which they emanate, they do not form closed, bounded entities. Those collected in Boujad and its region link Sidi Mhammed Sherqi and his sons (but not later descendants, about whom there are only miracle stories, karama-s, not myths) with client groups and marabouts throughout Morocco. Conversely, myths from the shrines of other marabouts on the Tadla Plain and adjacent regions articulate with the maraboutic myths of the Sherqawa. For instance, a myth of the Hmadsha religious order near Meknes has their founder, Sidi ʻAli ben Hamdush, receiving his baraka from Sidi Mhammed Sherqi (Crapanzano 1973:30–56).[94] The Sherqawa are not aware of this myth, although they believe that Sidi ʻAli obtained his baraka from Sid 1-Hafyan, possibly a grandson of Sidi Mhammed Sherqi, whose shrine is in Boujad and is visited regularly by Hmadsha pilgrims. Later Sherqawi marabouts are also said to have had complex ties with their contemporaries (some of whom are known from written historical sources) or those currently thought to have been their contemporaries. Were such interconnections fully traced out, I think they could be shown to link all the major marabouts of Morocco and North Africa (cf. Gellner 1969: 275–278; Depont and Coppolani 1897; Rinn 1884). The clients of the Sherqawa, in any case, see themselves as tied through their marabouts to the wider society of Islam.

Tribesmen and Sherqawa are aware that at one level these myths concern the nature of obligations in social groups and between such groups and marabouts. Because of their concrete, compact imagery and particularistic references, the symbolism of these myths can be comprehended only with difficulty by those unfamiliar with the social milieu in which they are known. Several implications of the myth presented above are obvious. In the first place, the marabout, Sidi Mhammed Sherqi, makes the land fertile so that its settlement becomes possible. This sequence of events presumes bar aka, as described earlier, as a causal power transmitted through specifically contracted social ties. The second crucial aspect of the myth is its presentation of the contrasting forms of relation possible with the marabout, including the logical possibility of no relation (the Bni Zemmur) .[95] Links are established in the myth both by sacrifice of the seven animals and the offer, not the consummation, of a woman for sacrifice as the substitute for an animal.[96] Her offering in the myth explicitly establishes (for Bni Shegdal) a kinship relation with the marabout and with other social groups that are in a client relationship to him. These possibilities are depicted in the myth by combinations of ties of milk, blood, and water. Tribesmen do not comment upon these possibilities except to say, in response to the ethnographer’s queries, that some of the combinations—ties of blood and milk, milk alone, blood alone, and those not secured by either blood or milk (those of water?)—are replicated in actual social relations. Both the Sherqawa and their clients claim that the covenant represented in the myth fixes mutual obligations between them. These are depicted by the symbolism of sacrifices and marriages, which create irrevocable ties of blood and revocable ones of “closeness” between the parties.

Other myths known to the Sherqawa and all tribesmen of the region explore the same theme. In one, Sidi Mhammed Sherqi takes a woman from the Bni ʻAmir and has a son by her, Sid 1-Ghazwani. This marriage places the Bni ʻAmir in the relation of maternal uncles (khal-s) to Sid 1-Ghazwani and, by common metaphorical usage of the term, to all the Sherqawa. Later, when the Bni ʻAmir are oppressed by a ruthless sultan, Sidi

Mhammed Sherqi sends Sid 1-Ghazwani to their aid (see Eickelman and Draioui 1973). Among other themes, the myth stresses the obligation of the Sherqawa to aid the Bni ʻAmir because of their khal relationship. In another myth, concerning the Bni Wra (Shawya), Ghazwani changes the tribe from the form of birds into humans and makes them Muslim at the same time. A malevolent sultan had earlier cursed the tribe and changed them into birds. From the time of their retransformation, they regularly maintained their covenant with the Sherqawa.

Although tribesmen themselves suggest the partial replication of certain relations portrayed in the myths with actual social relations, it would be an error to assume a priori the role these texts play in tribesmen's conceptions of themselves and of their relation with marabouts. Although in part these myths are consciously construed by tribesmen to be a sort of Malinowskian social charter, they are not correlated in a one-to-one way with assumptions about social conduct in the everyday world any more than the ideological use of the concept of agnation among tribesmen directly reflects the sociological principles underlying actual conduct. These myths provide symbolic statements of the role of marabouts in tying men to given regions and to each other. Marabouts make possible order within society and thus metaphorically constitute concrete, localized manifestations of Islam, submission to God's will.

In regard to the distinction between maraboutism as a cultural idiom and as a pattern for actual social relations, it is crucial to note that the "level" at which the covenant is concluded in the myths, that of tribes, is not matched by ritual activities of those units acting as groups. Collective ties with the Sherqawa are maintained and reaffirmed at the "level" of tribal sections and local communities. Moreover, many collectivities have covenants with the Sherqawa which are not represented in myths, and tribes linked to the marabout may be in hostile relation with one another. Thus there is considerable leeway in how such covenants are realized. Contrary to the suggestion of some tribesmen that such covenants have "always" existed, they actually fall somewhere between Sir Henry Maine's categories of "status" and "contract." Tribesmen often refer to their relations with the Sherqawa as ascribed, but both the myths and relations in the actual social world indicate achieved, contractual relations on the part of the persons and groups involved.

*** Remaining Connected

Sherqawa and client tribesmen claim that the original covenants between Sidi Mhammed Sherqi and their ancestors have been renewed in an unbroken parallel chain of descendants on both sides which has kept them "connected" (jnettasliri). These links are maintained in three ways. One is through offerings to and communal meals with those living descendants of Sidi Mhammed Sherqi who claim special relationships with certain tribes, tribal sections, or local communities. These descendants are called "visitors" (zewwar-s) , because they visit the tribesmen at intervals throughout the year to collect the zyara, which in this context means the offering made to a marabout or his descendants. Another way is by annual sacrifices at the shrines of Sidi Mhammed Sherqi and certain of his descendants, in the presence of living Sherqawa. A few groups, such as the Sma'la until recently, maintain their links in both these ways. A much larger number of groups regularly maintain their covenant only through offerings and communal meals with nonmaraboutic Sherqawa, omitting the annual sacrifice at the main shrine. A third way to remain "connected" is through offerings and communal meals with living marabouts, but this practice is rapidly disappearing. It is presently much more difficult for living marabouts to maintain their reputations than for those who are enshrined. Only one of the two Sherqawa currently considered to be living

marabouts actively fosters this belief by entertaining pilgrims and accepting offerings from them individually and collectively. Links through Sherqawi “visitors” are consequently much more common. The majority of such visitors belong to the two Sherqawi descent groups that have dominated the affairs of the religious lodge over the last century, the ‘Arbawi and Zawya groups. Others are scattered throughout the remaining descent groups.

The relation of Sherqawi visitors to their clients is generally diffuse. Often, visitors are among the very few townsmen with whom tribesmen have regular contact. When they come to the weekly market, they often seek out their visitors to give them small offerings and to ask for personal invocations on their behalf. Clients also call upon other forms of expertise from their Sherqawi visitors, whose occupations include those of carpenter, tailor, shopkeeper, caravanserai operator, and notary. Beyond such particular skills, visitors can relay requests to other Sherqawa or townsmen. Even if such intervention is not efficacious, it is in the interest of visitors to allow their clients to think it is in order to enhance their own prestige. Each visitor is spoken of as “working” the local communities with which he is particularly regarded as an intermediary.[97] Most work five or six local communities, not necessarily in the same tribal sections. This “work” is generally passed from father to son or other close relations among the Sherqawa, including women on occasion. With the rapid spread of urban-based, formal Islam and diminished revenues and prestige from “visiting,” many younger Sherqawa decline to carry on the activity. Even tribesmen now consider many visitors to be beggars, emphasizing their need to use donations for their own subsistence, although still respecting their maraboutic descent.

Consequently these ties are rapidly being eroded, although there are still a large number of middle-aged visitors who derive enough income to want to continue the practice despite unfavorable comments from other townsmen. Moreover, the extent of attrition is difficult to determine because many Sherqawa and tribesmen prefer, for reasons previously mentioned, to dissimulate their links.

The major collective contacts between the Sherqawa active in the affairs of the lodge and their tribal clients occur on three annual occasions. On two of these, Sherqawi visitors go out to the local communities tied to them. The first visit is in early spring, generally in March, when pastoral contracts expire and the profits of the preceding year are traditionally divided. Some Sherqawa even buy horses for these rounds, which they then sell after the June harvests. Visitors again “work” their local communities immediately after the harvests in late May and early June. On both occasions, Sherqawa extract offerings in exchange for invocations to their ancestor to provide baraka for the supplicant group. This quid pro quo is often punctuated by heated, acrimonious protests. Although the tribesmen feel they need the invocations of the visitors for their well-being, many regard their demands as extortionate and openly say so. Arrangements for the collection of offerings on these occasions are usually made not by the visitor himself—only the poorest and least effective are reduced to that extreme—but by an “associate” (saheb) in each local community. This associate serves as the channel through which demands are made upon the group involved by the Sherqawi visitor and requests are made to him in turn. Generally such tribal associates are men of influence in their local community. Most are moderately wealthy, and many, in the hierarchy of oligarchy enhanced by the protectorate, served as government shaykh-s. In independent Morocco these same persons also generally play a prominent role in all representations of the tribal group with the outside world.

Living marabouts commonly made visits to their clientele until the 1930’s. They ceased this practice as the size of offerings diminished. It became clear to marabouts that they were

exposed on such occasions to open opposition from an emerging group of reformist Muslims and from tribesmen themselves. In such circumstances the marabout, not having full control over the conditions of his public exposure, risked substantial losses of prestige and hence of his reputation for bar aka. Baraka may have, as Mary Douglas claims, a “snowball” bias toward success (1966:109), but it can also work just as quickly in reverse.

The importance of the intermediary role of the Sherqawi visitors with their maraboutic ancestors and the wider Muslim community is still stressed by tribesmen, although the status of such visitors is often played down. The offerings which most visitors collect are now used for their personal benefit, although they are still known by the names of zakat and ‘ashur. The zakat is the tax incumbent upon all Muslims able to pay it and used for the benefit of the Muslim community. In the preprotectorate era, when most visitors seem to have served as messengers for and intermediaries toward their maraboutic kinsmen, there are indications that some of the revenues really were used in such a fashion, particularly in years of drought. ‘Ashur means “tithe,” but is not to be taken literally. It is a descriptive term which traditionally has signified taxes paid to the Makhzen or any other regular levy. Tribesmen designate offerings to marabouts or visitors as the “share of the shaykh” (l-haqq dyal esh-shaykh). Upon making them, tribesmen say to the visitor that they are given “in the face of God” and “for the sake of your ancestor” (7# khater jeddek). In the past, visitors were the key to seeking the intervention of the Sherqawa in a wide range of matters, including the mundane. Their role at the present is greatly attenuated in this respect, although, as recently as an election in the early 1960’s, a local candidate successfully consolidated his tribal support by persuading Sherqawa zewwar-s to work on his behalf.

The principal occasion for contact between the Sherqawa and their tribal clientele occurs during the fall festival (jnusern) of Sidi Mhammed Sherqi. Most groups renew their covenant with the Sherqawa during this period. As has been discussed, the timing of the festival varies with the specific ecological conditions of each client group. The predominantly transhumant Sma‘la, for instance, prefer coming during a full moon in order to diminish the possibility of theft of the animals which they leave behind. Another factor which influences the pilgrimage of specific groups is the desire of Sherqawi visitors to avoid the copresence in Boujad of mutually antagonistic groups. Each group informs their visitor when they want to make the pilgrimage. The visitors of principal groups then informally consult among themselves and set dates. This activity is virtually the only one in which visitors coordinate their activities.

The festival lasts an entire month but “peaks” in the ten-day period during which tribal sections from the Sma‘la are in Boujad. These and a few sections of the Bni Zemmur are the last to come on horseback and set up tents for the duration of their visit. The Sma‘la tents form a crescent along Boujad’s eastern side. Throughout the period of the Smada presence, “powder plays” (tehrak-s) occur daily between horsemen of rival local communities and tribal sections. As stated in Chapter 4, the patterns of participation in these, the arrangement of tents, and the patterns of contributions for collective offerings to Sherqawi marabouts and visitors all reflect the effective social units at that time. For groups that arrive by truck or bus, only the pattern of offerings to the Sherqawa indicates social alignments. Alignments of these groups are considerably more blurred than is the case with groups that arrive on horseback and muleback, because the occasions on which they are called upon to express group identity are fewer. Without horses, they cannot compete in “powder plays.” Their stay in Boujad tends to be shorter; and their lodgings are scattered throughout the town. Under these conditions open breaks with other groups or

within groups are less likely to be expressed. In fact, such groups often make joint contributions to the Sherqawa for reasons of economy and thus have even greater reason to attenuate any differences that exist among themselves.

Explicitly economic activities do not presently form a significant part of the festival, although they did in the past. The urban bourgeoisie, lacking substantial economic benefit from the festival, has become consequently more open in condemnation of it. Today, pilgrims buy in Boujad only those few supplies needed for their actual stay. Nevertheless, the government has in recent years associated an agricultural and livestock exposition to the festival in order to disseminate modern techniques to tribesmen. After a lapse of at least a decade, local government officials are also trying to use the festival to have tribesmen reaffirm their loyalty to the Makhzen. Such activity is hardly novel. Prior to the protectorate, sultans used a number of means to indicate their approval or disapproval of particular marabouts. Similarly, the French occasionally banned musem-s or restricted attendance in order to exert pressure upon particular tribal groups. The independent Moroccan government has also employed similar tactics in recent years.

The annual pilgrimage to Boujad is generally the one occasion which partially removes tribesmen from their ordinary cycle of agricultural and herding activities and weekly markets. Ritual activities accompanying the formal Islamic feasts and life-cycle occasions, such as births, circumcisions, weddings, and funerals, accomplish this to some extent but still are held in the social context of totally familiar social life. In contrast, the pilgrimage to Boujad is partially removed from these circumstances. Some contrasts with the pilgrimage to Mecca (hajj) help to discern what is characteristic about the pilgrimage (zyara) to the Sherqawi shrine in Boujad.[98] The pilgrimage to Mecca is obligatory for those Muslims economically and physically able to undertake it but is an act performed by individuals. The pilgrimage to Mecca and its associated rituals remove most Muslims to the periphery of the web of normative, local social structure. In Mecca itself, pilgrims from different parts of the Muslim world tend to unite in a spirit of what Victor Turner has called communitas. An ethos of the equality of pilgrims toward one another permeates their activities.

Many of these features are largely absent from the pilgrimage to Boujad. There is no free commingling of pilgrims from different social groups, although, as in traditional markets, there is a suspension of overt hostilities. Each group present has a dyadic tie to the Sherqawa, but this bond does not necessarily create horizontal ties among the groups themselves. The timing of the hajj to Mecca is determined by the Muslim lunar calendar, while the zyara to Boujad is tied to the agricultural and herding cycle. As with the hajj, the decision to go to Boujad is made by individuals on an annual basis, although in the latter case there usually is considerable group pressure to participate. Finally, the inequalities implicit in everyday social relations are preserved during the festival in Boujad.

The central feature of the fall festival is the renewal of the covenant with Sidi Mhammed Sherqi. Its modalities vary considerably, for the renewal is not effected in the context of a formal, stylized liturgy.

All covenanting groups offer animals, generally sheep or bulls, which are either sacrificed or accepted by the Sherqawa in lieu of sacrifice and later sold on the open market. This latter practice is a rationalization of the covenant and an attempt by the Sherqawa to mitigate urban hostility, including that of many Sherqawa, to maraboutic activities. Some

tribesmen insist upon sacrifice, however, and for them there is a Sherqawi butcher at the main shrine who makes the sacrifice and then sells the meat to pilgrims at current market prices. The profits of this are then divided among the Sherqawa.

Collections for these sacrifices are made within each local community and tribal section by one of their number, generally the same person who acts as associate for the Sherqawi visitor. The share of contributing households is roughly scaled to their ability to pay. Considerable cajoling and public ridicule of recalcitrant donors often accompany these exactions up to moments before the sacrifice.

Most groups offer only sheep at the main shrine, but the tribal sections of the Sma‘la evince a considerably more intense relationship toward the Sherqawa. They offer sheep at each of the principal Sherqawi shrines in Boujad and, in addition, a bull at the main shrine of Sidi Mhammed Sherqi. Until 1968, the latter was offered in what is known as a ^argiba sacrifice. This is a means used by tribes and tribal sections to secure and reaffirm major covenants or to impose a major supernatural compulsion (“ar). In the preprotectorate and early protectorate periods the t’argiba was often used to secure amnesty (amari) after rebellion from the Makhzen. Later it was used in the same fashion with the French. It last was used on the Tadla Plain in this way by the Sma‘la in August 1955, to bring a halt to the aerial bombardment and reprisals of the Foreign Legion for the earlier tribal attack on Wad Zem that same month.[99]

The t’argiba sacrifice at the main shrine generally took the following pattern. The tribal sections of the Sma‘la gathered at their tents on the outskirts of Boujad. Their Sherqawi visitors there said an invocation over the bull. Several barefooted tribesmen then led the bull, running, through the streets of Boujad to the shrine of Sidi Mhammed Sherqi. Other tribesmen of the covenanting group accompanied the bull on horseback or barefoot, all shouting their allegiance to Sidi Mhammed Sherqi. Some members of the procession beat drums, others went into trance (jedba) , particularly as the group approached the shrine. Other pilgrims and a few townsmen often joined the procession as it ran through town. Most townsmen, however, stayed at a distance because the Sma‘la had a reputation for being unrestrained during this procession, particularly if they saw the color red.[100] Finally, the bull was sacrificed in the interior courtyard of the shrine, in front of the room containing the marabout’s sepulcher. As the throat of the sacrifice was hacked open, some of those in trance struggled forward to drink the victim’s blood as it gushed out. Others, who were not in trance, smeared blood over their clothes or collected it in small vials. These were made into amulets to wear around their own necks and to give to their women and children. Tribesmen in trance were then led to the wooden grill work (garbus) which surrounds the marabout’s sepulcher, where they remained until they returned to their normal state. Sma‘la say that when their faith (niya) was strong, those in trance saw water gush forth from under the marabout’s tomb, and they then drank it.

Those who fall into trance are an exception to my claim above that the pilgrimage to Boujad largely constitutes a continuation of the ordinary social order. Such individuals claim no memory of events while in trance and thus are withdrawn from ordinary conventions. The consumption of fresh blood, for instance, is formally interdicted (haram) in Islam. Tribesmen are aware of this. It must be emphasized, however, that such behavior has been confined to a few of the Sma‘la. No other tribal groups act in this manner, nor did they do so in the past. Although none of the participants offers any explanation of this ritual, its form suggests that the covenant with the marabout

is symbolized by blood sacrifice, which by its nature is an irrevocable act. The sacrifice is reciprocated by the marabout's endowing the land with fertility, symbolized by the water said to gush forth from under his tomb. The total lack of exegesis and of complementary rituals which form neat, closed patterns makes the interpretation of this ritual tentative. But perhaps its looseness of form is itself significant, since this looseness is replicated by the nature of groups in the social order.

The covenant of the Smada was last reaffirmed in the above manner in 1968. One reason for discontinuance of the ritual was pressure from townsmen, including many Sherqawa, who are hostile to this ritual and the view of Islam implicitly represented by it. Although even the governor of the province in which Boujad is located has attended the festival in recent years and made major donations to the shrine, his attendance is simply due to the importance of the festival in the eyes of the tribesmen. Another reason for the ritual's disap-

pearance is that the Sherqawa, in the distribution of the revenues of the shrines (see next chapter), prefer that the animals be converted into cash for distribution among themselves. Sherqawa persuaded the tribesmen that the offer of a sacrifice was the same as its performance, and this argument was accepted.[101] Thus the Sherqawa perhaps unwittingly spurred the rationalization of the covenant with their clients. Tribesmen still run with the bull to the main shrine, and some Sma'la continue to enter into trance as an expression, they say, of their intense devotion to the Sherqawi shaykh. The tendency for offerings in cash to replace offerings and sacrifices in nature has, I suggest, the unintended consequence for the Sherqawa of emphasizing the instrumental aspect of their relation with tribesmen. It also induces a heightened awareness in their clients as to just what they are getting in return. Offerings in cash are more directly comparable to marketplace transactions than the traditional offerings in kind.

Tribal groups other than the Sma'la (and for that matter the Sma'la at all Sherqawi shrines except the main one) are markedly nonecstatic in renewing their covenant with the Sherqawa. There usually is a procession from wherever the group is staying to the main shrine, but it is at walking speed, wearing shoes, unaccompanied by drumbeats, chants, or other ecstatic behavior. The sacrifice of the sheep, when it occurs, is regarded nonchalantly. Attention of tribesmen is not particularly focused upon the act; so it is difficult for outside observers to detect it taking place at all.

Although tribesmen maintain that covenants have been made on behalf of their respective groups ever since the Sherqawa first came to the upper Tadla Plain, they are conscious of the latitude of the form in which their offerings are made and of the shifting composition of the groups involved. For instance, in recent years the Hwazem tribal section of the Sma'la offered grains and sheep to their Sherqawi visitors, in addition to sheep at each of the principal Sherqawi shrines and a bull at that of Sidi Mhammed Sherqi. The Trosh and Wlad Fennan tribal sections made similar offerings to their visitors but none at the Sherqawi shrines in Boujad. After several years during which the harvest of the Hwazem was markedly superior to that of the other two tribal sections, tribesmen of the latter groups decided that their relative misfortune was due to the displeasure of Sidi Mhammed Sherqi. Consequently, since 1970, Trosh and Wlad Fennan have jointly offered a bull (not actually sacrificed) at his shrine. In earlier years these two sections never made joint offerings. The joint offering was made explicitly to reduce the expense, although tribesmen of both sections say that this economy does not reduce their expression of faith (niya) in the marabout. Similar reconsiderations of offerings occur among individuals. A tribesman of the Trosh section of Sma'la, a truck driver, recently stopped contributing to

the sacrifice. Shortly afterward, he had an accident for which he was held responsible. His misfortune was attributed to the anger of the shaykh. He has since renewed his contributions.

Sacrifices and other offerings at the main shrine are generally made at the level of tribal sections rather than local communities. Tribesmen pragmatically say this is in order to make more substantial offerings which will be acceptable to the marabouts. In contrast, each local community acts alone in slaughtering a sheep for a communal meal with their Sherqawi visitor during the festival. This meal generally takes place in the guest tent of the local community. In the past it often occurred at the house of the Sherqawi in town—at least when the visitor was wealthy enough to have a large one—but adamant pressure from the neighbors of visitors has discouraged what they consider "non-Islamic" rituals in their quarter. A few of the most prestigious tribesmen are invited to the house of their visitor at some time during the course of the festival, but never as a group.

The symbolism of the communal meal at the guest tent is quite explicit. In offering part of the meat of the sacrifice to their visitor, tribesmen say to him: "This sheep is for your ancestor. Eat! [Had el-hawli dyal jeddek, kulu,r\." His partaking of the meal reaffirms and strengthens the bond between the tribesmen and the marabout. At the end of the meal, a collection of money is made on behalf of the visitor. After it is handed to him, he responds with an invocation addressed to God and his ancestor Sidi Mhammed Sherqi. Typical invocations mention the long association between the marabout and the local community in question, often referring in abbreviated form to the various myths known by the tribesmen. The visitor asks on behalf of his clients for good weather, the fertility of their crops and animals, and the resolution of any special problems which the group has experienced or anticipates. Problems facing individuals in the local community are also mentioned, such as a serious illness or the lack of male offspring. If a tribesman thinks that the visitor is skipping over any request too lightly or has forgotten something, he will simply interrupt and ask that the matter be dealt with. As with sacrifices, comportment at invocations is casual: ubiquitous transistor radios play in the background, conversations proceed only slightly subdued, and women and adolescents pay little attention, if any, to the proceedings. Despite the supernatural powers attributed to marabouts, the attitude toward them is generally not one of awe. The tone of invocations is that of reasonable men seeking to coax another into good conduct. The fact that at times tribesmen employ light sarcasm and taunting, not of Sidi Mhammed Sherqi but of his descendants, implies the pre-existence of close ties between the parties.

*** Marabouts and Obligations

Underlying all ties with marabouts is the concept of obligation (haqq). Requests to marabouts must be accompanied by offerings, sacrifices, or the promise (wd'da) of them.[102] Unlike the relations of Spanish villagers to saints, which run along a spectrum from relations of instrumentality to affective relations (Christian 1972), Moroccan relations with marabouts all tend to be construed in terms of obligation. One Sherqawi said, "You [must] bring something to 'open' a matter with God [Nta te-tjib shi-haja bash yefteh Allah l-amr bi ha)." The same principle applies equally to gifts intended to induce persons to grant requests made of them. A tacit corollary of this instrumental exchange is that the only effective marabouts are those who are able to receive offerings or who have descendants and other persons "close" to them capable of doing so on their behalf. The caretaker of one of the shrines in Boujad stated the point as follows: "If you give something [to a marabout], there must be someone to pick it up. If not, there's no point in giving anything." This applies equally to collective offerings and

individual supplications. Of course, descendants of marabouts are present only at the larger and more popular shrines to take offerings and to aid supplicants in making their invocations.

As with other transactions of obligation, there is no formal economic reckoning of the exchange between marabouts and their clients. Nevertheless, a mutual sorting-out takes place. The faith (niya) of clients is thought to be shown in the value of their offerings. This must be commensurate with their own prestige, that of the marabout or visitor, and the nature of the request being made. An offering considered meager in relation to the rank (daraja) of the client or that of a marabout or visitor is construed as a lack of faith. Visitors do not hesitate to inform their clients when they are not satisfied with meager offerings. Moreover, correspondence from the nineteenth century indicates that such bartering for invocations is not a recent development. If offerings are meager, a marabout or prestigious visitor is thought to refrain from acting effectively on behalf of his clients, even if an invocation is actually made. In particular, the prestige of living marabouts suffers if they are accessible to clients able to offer only a chicken or a few eggs. Boujad's living marabout receives pilgrims during the fall festival and also writes amulets and says invocations on behalf of individuals throughout the year. Writing an amulet for a diminutive offering would serve to diminish his "word," since he customarily performs such services in exchange for significant cash contributions, the gift of animals, or, as once occurred in 1969, the title to a used car.

This marabout has the same problem as his predecessors of preserving his baraka through a comportment which maintains a social distance from all but the most prestigious of his clientele. In the last century Sidi ben Dawd daily rode on his mule around Boujad, listening to requests from townsmen, and regularly visited his tribal clients. But the actual settlement of disputes and other political negotiations, in which there always was the risk of failure or indecision, was tacitly delegated to Sidi 'Umar, his son. Significantly, Sidi 'Umar did not succeed his father upon his death but continued as the political counselor for the next marabout. The present marabout who actively encourages belief in his maraboutic powers can be seen publicly around Boujad, but he has virtually no clients in the town itself. No one pays him particular attention. However, on market days and during the annual festival he confines himself to his house, access to which is controlled by retainers, generally poor relatives. These stand at the door of his house and decide which pilgrims to admit. A direct refusal to a supplicant unable to afford the going price of his invocations would be considered improper. Occasional intervention on behalf of the destitute is considered an act of charity, but too frequent action on their behalf would dilute the economic and status base necessary to maintain his maraboutic reputation for baraka. Persons seeking an invocation with little to offer often try to secure recommendations, sometimes in writing, from the marabout's more affluent clients to avoid being turned away.[103]

The ideology of clients' remaining "connected" with marabouts emphasizes stability. Nevertheless, now, as in the nineteenth century, alliances between marabouts and their clients are contracted and broken. Tribal groups can become disillusioned with the ability of their marabout or visitor to sustain them with baraka. The visitor himself may drop some groups in favor of those capable of demonstrating their faith with more substantial offerings. As the scope of baraka attributed to marabouts has contracted in recent years and its intensity diminished, many such connections are broken at the death of the visitors, who, as I have indicated, often no longer have other Sherqawa willing to replace them.

Such shifts in alignments are not done whimsically but once decided upon are fairly easy to accomplish, both for the Sherqawa and for their clientele. Sherqawa do not comment among themselves upon who, if anyone, has baraka or the ability to communicate it. Only God, they say, has that knowledge. Baraka among the Sherqawa thus resembles the ethos of competitive settlement among merchants, who wait for God to bring them business rather than openly solicit it, so as to avoid overt friction among themselves. This ideological tenet is also secure from direct attack from Islamic reformists, as no formal assertion is made of the "closeness" of the Sherqawa to God. During fieldwork, I initially thought that certain Sherqawa were being evasive when, in response to my asking whether a particular marabout, living or dead, had baraka, they replied that the Bni So-and-So made such a claim. Their commentary was quite accurate. The "proof" of baraka is the existence of clients who act as if a particular marabout has it. This comes very close to a pure example of Weber's concept of charisma (Weber 1968:401).

This populistic determination of baraka is particularly apparent in the careers of living marabouts but holds equally for the careers of visitors and enshrined marabouts. Shrines, at least such major ones as that of Sidi Mhammed Sherqi, have a manifold symbolic appeal which partially insulates them from immediate political and economic vicissitudes. They also have an economic base not immediately dependent upon the offerings of pilgrims. The Sherqawa who manage the affairs of the main shrine have not distributed the accumulated offerings to the "children of the shaykh" in recent years. Instead, they have redirected this income into enlarging the shrine and building a hostel for pilgrims. Similar decisions have been made by the claimed descendants of enshrined marabouts elsewhere on the Tadla Plain. The effect is to upgrade the prestige of the shrine and to conceal the overall attrition of revenue.

As for living marabouts, at the turn of the century all client tribal groups were tied with either the lord of the 'Arbawi Sherqawa or the rival lord of the Zawya Sherqawa. As the ability of living marabouts to exercise their influence waned, so did their ties with client groups. Many groups have ceased maintaining ties with living marabouts, but continue them with visitors and make the annual pilgrimage. Groups that continue to renew their covenant with living marabouts (or in the case of the 'Arbawi Sherqawa, with a close relative of a person with such a reputation) generally have maintained allegiance with the same Sherqawi faction since prior to the protectorate. The longevity of these ties is largely due to the new social conditions introduced by the protectorate. The possibility of new marabouts emerging among the Sherqawa and asserting their identity was crippled by the French action in "freezing" the two rival lords and their successors into positions of prominence and fixing the lines of political identity for potential clients.

The situation of the one remaining Sherqawi marabout who actively seeks to maintain his reputation is especially precarious, since he depends directly upon revenue from pilgrims. Even as some groups sever ties with him and those who remain "connected" cut the size of their offerings, he is pressed to live up to his reputation for unrestrained generosity (karama) in entertaining them. During the fall festival, groups of several hundred pilgrims arrive in relays at his house. Each group stays for anywhere from one to three days and brings with it the animals and grain needed for its sustenance. To retain pilgrims, this marabout has in recent years added music and female dancers (shikha-s) for their entertainment, but their number is still declining steadily. A pending inheritance dispute may also bring about the division of the large house which is a manifestation of his baraka and in which he entertains guests. If the dispute goes against him, then he will lose most of the manifest symbols of his baraka. Unlike that of his predecessors, his own reputation for baraka is largely

demystified. Even through the 1930's, tribesmen popularly attributed to Sherqawa marabouts the capacity to change themselves into lions, among other miraculous deeds. The uncle of the present Zawya marabout (2–14) was reputed to have this capacity. The current marabout is not. Demystification means that living marabouts are now much more vulnerable to their immediate successes and failures.

The French tried to sustain the prestige of the Sherqawi marabouts by providing them with official sinecures, but their hold over other Sherqawa nonetheless became much less firm. This hold became even weaker with independence. Where once the Sherqawa were firmly identified with maraboutism, many Sherqawa now strive to separate the two identities as far as possible. I describe the cultural basis of Sherqawi identity and the process by which it became dissociated from maraboutism in the next chapter.

** 7. Sherqawi Identity

*** A Cultural Definition

A Sherqawi is defined by Moroccans as a patrilineal descendant of Sidi Mhammed Sherqi. Persons who claim descent from a common ancestor are normatively thought to constitute a descent group. When the claimed ancestor is a marabout, such persons are considered to be members of a maraboutic descent group. Sociologically viewed, however, they can best be described as what Harold W. Scheffler has called a “descent category.” In other words, the idiom of patrilineal descent “itself gives form only to categories of persons” of common patrilineal descent, and “these categories remain nondiscrete and only vaguely bounded” (Scheffler 1965:62). Membership in such a category does not imply an obligation to act in the common interest of that category. Rather, it is the presence of what are perceived as common interests, among which is the possibility of achieving or maintaining higher status, which encourages the formation of groups based on the claim to Sherqawi descent. Scheffler’s distinction between descent categories and descent groups is analytically quite useful. Some persons who are in the Sherqawi descent category are denied membership in Sherqawi descent groups. This largely comes about when the intensity and quality of their interaction with other persons recognized as Sherqawa falls below a certain level. Moreover, place of residence and propinquity to other Sherqawa, formally having nothing to do with the ideology of descent, are in practice crucial factors in shaping Sherqawi identity.

Predictably, those groups within the Sherqawa with significant interests to defend have their boundaries more sharply defined than the others. Recognition of Sherqawi identity follows the same principle of “closeness” that was introduced in Chapter 4. Thus the key question throughout this chapter is why and how identity as Sherqawa and as marabouts or their descendants is manipulated.

There are two separate aspects to Sherqawi identity. One is the formal genealogical ideology, which serves as a framework to conceptualize and legitimize a wide range of social relationships. The other is the question of how identity as a Sherqawi is pragmatically achieved and maintained. Signs of such identity include membership in a local group composed largely, but not exclusively, of persons appearing in a Sherqawi genealogy and residence in a Sherqawi quarter. They also include rights of inheritance as a Sherqawi through Islamic law, the conventions governing the distribution of offerings made at the various Sherqawi shrines, hypergamous marriage with commoners (i.e., the taking in marriage of commoner women but the giving of none in return), and explicit or tacit acceptance as a Sherqawi by recognized Sherqawa of high prestige.

As Scheffler has noted, the concept of descent group is itself inherently ambiguous: “A descent group is any group in relation to which a descent concept may be said to serve as one or more of the following: (1) a principle of recruitment (i.e., a criterion for membership); (2) a conceptualization of the unity of the group; (3) a statement of the actual or ‘proper’ composition of the group; and (4) a statement of the nature of the group’s relations with other such groups within the same set of groups (or society)” (1965:42). The

Sherqawi claim of shared patrilineal descent from a common ancestor shifts, often imperceptibly, between these various meanings. Sherqawiness, so to speak, is a condensed symbolization of several bases of social honor. The same is true of other assertions of “closeness” throughout Moroccan society. What distinguishes the Sherqawa in this respect is the intensity with which such identity is maintained and manipulated.

Ideologically, Sherqawi descent is characterized by claims to certain genealogical and mystical attributes. First, all Sherqawa are foqra (sg., fqif) , patrilineal descendants of ‘Umar ben 1-Khattab.[104] In some respects, foqra are treated like patrilineal descendants of the Prophet Muhammed (shorfa, sg., shrif). Like shorfa, the Sherqawa practice hypergamous marriage with commoners ^awam; sg., ‘ammi), that is, all those persons unable to claim descent from the Prophet or ‘Umar. Sherqawa and shorfa are, moreover, equal for the purpose of intermarriage. Thus, Sidi Mhammed Sherqi is said to have taken a wife from the Sa‘adi dynasty of shorfa (1555–1659). A more contemporary example of Sherqawi equality with shorfa is the current marriage of a prominent Sherqawi to the sister of the present king and royal consent to prefix Mulay to their son’s name, a prerogative normally reserved for shorfa.

As for mystical descent, Sidi Mhammed Sherqi is thought to possess mystical knowledge transmitted to him through a name-chain (silsila) of marabouts which ultimately reaches back to the Prophet. This knowledge has in turn been communicated by Sidi Mhammed Sherqi to other marabouts, primarily his own descendants but also some non-Sherqawa. As indicated in Chapter 1, the notions of the transmission of mystical knowledge and of patrilineal descent have popularly fused in Morocco, although, when the subject is explicitly discussed, educated Sherqawa distinguish between the two concepts. After all, it is known that bar aka is very unequally distributed among the descendants of marabouts. In principle, God determines the Sherqawi who has the most baraka at any given time, who then becomes lord (sid, mqaddem) of the zawya. But intense fights for succession in the past indicate that the signs of possession of such baraka have been highly contested by those who felt they could successfully stake a claim. Descent from or “closeness” to these maraboutic lords conveys substantial prestige to the rest of the Sherqawa. Some baraka is hereditary; “closeness” by descent from or kinship ties to a marabout in itself carries a presumed privileged access to their maraboutic relations. Even for those who presently deny that marabouts have the powers popularly attributed to them, Sherqawi prominence can be legitimated on other grounds: ancestors who have been distinguished both as religious scholars and as guarantors of social order in earlier, turbulent times, and the leading role of some Sherqawa in the contemporary Moroccan polity. But the possibility of separating genealogical from mystical descent is more apparent to the Sherqawa themselves than to their clients (or other commoners), who assume that all Sherqawa share in some degree the mystical powers of their ancestors.

The Sherqawa consider themselves at present to be divided into eight descent groups, each of which is associated with a residential quarter in Boujad. I specify “at present” because there are clear indications that the number of effective descent groups has historically shifted. Genealogies, after all, refer to the social situation of contemporary groups and persons, not to the dead. Six of these descent groups claim descent from six sons of Sidi Mhammed Sherqi—Sidi ‘Abd 1-Qader, Sid 1-Mursli, Sid 1-Ghazwani, Sid 1-Meknasi, Sidi ‘Abd es-Slam, and Sidi ‘Allal. The remaining two groups claim descent from maraboutic lords of the nineteenth century. (All Sherqawi lords claim descent from another of Sidi Mhammed Sherqi’s sons, Sidi ‘Abd 1-Khaleq [2–3]). ’

All prominent Sherqawa of the last two centuries have been from these latter two groups. Because they have had at their command the greatest material wealth and prestige, their members have had a competitive edge over other Sherqawa in controlling the resources of the religious lodge, access to both traditional and modern education, links with influential Moroccans elsewhere, appointment to government posts, and other strategic advantages. These are value-added, in the sense that prerogatives enjoyed in the past make it more likely that the same persons or those sponsored by them—generally members of their household, kinsmen, or clients—will enjoy similar advantages at later times.

The ideological core of Sherqawi identity and its internal differentiation is contained in genealogies and chains of "mystical" descent. These are regarded by the Sherqawa and others as symbolic encapsulations of Sherqawi histories. I use the plural because there are multiple ways in which the genealogies are constructed, understood, and related to each other. Each history is construed in terms of the social reality as seen by certain elements of society, even though the underlying pattern governing the generation of these histories is constant. At the same time, these conceptions of the past shape that reality both by internally relating the Sherqawa to each other and by linking them with the rest of society. In contrast to the genealogies of commoners (^awarn), the span of Sherqawi genealogies, that is, the number of contemporaries included in them, and their generational depth are significantly larger.

These qualities in themselves do not distinguish maraboutic from nonmaraboutic genealogies. Similar qualities are represented in the genealogies of "those who are distinguished" (nets khassa) on the basis of claims to prestige other than descent from Muhammed and 'Umar: families that claim a long tradition of Makhzen service, urban merchant families, families with a tradition of religious scholarship, and the like. As I indicated in my example of the formation of the Qsayra quarter (Ch. 4), social honor is legitimated whenever possible by the claim to a distinguished genealogy. For a commoner to assert similar genealogical knowledge would be considered presumptuous and improper. In contrast, the core genealogy of the Sherqawa is in the public domain. Not everyone, even among the Sherqawa, knows all of its key components, but everyone is aware of the centuries of maraboutic prestige of the Sherqawa, their numerous shrines in Boujad and throughout the Tadla Plain, and the reputations of some prominent contemporary Sherqawa (most of which are no longer based upon maraboutic activities). Claimed relations of kinship among the Sherqawa are also frequently much more complex than those that exist among commoners. For instance, the core of the 'Arbawi descent group claim kin relations through one of the fourteen sons and five daughters of Sid 1-Hajj PArbi (2–9). This lord had one legal wife and at least eight concubines. Many of these descendants, in turn, had large households, multiple marriages, and—for those who reached maturity in the years immediately preceding the protectorate—significant numbers of concubines. The Zawya Sherqawa show a similar complexity of internal relations. These descendants share complex rights to undivided inheritances through Islamic law, rights to the revenues of shrines, access as kinsmen to prominent Sherqawa, and such complex bonds of "closeness" based upon kin ties and other factors that multiple interlocking links can be made with other Sherqawa.

Few commoners elaborate their identity as a descent group in a similar fashion. Even among the Sherqawa, the importance attached to genealogical knowledge and to descent ideology varies considerably. The thinnest genealogical knowledge tends to be possessed by members of the six nonlordly descent groups. Each of these is associated with a shrine and a quarter in Boujad, although there are no formal activities associated with their particular shrines. The boundaries of inclusion in these groups are much more permeable

than those of the remaining two “main-line” descent groups, ‘Arbawi and Zawya. Long-term residents of the quarters associated with the non-main-line descent groups frequently claim Sherqawi descent and have this claim unchallenged in many contexts, even though they may not be able to claim a share (haqq) of the offerings of the principal shrine.

In principle, the Sherqawa maintain registers of descendants of Sidi Mhammed Sherqi, just as registers of descendants of the Prophet are supposed to be kept. Nevertheless, such formal determination of descent-group membership is germane only for the distribution of offerings made at the main Sherqawi shrines. These registers are largely inaccessible, and many Sherqawa correctly maintain that they are incomplete and out-of-date. Much more important is being “known” (me‘ruf) as a Sherqawi in face-to-face, ongoing social relationships. In these terms, members of the non-main-line groups have only a truncated body of genealogical lore to establish their legitimacy. They know by name none of their intervening ancestors between the present and the sons of Sidi Mhammed Sherqi from whom they claim descent. Moreover, the span of known contemporary relationships is generally much narrower than that known by members of the main-line groups. Nor do these individuals have anything to gain in material interests by expanding the span of their relationships or by drawing attention to their genealogical claims.

In contrast, members of the main-line ‘ Arbawi and Zawya descent groups show a much greater awareness of the boundaries of their groups and can generally trace in detail their genealogical links to one of the nineteenth-century Sherqawi lords. Consequently they sharply delineate between members of their descent groups and mere inhabitants of their quarters who may claim “closeness” with them. These two groups have substantial common interests and have in general managed to defend them. Many of the estates of their prominent nineteenth-century Sherqawi ancestors have remained undivided, entitling many of them to substantial revenues through Islamic inheritance in addition to those from shares in the offerings at the main shrine, available in principle to all Sherqawa. In themselves, these two forms of rights are insufficient to provide members of the main-line groups with a livelihood, although they constitute an important addition to the income of many households. More so than members of other groups, main-line Sherqawa maintain houses in their respective quarters to substantiate their identity, rather than locate themselves wherever there is satisfactory housing, as members of other descent groups tend increasingly to do.

Even in these two descent groups, most Sherqawa do not know in detail the wealth of genealogical resources available to them, although all parts of the genealogy described below are known by them to exist and can be activated when there are reasons to stress or to forge specific links. Significantly, it is the most influential Sherqawa who possess the most elaborate knowledge of these genealogies and capacity to use them to further their interests. This social distribution of knowledge has already been described in the context of rural Morocco (Ch. 4). For all but certain highly educated Sherqawa, these genealogies are accepted in their entirety as being historically valid. They unquestionably are, in the sense that for many they constitute history as locally understood. Other Sherqawa discriminate between those sections of the genealogy which are corroborated by written historical accounts and are relatively fixed—such as the succession of Sherqawi lords (Fig. 2)[105]—and other elements of the genealogy, such as the links between Sidi ‘Umar in the seventh century and Sidi Mhammed Sherqi in the sixteenth or the links of descent from one of the nonmain-line sons of Sidi Mhammed Sherqi. The act of writing and formally recording parts of the genealogy renders them immutable, while the other, unwritten claims are tacitly recognized by the Sherqawi elite as mutable.

The various sections of the genealogy presented below do not quite add up to a composite whole, since each of its components tends to be used as the ideology for certain types of social relations. Even over the last forty years, there have been considerable shifts in how they have been elaborated. For this reason I think it important to specify as carefully as possible the social contexts in which they are elaborated.

*** “Closeness” with ‘Umar: The Proto-Sherqawa

The claimed patrilineal link between Sidi Mhammed Sherqi and ‘Umar ben 1-Khattab is not known in any detail to the great majority of the Sherqawa and their clients. Nor is there any concern to know it, since there is no active contest of the claim and no current use to which this part of the genealogy is put. The fact that Sherqawa have for generations intermarried with descendants of the Prophet on the basis of such descent is considered sufficient evidence of such a link. Claims to descent from ‘Umar have been subject to skepticism by Moroccan religious scholars for centuries, an indication that the current skepticism of educated Moroccans about such claims is not novel.

In one elite account of the links of Sidi Mhammed Sherqi with

‘Umar (Fig. 10) there are twenty-two intervening ancestors. Alternate generation naming is a very common feature of Moroccan genealogies; so the repetition of names in this genealogy is to be expected. However, no biographical information is attached to any of the first fourteen descendants of ‘Umar, those who presumably remained in Arabia.

There are several uses which the Sherqawa make—or, more accurately, made—of the remainder of the genealogy, depicting Sidi Mhammed Sherqi’s ancestors who lived in Morocco. One is purportedly to document their association with Morocco’s reigning dynasties. The other is to relate the Sherqawa to some of their tribal clients. Thus, Sidi ‘Abdallah (10–1) is said to have left the port of Yanbu‘ in Arabia at an unspecified time for the Tafilalt region of southern Morocco. This region is important as the birthplace of the two major Moroccan dynasties that claim descent from the Prophet Muhammed, the Sa‘adi and the ‘Alawi. Since more concrete examples of such ties can be found at later periods and in the present, these earlier assertions of association with the shorfa dynasties are generally offered in a tentative fashion and are not pressed if skepticism is raised about them.

There is a third use for this part of the Sherqawi genealogy. As recently as forty years ago, a claim of descent from a proto-Sherqawi was a means of asserting a tie of “closeness” between Sherqawi marabouts and their clients without giving the clients the status of mara- boutic descent. Unfortunately, the lack of more detailed contextual information of how these claims to “closeness” were asserted makes it difficult to assess their significance with any precision. In the period of my fieldwork, several Sherqawa and some of the tribal elite still claimed a fqir status for their tribes without being able to specify the basis of this claim. In the 1930’s, in contrast, Claude Ecorcheville elicited an elaborate schema of such links from Sherqawi notables (Fig. 11). Since the number of Sherqawi clients has contracted in recent years and maraboutic ties have been significantly downgraded and divested of political implications, there is currently less interest attached to elaborating such links. In Ecorcheville’s tribal version, Sidi Mhammed Sherqi’s ancestors are part of the twelfth-century Bni Jabir of western Morocco.[106] I have heard no one

carry this claim to its logical conclusion and assert that all the tribes of western Morocco descended from ‘Umar are foqra like the Sherqawa. In particular, neither the Sherqawa nor the tribal elite suggest that the assertion of descent from ‘Umar enabled such tribes to take women homog- amously from Sherqawi foqra or from shorfa. This conceptual ambiguity in the use of the term foqra does not constitute any perplexity for informants. Clearly, the claim of fqir status has two components, patrilineal descent from ‘Umar and, as shall be described, mystical ties with Muhammed.

[[d-f-dale-f-eickelman-moroccan-islam-18.png][Figure 11. Ancestors of Sidi Mhammed Sherqi. (Based on Ecor chenille 1938.)]]

It is a mistake, I think, to assume that these genealogies are intended to be rigorously scrutinized. Each serves as a conceptual grid, parts of which can be utilized to construct or legitimate contemporarily significant social relationships. What is important is that there are available certain nodes on the genealogies through which certain relationships can be asserted. These are not random, of course, yet evidence a considerable flexibility. Many of the Sherqawa represented in the various genealogies have shrines or tombs on the upper Tadla Plain, although the exact identity of such marabouts is often ambiguous. For instance, informants are uncertain as to which represent ancestors or brothers of Sidi Mhammed Sherqi. These ambiguities mean that Sherqawa and tribesmen can convincingly manipulate the genealogies to provide meaningful representations of contemporary social realities. The physical presence of shrines of certain Sherqawa (or proto-Sherqawa) who figure in these genealogies, even if only vaguely perceived by many tribesmen, anchors the Sherqawa securely in the geographical and social morphology of the region under their influence.

Thus, in Figures 10 and 11, Sidi Hmama (10–2) is claimed as the ancestor of the tribe in Shawya (located near the town of Ben Hmed) which bears his name. Sidi Muhammed el-Mehdi (10–3), whose tomb is in the midst of a public garden constructed by the French at Wad Zem, is not currently connected with any tribal group. In the 1930’s, however, individuals claiming descent from him attempted to initiate collective pilgrimages from the surrounding tribes (Ecorcheville 1938). Had this attempt been successful, then it is likely that elaborate genealogical schema would have been produced and accepted to link this marabout to his clients. The proof of “early” relations is the pattern of existing or potential social relations.

The biographical glosses associated with the sons of Sidi Muhammed el-Medhi confirm this suggestion. Sidi Bettah is said to have remained in Tafilalt, while Sidi Smayn was “childless.” In collecting contemporary kinship data, childlessness is attributed equally to persons without descendants and those whose descendants are unknown. In the latter case the term also implies that no one presently claims relationships through a particular person. Sidi Smayr and Sidi Bhar are eponymous ancestors for tribal groups that are Sherqawi clients located about forty kilometers to the northwest of Boujad. Finally, Sidi Hammu (10–4) and his grandson, Sidi Muhammed Za‘ari (10–6), have tombs in Boujad’s rural hinterland. The former is on the Wad Bu Gerrum (Tashelhit dialect, “Stream of the Marabouts”) ; the latter on Wad Tashraft (Tashelhit, “Stream of the Shorfa”). No known tombs represent the remaining persons who figure in this part of the Sherqawi

genealogy.

Claims of descent from one of the eight brothers of Sidi Mhammed Sherqi are used much in the same way as claims of descent from one of the proto-Sherqawa. These eight are Sidi ʻAli Filali, Sidi ʻAbd er-Rahman. Sidi 1-Werdi, Sidi ʻAbd en-Nebi, Sid et-Tunsi, Sid es-Seʻid, Sidi ʻAbd l-ʻAziz, and Sidi ʻAli (or Muhammed) Smuni. One of these, Sidi ʻAbd en-Nebi, has a shrine adjacent to that of Sidi Mhammed Sherqi. Another two, Sidi ʻAbd l-ʻAziz and Sidi ʻAbd er-Rahman, have shrines near Wad Zem. One, Sid es-Seʻid, has a shrine in Tetouan. Three of these brothers (Sidi ʻAbd l-ʻAziz, Sidi ʻAli Smuni, and Sidi ʻAbd en-Nebi, are claimed as eponymous ancestors of tribes in the Shawya that are clients of the Sherqawa. Not all informants agree on the number of brothers attributed to Sidi Mhammed Sherqi. Some are considered by different informants to be merely “close” to him, his brothers, or possibly his ancestors. Informants often do not consider the exact relationship to be as important as the fact that a relationship exists. Like descent from an ancestor of Sidi Mhammed Sherqi, the genealogical grid provided by the shaykh’s brothers has the potential for establishing new links between marabouts and clients. Thus in the 1930’s, when there was still considerable maraboutic activity, some tribesmen from Wlad Seʻid (Shawya) claimed descent from Sidi ʻAbd l-ʻAziz and unsuccessfully tried to establish his tomb near Wad Zem as a pilgrimage center (Ecorcheville 1938:36).[107] In the past, such descent was also frequently claimed by groups of inhabitants of Sherqawi estates (ʻazib-s) (Eickelman 1972–1973:52—53). There is no indication, however, of whether such a status provided individuals with prerogatives beyond those enjoyed by the other inhabitants of the estates.

Claimed descent from a brother of Sidi Mhammed Sherqi can also be used as a means of legitimating social honor. Currently a family of non-Sherqawi merchants who have supplied prominent local leaders of the nationalist movement claim descent from Sidi ʻAli Smuni. This reputed brother of the shaykh has no shrine in Boujad, although a quarter (6–20) founded in the 1930’s bears his name in addition to the now more common name Khaluqiyin. His claimed descendants maintain that Sidi ʻAli, in contrast to Sidi Mhammed Sherqi, was like themselves a “progressive,” thus making descent from him more significant (although they admit, less known) than descent from Sidi Mhammed Sherqi. For the benefit of outsiders, such as myself, they reasoned that, since they were descendants of ʻUmar and of a brother of Sidi Mhammed Sherqi, they also were Sherqawa. Sherqawa point out that the family in question is of fairly recent tribal origin and that in any case no one else claims such descent. This latter argument is reminiscent of that used by al-Qadiri in the seventeenth century to question the Sherqawi claim of descent from ʻUmar. Seen sociologically, the claim of such descent has the advantage of avoiding a direct threat to the material rights of direct descendants of the shaykh.

*** The Mystical Heritage

Until the 1930’s, particularly in rural Morocco, a traditionally educated person was assumed to know something of the religious sciences (ʻulum^ sg., “Urn) and of the connections which historically existed among marabouts with mystical knowledge (al-asrar., lit., “the secrets”). Such knowledge legitimated their claims to high status in the eyes of others. At present, only the elderly know such ties with any detail. Since the ascendancy of the reformist and nationalist movements in the 1930’s, specific awareness of this body of knowledge has ceased to be part of the intellectual baggage of the younger elite.

The particular name-chains (silsila-s) through which mystical knowledge is acquired once were of vital political significance, as in the sixteenth-century struggles between marabouts supporting the Ottomans in Algeria (see Ch. 1). Knowledge of such chains continued to be significant through the 1930's, at least as a means of social legitimation of mystical insight.

Most Sherqawa and tribesmen know these chains of legitimation only through the myths and legends associated with the maraboutic tombs and shrines that dot the landscape. For instance, Sidi Mhammed Sherqi is linked in popular myths with the marabout Sidi Hmed bel Gasem, whose shrine and descendants are in Bni Mellal. In the popular conception of "closeness," this physical propinquity assumes more weight than the written record, known only to a few, which states that the two marabouts studied together (Qadiri 1913: 129). But this interlocking of written sources, known to exist even by tribesmen, with more popular accounts of these marabouts serves to reinforce the popular acceptance of the latter.

These mystical ties, like all others in society, are represented as dyadic relationships. Some of Sidi Mhammed Sherqi's mystic links with the Prophet are through his father, Sidi bel Gasem (10–7). His shrine is not far from Qasba Tadla, on the southern bank of the Umm er-Rbi' River. On the opposite bank is the shrine of Sidi Mhammed Sherqi's mother, Laila Rahma.[108] Sidi bel Gasem is said to have studied religious sciences and mysticism with 'Abd l-'Aziz et-Tebba (d. 1508), one of the fountainheads of the pro-Moroccan mystic tradition mentioned in Chapters 1 and 2.

Most of the major marabouts of western Morocco are popularly considered to follow the teachings of Shaykh et-Tebba. Their shrines form a line along the piedmont between the Atlas Mountains and the western plains. Besides Sidi Mhammed Sherqi, these disciples include Sidi 'Abdallah ben Dawd esh-Shawi, whose shrine is at Ksiba (originally said to be from Wlad Bu Ziri in Shawya); Sidi 'Ali u Brahim and his disciples, whose shrines and clientele are in the Bzu region, near Sraghna; and Sidi Rehhal, who founded a religious lodge east of Marrakesh which bears his name. All of these marabouts are mentioned in traditional historical accounts and figure in popular myths and legends as mutually confirming and acquiring each other's baraka. One myth, for instance, describes Laila Rahma as childless until, unaided by her husband, she took a bull as an offering to 'Ali u Brahim. Subsequently she gave birth to Sidi Mhammed Sherqi. Later, when she again encountered 'Ali u Brahim, the infant Sidi Mhammed Sherqi sucked nine of the ten toes of Sidi 'Ali while he was asleep and thus acquired much of his baraka.

One distinct facet of the heroic age of Sidi Mhammed Sherqi as popularly represented is the tendency of mystic insight to flow freely among those who sought it, regardless of their other bonds. Later, such insight is seen to be preferentially (but never exclusively) transmitted along the lines of patrilineal descent. The term secret of the ancestors (sirr l-aslaf) applies mostly to the transmission of baraka after this heroic age, not before. (Traditional educated opinion does not make the synthesis of transmission of knowledge through mystical ties and through genealogical descent.) Sidi Mhammed 1-Ma'ti (2–4), the third lordly successor of the founding marabout, is buried just outside Marrakesh in the same shrine as one of his Sufi masters, Brahim Tamili (Ecorcheville 1938:38). Such physical propinquity is often taken as evidence of the transmission of baraka between two marabouts.

*** Descendants of Sidi Mhammed Sherqi

The Sherqawa proper are those who claim direct descent from Sidi Mhammed Sherqi. Because such claims involve substantial material rights and social honor, they are more sharply defined and contested than those previously discussed. Still there is considerable variation among the Sherqawa proper as to how their identity is conceived. Even among the Sherqawa there is a shifting of claimed ancestors similar to the pattern described earlier for the residents of the Qsayra quarter. This is particularly apparent in the changing relationship between descent groups and enshrined marabouts. As mentioned above, there are presently eight Sherqawi descent groups in Boujad, but a larger number of Sherqawi ancestors are available to serve as points of differentiation. Several other descent groups are vaguely recognized or thought to exist elsewhere. Thus, there were no recognized descendants of Sid et-Tanje, a son of Boujad's founding marabout who has a tomb in Boujad, until a group of roughly one hundred persons living in Fes claimed a proportionate share of offerings to the Sherqawa in the late 1920's. According to one Sherqawi notary, this claim was supported by the sultan, perhaps to irritate certain Sherqawa.[109] The annual share of these claimants was in principle forwarded to Fes by the qaid of Boujad until independence in 1956. With independence it became impolitic to press such claims, which seem to have disappeared with the transfer of power. Older Sherqawa are aware of the earlier existence of this group; younger Sherqawa are not. Similarly, the Sherqawa in Boujad recognized the existence of descendants of Sid ed-Deqqaq and Sid 1-Harti in the Shawya (Ecorcheville 1938) and of Sid 1-Malki among the Bni Hasan in the Gharb (Gouvion and Gouvion 1939). Of these three marabouts, only Sid 1-Harti has a tomb in Boujad, although all three are mentioned in myths. Currently, even older Sherqawa are unaware of any descendants of these three marabouts. No major community of Sherqawa is currently known to exist outside of Boujad, although there were many such groups in the late nineteenth century.

Principal Locations of Claimed Descendants

| — Sidi 'Abd 1-Qader (2–2) | Qadiriyin quarter (6–8) |

| — Sid 1-Mursli | Mursiliyin quarter (see Ch. 4, n. 2) |

| — Sid 1-Ghazwani | Ghazawna quarter (6–6); Shawya |

| — Sid 1-Meknasi | Mkansa quarter (6–3); Shawya |

| — Sidi 'Abd es-Slam | Old Sellamiyin quarter (6–4) |

| — Sidi 'Allal | 'Allaliyin quarter (6–7) |

| Sidi 'Abd 1-Khaleq (2–3) | Zawya (6–2) and 'Arbawi (6–1) quarters |

| Sidi Mhammed Sherqi | ---------- |

| — Sid 1-Harti | Shawya |

Figure 12.

Sons and daughters of Sidi Mhammed Sherqi.

Each major descent group within the Sherqawa has shrines of its key ancestors associated with it, although the correlation is not exact. Two of the shaykh's twelve sons, Sid 1-Mursli and Sidi ʻAbd 1-Qader, have shrines in the same compound which houses that of their father. Five others, Sidi ʻAbd es-Slam, Sid 1-Ghazwani, Sid 1-Meknasi, Sid 1-Harti, and Sid et-Tanje, are grouped on a promontory just outside Boujad.[110] Only the ʻArbawi and Zawya quarters currently have shrines within them.

The principal ʻArbawi shrines are those of leading Sherqawi lords: Sidi Mhammed 1-Maʻti (2–4), Sidi Saleh (2–5), Sid 1-Maʻti (2–6), and Sid l-ʻArbi (2–7). All of these are elaborate, ornate structures dating from the preprotectorate era. Two of them also have adjoining mosques. These shrines receive steady flows of donations, although not so large as those offered at the shrine of Sidi Mhammed Sherqi. Several also receive the collective visits of tribal groups during the fall festival, although covenants with the Sherqawa are renewed only at the main shrine.

The most significant of these shrines is that of Sid 1-Maʻti (d. 1766) (2–6). This marabout is the only Sherqawi to have founded a religious brotherhood (tariqa) that acquired as adherents a number of townsmen. Members of the brotherhood and subsidiary lodges are found in Bni Mellal, Qasba Tadla, Wad Zem, Fqih ben Saleh, Rabat, and Casablanca. One also was located at Khnifra, in the Middle Atlas Mountains, according to Francois Berger (1929:47).[111] However, no Sherqawa are presently aware of the existence of this lodge or of when it disappeared. In the past, tribesmen also swore alliances between groups over Sid 1-Maʻti's sepulcher (see Ch. 4). As with the other shrines in the ʻArbawi quarter, no sacrifices are permitted, although each shrine has a box (senduq) in which offerings are placed. These go entirely for the upkeep of the shrines and are not distributed to descendants.

The shrines located in the Zawya quarter all date from the protectorate: those of Sid 1-Hajj Muhammed (2–10), Sid 1-Hajj ʻAbd 1-Qader (2–14), and Sidi ben Dawd (2–15). In contrast with those of the ʻArbawi quarter, these are all modest structures which are locked most of the time and receive only rare visits from pilgrims.

Although common descent from these marabouts gives their descendants certain rights and prerogatives, it would be wrong to conclude that even with respect to their shared rights they act collectively. The critical factor is how individual members of these descent groups view such rights in relation to their overall interests.

Sherqawa claim there are two activities that represent their collective identity: (a) formal visits paid by representatives of each descent group to Boujad's prayer-leader (imam), presently a non- Sherqawi, on major feast days and (b) shares (hdqq-s) in the offerings made at the shrine of Sidi Mhammed Sherqi.

Each Sherqawi descent group has a flag, which is usually draped over the tomb of the group's ancestor or kept in custody by a group member. On feast days each group has a representative who carries the flag of their common ancestor to the house of the imam. There they breakfast prior to the public prayer and then accompany the imam to the prayer-ground or mosque. Similar emblems are kept by each of the "respectable" religious brotherhoods present in Boujad, the Kittaniya, Tijaniya, Qadiriya, and Nasiriya. Their representatives also accompany the imam^ so participation in this ceremony does not in itself distinguish the Sherqawa from other groups, although only the Sherqawa participated in it prior to the protectorate.

In the past, however, this ceremony was more distinctive, for the lord of the Sherqawa was also the imam. This meant that he was the symbolic leader both of the Sherqawa and of the Muslim community as locally represented. In principle, there is only one prayer-leader in each town for the major Islamic feasts. He offers a sacrifice of a sheep at the mosque or prayer-ground (jnsalla) before the assembled community. After the communal sacrifice, others are made in individual households. Since the Sherqawa had in effect two lords (sids) after the split of the zawya in 1901, both served as imams on feast days and sacrificed on behalf of the assembled community for at least part of the period of the protectorate—at least until the late 1930's. The "masters of the flags" (mwalin l-allama) of the Sherqawi descent groups and religious brotherhoods paid visits to both. Eventually reformist pressure and a changing ideological climate among Boujad's bourgeoisie brought a halt to this de facto dual zmzzm-ship. Informants are now reluctant to speak of this practice because it is in such open contradiction to current understandings of Islamic conduct.

At first sight, the present system by which the shares (haqqs) of the revenues of the main shrine are allocated appears to offer the sharpest delineation of Sherqawa from non-Sherqawa. Each patrilineal descendant of the shaykh, male or female, is supposed to receive an equal share. This system of distribution is in contrast to the rules of Islamic inheritance, which provide differential shares for men and women for varying degrees of relation. There is a register of all those entitled to a share of the shrine offerings. In 1969, it listed 5,582 shareholders, clearly not all of the living descendants of the founding marabout, especially given the multiple wives and concubines of his key descendants. In formal terms, each of the eight major Sherqawi descent groups has a spokesman (mqadderri). He looks after the shares of those in his groups, keeps track of who is entitled to them, and participates in the administration of the shrine. [112] These spokesmen form a council (jma'a) , which is supposed to decide on the distribution of the offerings after deducting expenses for the maintenance of the shrine and salaries for certain of its employees, not all of whom are Sherqawa. One of the major decisions of this council in recent years has been to construct a hostel for pilgrims adjoining the shrine. They also offered a lavish reception for the king when he visited Boujad in the mid-1960's. In practice, this council is joined by prominent Sherqawa, who often have a decisive influence on the proceedings and who occasionally overshadow its formal members. Under the protectorate, the council was effectively controlled by the Sherqawi qaid, but it presently acts with more autonomy.

The utility of rights to the offerings as a means of identifying Sherqawa dissolves upon closer examination. The present formal system of allocations was the result of administrative intervention early in the protectorate. Prior to 1912, no formal council managed these offerings. Their distribution was made daily on an informal basis to descendants of the marabout and anyone else who happened to be present. Since such offerings were considered alms, wealthier Sherqawa made no claim upon them. In practice, only the nonlordly descent groups laid claim to them. Decisions relative to the upkeep of the shrine were made by the lords. Since they received substantial offerings directly from their regular clients and other pilgrims, the cost of maintaining the shrine constituted no major burden upon them.

Shortly after the French set up an administrative post in Boujad in 1913, this arrangement broke down. One of the first acts of the French was to allot tax and corvee obligations by quarters. For these purposes, spokesmen for the two rival main-line descent groups, each with their separate quarter, claimed to the French that they really were one quarter.

The other six Sherqawi descent groups, which more than today clustered in separate quarters, protested this decision. They were led by a Sherqawi of the Mkansa descent group/quarter, who later became one of the first government shaykh-s for Boujad, in part because he came to the attention of the French during this dispute. The leaders of the two lordly descent groups—the qaid, Sid 1-Hajj ʻAbd 1-Qader (2–14), and the qadi. Sidi ʻAbdallah ben l-ʻArbi (2–13) — made a counterproposal. They would acquiesce to the demand that their quarters be considered separate for the purposes of corvee and taxation, on condition that henceforth each member of their descent groups would receive his proportionate share of the offerings at the main shrine. This significantly reduced the allocations to members of the other descent groups.

The dispute was quickly carried to Rabat, where two crucial decisions were made. First, it was decided that offerings to a mara- boutic shrine were not governed by Islamic law and instead should be divided in equal shares among all living patrilineal descendants of the marabout. Second, to determine who these were and to distribute the offerings, a spokesman (mqaddem) was designated for each descent group. Offerings were to be distributed annually after deducting the upkeep of the shrine.[113]

An unintended consequence of this formalization of descent-group rights and obligations has been to render apparent to the Sherqawa discrepancies between their formal ideology, according to which they include all living descendants of the marabout, and the reality, which is that they are limited to a considerably smaller number who actually claim this descent, primarily members of local descent groups in Boujad itself. Moreover, no Sherqawa entitled to share in the distribution of the offerings are under the illusion that the formal spokesmen act in their collective interest. “In the end,” one of them said to me, “each of us is his own spokesman” (koll wahed mqaddem da rasu). Consequently the formal overseers are complemented by “shadows” who meet with them whenever matters of shrine upkeep or revenues are discussed. Among these “shadows” are several notaries as well as other Sherqawa who claim to represent by proxy a certain number of shares. Many solicit the shares of Sherqawa who, because of antimaraboutic scruples or personal wealth, allow less affluent kinsmen to collect in their name.

In sum, the right to a share of the offerings at the principal shrine, like all other

prerogatives claimed by the Sherqawa, exists in so far as it is defined and defended in social action. Rights held in common do not necessarily imply corporate activities any more than holding a formal office in itself legitimates authority in a given sphere of activity. Legitimacy is not sharply defined in traditional Moroccan society. Thus, in some circumstances the exercise of one's formal right to a share of the offerings at Sidi Mhammed Sherqi's shrine, or even the implicit assignation of it by proxy to another Sherqawi, can result in a diminution of social honor. Now as in the past, the distinction is blurred between rights or privileges abstractly held and their actual exercise.

*** Marriage Patterns

Another marker of Sherqawi identity is the maintenance of a pattern of hypergamous marriage with commoners and homogamy between themselves and descendants of the Prophet.[114] Boujadi-s and other Moroccans say that descendants of the Prophet (shorfa) and of 'Umar (faqra) constitute one "field" (badiya) for marriage. Commoners constitute another. This conception is accepted by all elements of society. One commoner (a tailor) said: "How can I marry a descendant of Sidi Mhammed Sherqi or the Prophet? If I get mad at my wife, I want to beat her. Can I beat a descendant of the Prophet or Sidi Mhammed Sherqi? Do I want their curse upon me?"

It is also popularly believed that the children of such marriages (i.e., of male commoners with female descendants of the Prophet or 'Umar) die soon after birth. Regardless of their other qualities, descendants of the Prophet and 'Umar possess a substance which makes them stand apart from those who do not possess it.

When expressing their ideas about marriage, neither Sherqawa nor commoners emphasize the hypergamous pattern described above. Instead, they explain their preference for marriage to those who are "close to us" (qrib Una). "Closeness," as I have emphasized throughout this study, has multiple dimensions, only one of which involves kinship. Frequently, Sherqawa claim that they are distinguished from commoners by their preference for marriage among themselves, but this is not borne out in practice (see Table 6). For instance, Sherqawi genealogies indicate that the most prominent household units have the highest rate of marriage to non-Sherqawa. This is not surprising, since marriage is one means of cementing political relations between individuals and groups. As Table 6 indicates, the rates of marriage to claimed kinsmen are roughly equal for both Sherqawa (48 percent) and rural commoners (50 percent).[115] This table should not be assumed to be an indication of the "actual" relations existing between marriage partners. As I have indicated in earlier contexts, criteria for kinship vary greatly.

The first column of Table 6 indicates the proportion of bent 'amm marriages—marriages between a man and his father's brother's daughter (or other woman so designated)—for each group specified. This type of marriage is often claimed to be a preferential one in Arab society, although informants cite as many proverbs and justifications against it as for it. My table represents informants' claims for such marriages, whether or not they could demonstrate with precision that the marriage was between paternal cousins. The actual relation of the wife to the husband often is that of father's father's brother's daughter, a matrilateral link, or one in which the genealogical tie is tenuous or undemonstrable.

How asserted genealogical links are manipulated depends on the total context of social relations between contracting parties, not just a narrow range of kinship considerations. One advantage of claiming a bent ‘amm relation is that the groom’s household can offer a smaller bridewealth than otherwise would be possible. The offering of a smaller bridewealth due to claims of a bent ‘amm relation is particularly widespread among tribesmen and among rural immigrants to Boujad, among whom written marriage contracts are less often concluded because of the notarial fee levied on written agreements registered with the Islamic court and the reluctance of tribesmen to reveal their financial resources to notaries, whom they mistrust, often with justification.[116] The “closeness” of a bent ‘amm relation generally is claimed between neighbors in the same or adjacent ddwwar-s. In town, such “closeness” often emerges from (or fuses with) relations of residential propinquity, a shared craft or trade by the two heads of households, or similar ties.

Table 6.

Marriage patterns of Sherqawa and commoners

| Bent ‘Amm Marriages (N) (%) | Marriages to Other Claimed Kinsmen | Marriages to Non-Kin |

| (N) | (%) | (N) | (%) |

| Sherqawa (N = 303) | 92 30 | 55 | 18 | 156 | 51 |

| Town-born commoners |

| (N = 124) | 17 14 | ^a | ^a | ^a | ^a |

| Rural commoners |

| (N = 234) | 51 22 | 65 | 28 | 118 | 50 |

Note-. Because of rounding off of decimals, percentages do not always total 100%.

^a A break-down for town-born commoners is not available. There were 107 town-born commoners who had non-bent ‘amm marriages (86% of all town-born commoners).

The second column of Table 6 indicates marriages designated by informants as between relatives, but for which the genealogical link was not always clearly specified. Among the Sherqawa of Boujad, this generally meant marriage to a Sherqawi outside one’s own immediate quarter or descent group, as when an ‘Arbawi Sherqawi married a person who resided in Ghazawna quarter (6–6) and claimed descent from Sid 1-Ghazwani. Since the ‘Arbawi is the more prestigious descent group of the two, the span and (to a certain extent) the depth of exact genealogical knowledge of a person from that descent group are usually much greater than those of one from Ghazawna. The latter’s identity as a Sherqawi depends more upon being “known” as one to other Sherqawa than upon exact genealogical reckoning. Neither Sherqawi would be able to demonstrate specific genealogical links with

the other. Thus, even among the Sherqawa of Boujad, there is room for ambiguity in identifying who are descendants of the founding marabout.

Hence the only significant difference which remains between commoners and Sherqawa is that of hypergamous marriage. Of the 303 Sherqawi marriages analyzed, there were only 25 exceptions to the pattern of Sherqawi women not marrying commoners. Twenty- one of these cases were of women no longer living in Boujad who did not maintain close ties with kinsmen in the town. Outside of Boujad, they had more latitude of personal identity. Significantly, many of these cases involved second marriages, the first having been with Sherqawa. Of the remaining 4 cases in Boujad itself, the activities of two of the husbands made them more or less the equals of Sherqawa. One was a Qur'anic teacher; the other had for many years collected offerings at the main Sherqawi shrine. The other 2 marriages both involved women of the non-main-line descent groups.

*** The Dynamics of Social Identity

The analysis of Sherqawi identity is important not only for an understanding of maraboutism but also for what it reveals of the dynamics of Moroccan social structure. The problem of discerning the constituent units of North African society has already been discussed in earlier chapters. Maraboutic descent groups show the same flexible patterns of boundary and identity as do urban quarters and rural social organization, the two examples that were earlier discussed at length. It is not the actual personal or group identities existing at any given moment that are the key to understanding Moroccan social structure, but the forces at work in any given situation. These include both a shared consciousness of the nature of social reality and the actual shape which social action takes. Under the impact of new conditions, the concepts through which Moroccans understand the social order, like those of other societies, themselves undergo transformations. Ordinarily, Moroccans are not aware of these transformations in how they perceive social action. Here the "native" conception of the social order and the anthropologist's analysis of it necessarily diverge.

Sherqawi identity is a concrete manifestation of Moroccan symbolizations of the kinds of connections that can exist between persons and the ways in which these connections can be manipulated. It would be misleading to imply that Sherqawi identity is open to anyone who simply strives to acquire it. A combination of attributes, including residence, descent, marriage patterns, political and economic alliances, and other aspects of comportment make one "known" as a Sherqawi. Most Sherqawa are known to each other through face-to-face relationships, so that acquiring prominence on the basis of an assumed Sherqawi identity (i.e., one that has not previously been maintained) is quite difficult. But asserting a marginal identity as a Sherqawi, even in a "company town," such as Boujad, is not uncommon. Some persons are motivated to do so for the social honor that such a claim implies, at least to other non-Sherqawa. Others pose as Sherqawi "visitors" during the fall festival for financial gain. Only in certain contexts do at least certain Sherqawa make public issue of the boundaries of their identity.

Since Sherqawi identity is merely a specialized case of the more general issue of the nature of social identity in Morocco, I think it useful to present graphically my conception of how the cultural basis of Moroccan identity contrasts with alternative sociological notions. Figure 13 is a standard, downward-branching model of social relations and hence requires only a brief explanation. The irregular but firmly-bounded shapes at the bottom of the diagram represent actually existing groups. According to this model of society, these

groups see their relations almost entirely through the various levels of patrilineal ancestors represented by the lines above the local groups.

Figure 14 is, I think, a closer approximation of how the Sherqawa conceive of their own social identity.[117] The key points in the diagram are the four lower triangles, representing living or deceased men of prominence to whom clusters of persons claim ties through patrilineal descent, matrilateral or affinal ties, friendship, clientship, and residential propinquity. It is from claimed ties with such prominent persons that Moroccans usually begin to depict the individuals to whom they are “close” (H. Geertz 1974:45–47). The boundaries of these clusters are not sharply defined, signifying the ability of at least some persons to shift the components of their identity. The four lines of ascending

[[d-f-dale-f-eickelman-moroccan-islam-2.png][Figure 13. A segmentary model of social relations.]]

triangles indicate immediately preceding generations. These lines, A-D, are not connected on the diagram. To indicate the “closeness” of present-day clusters, Moroccans consider such ancestors to be brothers or construct some other plausible ties between them. When combined in use with the name-chains that I have discussed in this chapter, I think this model reasonably portrays how relations are conceived among the various Sherqawi descent groups (or, sociologically speaking, descent categories) in Boujad. The same basic model presented in Figure 14 can also be used to portray ideas of “closeness” in other Moroccan contexts (see H. Geertz 1974).

As I indicated in my discussion of “closeness” in rural and urban settings in Chapter 4, the key factor from a Moroccan point of view is to consider the gains of elaborating certain sets of ties instead of others. How these appraisals shift over time can be seen by returning to a specific consideration of the Sherqawa.

The latitude that Sherqawa have in asserting their own identity has enlarged as their firm identification with maraboutism has begun to crack. That separation has recently been willed by at least some of them. A century ago, the Sherqawa actively maintained their identity as a maraboutic descent group. Much more than today, the life-chances of individual Sherqawa and their clients depended on claims of “closeness” to a living Sherqawi lord. Both clients and other Sherqawa contracted ties of obligation (haqq) to marabouts and valued these ties much more than at present. Being a marabout was a desirable quality. Whatever their differences and rivalries, Sherqawa able to do so sought to achieve maraboutic reputations. Clients of marabouts valued association with such persons. Under present conditions, the political and economic significance of marabouts is decidedly more limited; active attempts to maintain a maraboutic reputation carry a highly negative value among educated Moroccans. The remaining clients of marabouts, still a majority of rural Moroccans, have downgraded their ties with them. Ties of obligation with marabouts, like all other social ties, are continuously revalorized in the light of current social realities.

A B C D

[[d-f-dale-f-eickelman-moroccan-islam-1.png][Figure 14. A Moroccan conception of

“closeness ”]]

“Sherqawiness,” what the Sherqawa assert their identity to be, has consequently undergone modifications. Sherqawi identity is still primarily associated with persons of prominence in the two main-line descent groups. Many Sherqawa now play down their identity with maraboutic ideology or assert that maraboutism constitutes only a residual component of their identity, maintained only by those ignorant of the “true” Islam. Popularly, especially among tribesmen, the identity of the Sherqawa with maraboutism still holds, so that material prosperity and largesse to pilgrims are direct measures of God’s grace. As one tribesman said, “You get greasy doughnuts from the Ghazawna [Sherqawa] but cous-cous from the ‘Arbawa. Of course the ‘Arbawa have more baraka\” In towns, the maraboutic basis for Sherqawi prominence no longer holds, although no sharp break has occurred with the past. The “religious” component of Sherqawi prestige is simply being redefined. For example, a wealthy merchant of the Ghazawna Sherqawa, now in his fifties, is one of the few Sherqawa to live outside of the medina in Boujad. He is opposed to maraboutism and has relinquished his right to a share in the offerings at the main shrine. To indicate his “progressive” orientation, he invites the men of his quarter to gather at his house each Friday afternoon, after mosque, to read with him the Qur’an and pious recitations (hizb-s) written by his ancestor, Sid 1-Ma‘ti (2–6). He emphasizes in his conduct what he considers to be the “proper” Sherqawi tradition, that of serving for centuries as exemplars of Muslim conduct and guardians of a scripturalist Islam. Despite this reformist orientation, many neighbors interpret his conduct in terms of his maraboutic antecedents. For this reason, not for the recitation of pious texts for their own sake, they regard the Friday meetings with him as particularly beneficial. Many other Sherqawa have made similar reinterpretations of their tradition. Even those who continue to engage actively in maraboutic activities often refer to them apologetically, at least to ethnographers, as a “trade” just like any other.

The contracting social bases of marabouts have had an impact on the ideology of maraboutism. Even the clients of marabouts are no longer able to take belief in them largely for granted. They are aware much more sharply than in the past that there are other conceptions of Islam in which there is no room for marabouts. This fragmentation of religious ideology and its confinement to a clearly defined sphere are by no means unique to Morocco. The fact that such a shift has occurred is less interesting sociologically than an analysis of how it took place. My concluding chapter is intended less as a microhistory of this transformation than as an attempt to discern temporal patterns in social and cultural change. The last three chapters have emphasized the symbolism of the social order as perceived by Moroccans. To a certain extent, Moroccan conceptions of the social order and the anthropologist’s analysis of it necessarily overlap. This convergence, however, can never be complete. The symbolic categories employed by Moroccans define the nature of the social order and serve as guides to the exigencies of social comportment. As I have indicated, Moroccans are not ordinarily conscious of the temporal shifts in these categories or in the elements of social reality which they define. Nor are Moroccans ordinarily concerned with comparing their own symbolic categories with those which exist in other societies or in comparing their understanding of Islam with that of Muslims elsewhere. The anthropologist is interested in such comparative, analytical activities, or at least in describing conceptions of the social order and comportment in it in such a way that such comparison is implicit.

** 8. From Center to Periphery: The Fragmentation of Maraboutism

At the risk of shocking sociologists, I should be inclined to say that it is their job to render social or historical content more intelligible than it was in the experience of those who lived it. All sociology is reconstruction that aspires to confer intelligibility on human existences which, like all human existences, are confused and obscure. (Aron 1970: 245)

*** Social Change: Periodization and Lived Experience

Ideally, historical periods are characterized by differences in the fundamental patterns of events which occur in them. Clearly, what constitutes a period depends largely upon the subject of inquiry. Periodization is necessarily an imposition of form upon the past, an attempt to comprehend and interpret meaning. It is important to keep this arbitrariness in mind, particularly in the study of processes of change. For one thing, periodization tends to emphasize the "core" characteristics of each period, so that successive ones are contrasted, with minimal reference to the transitions between them. Rather than emphasize the mechanisms of change, such an approach can lead to an overly abstract exercise in comparative statics in which only the fact that some form of change has taken place is salient. Another danger is an excessive zeal in locating temporal boundaries. Thus, the official French protectorate over Morocco began in 1912. Yet, as I have indicated, at least in western Morocco this event was merely a formalization of de facto control that had been exercised since 1907. From a retrospective viewpoint, the beginning of formal French control is unquestionably an important "marker" event and undoubtedly appeared so at the time to a few Moroccans directly connected with the central Makhzen. But in a hinterland region, such as Boujad, no such marker event stood out, especially since it took several months for the French to extend even the skeleton of administrative control to the upper Tadla Plain. Men perceived the emerging pattern of events in different ways. Some persons more than others had the talent to delineate these patterns and alter their conduct to take advantage of them. Some were simply in the right place at the right time. Others saw the wrong patterns and failed to adapt to events. The shading of periods into one another and the shifts of emphasis that occur within them are crucial to an understanding of how persons in a given society themselves perceive their social order, react to significant events, and ultimately, usually in a process imperceptible to themselves, alter or bring into question their cognitive maps of the cosmos and the social order.

To see how these shifts occur, I want, first, to sketch the main periods in the social history of Boujad and its hinterland over the last century. The last century has without question been one of accelerated social change, in the sense of significant patterns of events and opportunities succeeding one another more rapidly than at any prior time. This makes the processes of social and cultural change more visible than would otherwise be the case.

By employing a periodization keyed primarily to Boujad and its hinterland, I am not implying that it is possible to present a social history that is hermetically sealed off from "external" events, as was presumed by colonial ethnographers of earlier epochs. Still, the social history of Boujad was once much more contained than is presently the case. This remained true until the early 1930's. Among other reasons, the protectorate "froze" local notables into positions of authority as a means of securing its own legitimacy. For Boujad, this meant the Sherqawa. Morocco unquestionably had a national identity that permeated all elements of society. Nonetheless, the French were remarkably successful in maintaining and encouraging attention to local issues in most of rural Morocco through the 1930's. Beginning in that decade, though, Boujad's history ceases to be locally oriented. The town is increasingly swept into the vortex of national and even international events. Even for the

last few decades, however, there is an advantage in focusing on the effects of major political and economic shifts in a local setting. Moroccans, like members of any other society, interpret events and maintain their understanding of the social order primarily through interaction with significant others with whom they have ongoing, face-to-face relationships. Events elsewhere—wars, political decisions, economic opportunities—are interpreted in terms of their local consequences. A local study, such as this one, thus can place many events in a perspective more indicative of how Moroccans themselves experienced certain events than can more generalized accounts that focus only upon the activities of Morocco's national elite.

The periodization that I suggest here is meant to throw into relief transformations in popular religious beliefs. For this purpose, there are three significant periods into which Boujad's social history for the last century can be divided. The first is that of maraboutic hegemony, which characterized the preprotectorate period and lasted into the early years of the protectorate. In it, living marabouts continued to exercise a wide range of political, economic, and social roles. Sherqawa avidly competed to become marabouts and thought of their social honor primarily in terms of their alliances with maraboutic kinsmen. Because of the far-reaching political and supernatural consequences of clientship to marabouts, tribesmen placed a high value upon ties with them. The central Makhzen and, later, protectorate authorities recognized the importance attached to such ties and acted accordingly.

The second major period, which I have termed the Pax Gallica, lasted roughly from the inception of the protectorate (for this region of Morocco) through the Second World War. Throughout this period the French policy of maintaining existing notables in positions of authority was generally successful. Sherqawi marabouts were frozen into positions of prestige as local officials, but they no longer exercised political and economic functions as a consequence of being marabouts. Men in their maturity could remember when living marabouts had exercised a much wider range of functions but were aware, as were the marabouts themselves, that they no longer could do so. Younger persons, both Sherqawa and their clients, no longer had the personal experience of seeing marabouts exercise such roles. They could only be told about what marabouts had done. Moreover, after the establishment of the Pax Gallica, non-Sherqawi artisans and merchants no longer were dependent upon the Sherqawa for their well-being. These formed the core of adherents to forms of religious expression not directly associated with the Sherqawa and also constituted, together with younger, educated Sherqawa, the membership of the nascent nationalist movement from the 1930's onward.

The final period is that of the Second World War and its aftermath, during which France's hold over Morocco and its other colonies became increasingly fragile. More significant than this were the concomitant social and economic dislocations and opportunities generated by the war and the postwar economic boom. Sharp-eyed men able to grasp the realities of the new climate made fortunes in commercial enterprises and real estate. This shift was felt even by tribesmen, who were increasingly attracted by or pushed toward the alternatives of emigration to the coastal cities and military service. All of these transformations weakened the traditional social order which the French aspired to preserve in order to maintain their hegemony. Notables exercising formal governmental functions were somewhat handicapped in fully exploiting these opportunities, at least on the western plains, but urban merchants without such direct ties to the government were not. Also in this period, Moroccans who had been educated by the French came to maturity and, together with an older generation of traditionally educated scripturalists, openly began demanding independence for Morocco. Despite their continuing importance to rural tribesmen, marabouts no longer were capable of any significant political or religious

initiatives. Beginning in the 1930's, scripturalist nationalists began major attacks on maraboutism, attacking it much more, in fact, than they did the French. After the Second World War, maraboutism was no longer a significant issue. Nationalists had appropriated the powerful symbol of the monarchy, with its coalescence of Islamic and national identity, to legitimate their own movement.

Seen from a peripheral center, such as Boujad, independence in 1956 was less the start of a new era than the consolidation and legitimation of earlier de facto shifts of economic and political power. Local merchants quickly took over the enterprises of departing Europeans and Jews, and Moroccans assumed control of the country's administrative apparatus. From the vantage of a decade or so from now, the impact of the expansion of educational opportunities that accompanied independence will be more fully realized. Then, retrospectively, independence and the chain of events it set in motion may appear to be more of a sharp break with the past than now seems to be the case.

In each of the periods that I have described, certain categories of persons acquired prominence: marabouts; notables (including marabouts) recognized and sustained by the French; and an educated bourgeoisie adhering to a scripturalist nationalism. What was a meaningful assessment of the alignments of power and opportunity in one of these periods did not hold for the next, nor did a comportment successful in one period ensure a continuing prestige and adjustment to "the way things are" in the next.

Moroccans did not respond uniformly to the pattern of events characteristic of each of these periods; nor was there general agreement as to what constituted either dominant or emerging patterns. These events were differently evaluated, not only according to what Weber called the "class" situation of men and their location with respect to economic and political power, whether or not they were aware of it, but also with respect to how generations of men were temporally located in relation to one another. A generation of tribesmen with no personal experience of marabouts who exercised significant social and political roles responded to marabouts quite differently from tribesmen with such experience. However clear such shifts appear in retrospect, it is important to try to grasp these events as they were initially perceived by Moroccans who lived through them.

Karl Mannheim's 1928 essay, "The Problem of Generations"[118] (translated and reprinted 1952:276–320), remains one of the most comprehensive attempts to consider the effects of time on social institutions and cultural categories. I want to present some key aspects of his argument in order to use it to analyze the process by which maraboutism was relegated to a peripheral status in Morocco. Mannheim saw two earlier trends in efforts to view generations sociologically. One, which he associated primarily with Auguste Comte, was the "arithmetical mysticism" of positivists, who sought to develop "laws" of historical development based upon the biological life span of men and the fact that old and new generations continually overlap. Proponents of such "laws" asserted that, when properly developed, they would constitute universal, "natural" formulae of social and cultural change. A second tradition, associated primarily with Wilhelm Dilthey, saw generations primarily in relation to qualitative, "interior" senses of time not directly related (as with Comte) to quantitative considerations. Mannheim points out that this approach was less a fully articulated one than a reaction to the mathematical, unilinear concepts of development espoused by Comte and his followers (Mannheim 1952:281). Dilthey and others argued that generations develop not merely because of the chronological coexistence of persons, but also because they experience the same significant events in markedly similar ways. Thus time is not a pointlike event but one with multiple dimensions, always experienced by several generations at different stages of development (Mannheim

1952: 283).

To introduce the concept of the generation, Mannheim places it in the more general category of “social location,” the most familiar dimension being class. Individuals can be said to be located in a certain economic class or related in a certain way to the power structure of a given society regardless of whether they are conscious of it. A given class situation cuts individuals off from certain types of experience and exposes them to others. This holds equally, writes Mannheim, for membership in a generation. Those persons belonging to the same generation and similarly located in the social and historical process are thereby limited “to a specific range of potential experience, predisposing them for a certain characteristic mode of thought and experience, and a characteristic type of historically relevant action” (1952:291).

Generation location “is determined by the way in which certain patterns of experience and thought tend to be brought into existence by the natural data of the transition from one generation to another” (Mannheim 1952:292). This transition comes about through the continuous emergence of new participants in the sociohistorical process and the withdrawal of others, making for a continuous “fresh contact” with cultural traditions. Each generation has its own consciousness of these traditions. Their acquisition is composed of two elements. The first is that which is consciously or, more often, unconsciously appropriated from other persons. The second is tradition acquired by direct personal experience. The conscious and unconscious models on which men base their conception of the world and evaluate their actions are condensed out of their appropriated and personally acquired experience. The continual fresh contact with these traditions means that the cultural heritage is continually reinterpreted so as to maintain its meaning within the emerging realities of a given time and place. The changes brought about by this process are not necessarily apparent to participants in it. This is especially so for concepts basic to the social order, such as God’s will and obligations, and implicit patterns of religious belief, such as maraboutism.

As mentioned, time is not uniformly experienced by generations. Thus, one is “old” in so far as one “comes to live within a specific, individually acquired framework of usable past experience, so that every new experience has its form and its place largely marked out for it in advance” (Mannheim 1952:296). In youth, in contrast, such formative forces are just coming into being, so that basic attitudes are still being formed by the molding power of new situations. Significantly, these two groups influence each other, directly to some extent, but through intermediate generations as well. Contrary to the unilineal direction of change described by Comte, often the oldest generation is more capable than younger ones of flexibility in the face of new events and of realizing the potential of new perspectives engendered by the young.

Mannheim emphasizes that generation creates a similar “social location” (which he terms an “actual generation”) only to the extent that individuals “participate in the characteristic social and intellectual currents of their society and period, and in so far as they have an active or passive experience of the interactions of forces which [make] up the new situation” (1952:304). To adapt his argument to Morocco, it cannot always be assumed that tribesmen and townsmen of the same age belong to the same “actual” generation. In collecting genealogical data, for instance, I used Morocco’s independence in 1956 as a marker of calendrical time. For townspeople, this was a significant event, although it was often reinterpreted, especially by women, as “the commotion”—referring to the riots, demonstrations, house-burnings, and ensuing reprisals which had occurred in the late summer of the preceding year. For Sma‘la tribesmen, involved in an uprising against the

French in this period, independence was also a significant event. In contrast, independence as an event simply did not significantly impinge upon the personal experience of Bni Zemmur tribesmen, most of whom took no part in the events immediately preceding it. Hence for them, independence cannot be used as a temporal marker against which to plot other, more local experiences and events. The beginning of the protectorate constituted such a marker for them (“when the Christians came”), but its end did not.

Mannheim further divides actual generations into what he calls “generation-units.” These are “groups within the same actual generation which work up the material of their common experiences in different specific ways” (1952:304). Membership in a generationunit means acceptance of its characteristic values and, more importantly, “the ability to see things from its particular ‘aspect,’ to endow concepts with its particular shade of meaning.” It also entails absorbing certain “formative and interpretive principles” that enable individuals “to deal with new impressions and events in a fashion broadly pre-determined by the group” (1952:306). Such generationunits are not limited to concrete groups, although concrete groups in face-to-face relationships often form their nucleus (1952:307). Just as an ideology can spread beyond the confines of the class to which it initially appealed, so can formative principles peculiar to certain generations (1952:308). This is not to say that every generation evolves “its own, distinctive pattern of interpreting and influencing the world” (1952:310). Experiences which act as crystallizing agents to form distinct generation-units do not always occur. Also inherent in Mannheim’s approach is the idea that the “mentalities” unique to society at a given period do not entirely pervade it. Generation-units can put their intellectual stamp on coexisting groups without either destroying or absorbing them (1952:313). The clearest Moroccan example of this is the Islamic reformism of some of the urban bourgeoisie from the 1930’s onward. In relation to the total population, the carriers of this ideology represented a tightly knit but restricted minority of the urban population, but they can be seen retrospectively as “characteristic” of their period and exerting an influence well beyond their numbers. Although reformist Muslims were deeply antagonistic to it, maraboutism continued to survive as a significant force among Morocco’s rural majority, coexisting with reformist ideology.

*** The Pax Gallica and the Sherqaiva

I think it worthwhile to present the events immediately following the formal installation of the protectorate in greater detail than subsequent events. It was in the confusion of the early years of the protectorate that the Sherqawa, like the Moroccans elsewhere in Morocco, were compelled to make decisions that were to affect their fortunes for several decades.

The signing of the protectorate treaty of 30 March 1912 brought no immediate formal shift in the status of the Sherqawi zawya. Less than two weeks after the signing of the treaty, violent anti-French riots broke out in Fes and elsewhere. Their military suppression was the immediate concern of the French, so that for a few months the upper Tadla Plain was left to itself. Immediately after the protectorate treaty was signed, Sultan Mulay Hafed abdicated and was succeeded by his brother Mulay Yusef. News of this shift spread quickly throughout Morocco. But with no immediate pressure from the French to legitimate the new sultan and an aversion to making precipitate declarations of loyalty, neither the Sherqawa nor any of the tribes of the upper Tadla offered an oath of fealty (bay’d) to the new sultan.

Only by late summer of 1912 were the mechanisms of Makhzen legitimacy engaged on the

Tadla Plain, although in a somewhat confused fashion. In mid-August, Sultan Mulay Yusef sent a proclamation to the Zawya lord, Sid 1-Hajj Muhammed (2–10), notifying the “notables and qaid-s of the Bni Zemmur” of his enthronement and requesting their oath of fealty (E, 17 August 1912 / 4 Ramadan 1330). Shortly afterward, Hajj Muhammed’s sixteen-year-old son, ‘Abd 1-Qader (2–14), was sent to court bearing the oaths of the Tadla tribes and of the population of Boujad. Three weeks later, his visit was acknowledged in separate letters by the Grand Wezir, Muhammed 1-Moqri, and by H. Lyautey, who by this time had become resident-general of Morocco (both letters in E). The central Makhzen and presumably the French clearly were confused by the situation on the Tadla Plain. A few weeks after the proclamation sent to Hajj Muhammed, an identical one was sent to the rival ‘Arbawi lord, Sidi ‘Abdallah ben l-‘Arbi (2–13) (E, 5 September 1912 / 23 Ramadan 1330). The latter, of course, had been the “exclusive” lord of the Sherqawa in the eyes of the sultan’s immediate predecessor, but such niceties of legitimacy seem to have been quickly forgotten at the time.

By the autumn of 1912, the French had established Boujad as their first military outpost on the upper Tadla Plain. There was limited initial resistance from some of the tribes of the region, notably the Sma‘la, but in general military action was directed only to the south of the Umm er-Rbi‘ River. With the Sherqawi leaders and other notables, Lyautey was punctilious in his reassurances of all they had to gain by supporting France. Just as declarations of fealty were being extracted from the Tadla notables in late August, Lyautey wrote Hajj Muhammed to say that he was aware of the prestige of the Sherqawa and of their active role in aiding the French in the Shawya.

Lyautey defined his role to the marabout as one of collaborating with the Makhzen to bring order and peace to Morocco. Initially, Hajj Muhammed was frequently consulted on the selection of qaid-s^ as he had been in the past, and was often used as an intermediary to arrange for the submission of dissident groups. In turn, the French frequently intervened to “chastise” tribal groups (e.g., Bni Khiran) who menaced Sherqawi holdings in their territories. (Sherqawi estates outside of the Shawya were allowed at first to maintain their traditional prerogatives.)

By November, the French began to organize the formal administration of the Tadla. General Franchet d’Esperey came to Boujad on 12 November for this purpose.[119] He attended receptions given by both Sherqawi lords. Sidi ‘Abdallah ben l-‘Arbi and Sid 1-Hajj Muhammed. He claimed in the course of the day to have “reconciled” the two opposing factions so that henceforth only Hajj Muhammed was recognized as lord of the Sherqawa (Ecorcheville 1938:112–113; Cimetiere 1913:289; interviews with informants). The next morning, as “proof” of their settlement, both marabouts accompanied the general to Wad Zem, where he established a new military post. In actuality, both Sherqawi leaders recognized the danger of openly opposing French intentions or of allowing the French to interpret their internal rivalries as weakness.

The practical modalities of this “reconciliation” are not spelled out in detail, but one component was a division of influence between the rival Sherqawi factions. Hajj Muhammed advised on the selection of qaid-s over tribes in a client relation to him as marabout, including the Wlad Yunes (a subdivision of the Bni Smir), Wlad Bhar es-Sghir, and Gnadiz. He was also appointed qaid of Boujad. His brother, Hajj Hmed, became qaid over Bni Zemmur. Hajj Hmed was adamantly anti-French, refused to receive French officers at his house, and ignored French “suggestions” concerning his activities. Moreover, the tribesmen were hostile to having a Sherqawi as qaid. After a few months the French removed him from office.

Sidi ‘Abdallah ben l-‘Arbi of the ‘Arbawa was allowed to designate qaid-s for the Wlad Bhar le-Kbir, Mwalin Dendun, and Sma‘la, all groups that recognized him as marabout. A few years later he also became qadi of Boujad. This was considered at the time by both the French and the Sherqawa to be a much less important post than qaid. Within two decades this evaluation was to be reversed.

These first administrative arrangements were unsatisfactory to

Lyautey. He removed many of the Tadla qaid-s from office in April 1913, including the Sherqawi Hajj Hmed. In relation to the difficulties with the latter. Lyautey reminded his subordinate, Col. Emile Mangin, then responsible for the Tadla Plain, not to make formal appointments (or more exactly, not to arrange for the sultan to make appointments from among three nominees selected by the French) until an appointee had indicated his capacity to govern during a trial period of several months. Lyautey also insisted that each qaid should be chosen from the tribe over which he was placed. Moreover, the rural qaid-s of the upper Tadla Plain were deliberately selected for their independence from the Sherqawa.[120] Those of the Boujad region, as throughout Morocco, rapidly acquired personal fortunes through the formal and informal advantages attached to their positions. Throughout the periodic administrative reorganizations of the protectorate, essentially the same qaid-s, their brothers, and their sons retained hold over their offices. Later in the protectorate, some of these qaid-s had consolidated their positions to the point that they supported open attacks on the influence of leading Sherqawa. The French were not adverse to encouraging such local rivalries.

As for Boujad and the Sherqawa, Lyautey knew that Hajj Muhammed was dying (he died on 17 May 1913) and emphasized to Mangin the political importance of choosing an appropriate successor to “the bar aka.” Lyautey delegated Lt. Col. Emile Simon of Military Intelligence to discuss the situation with Mulay Yusef (Lyautey 1953:73, 83, 88–92). At this point, of course, French understandings of baraka began to be as important as those of Moroccans in determining maraboutic succession, since the French were in a position to impose their understandings of Moroccan society upon the social order and thus mold Moroccan social reality to fit their conceptions of it.

Hajj Muhammed was replaced by his son ‘Abd 1-Qader, regarded by both French and Boujadi-s as not particularly bright or skilled but, like his father, a “friend” of France.[121] As qaid, ‘Abd 1-Qader (he became a hajj in 1917) appointed primarily his Zawya kinsmen to subordinate posts. The nature of his office was such that he had many more patronage positions to offer than his ‘Arbawi rival, Qadi ‘Abdallah ben l-‘Arbi. Moreover, the posts over which the qaid had control rarely required literacy and so were open to a number of his supporters. Fewer subordinate positions were attached to the qadis court, and most of these required a high degree of literacy. Since only an estimated 1 or 2 percent of the population of the country was literate at the time, there was much less direct patronage that he could offer his relatives and clients. But Qadi ‘Abdallah and several other ‘Arbawi Sherqawa placed a high value upon traditional letters and, beginning in the mid-1920’s, upon French education, as it became locally available for younger Moroccans. Some ‘Arbawi Sherqawa sought out higher education elsewhere in Morocco. The Zawya Sherqawa primarily confined themselves to the immediate rewards of local posts. Until the last years of the protectorate, few of the Zawya Sherqawa were educated beyond primary school, which was locally available.

The French were aware of the continuing importance of mara- boutic activities to the Sherqawa but began actively to return the zawya to its “original” and “proper” concern with “spiritual” matters. In effect, this meant a quite untraditional separation of the “religious” from the secular activities of the marabouts. “Religious” activities were for the first time sharply set off from “nonreligious” ones. Of course, the two leading Sherqawi marabouts, as the qadi and qaid of Boujad, exercised the functions of these offices. But these, at least in principle, were limited to territorially circumscribed and formally defined administrative and judicial functions. Even the tribal clientele of these two marabouts soon sharply distinguished their maraboutic from their political and judicial authority.

The split of religious from political authority became more pronounced for the first few years of the protectorate, at least at the local level. The sultan, of course, continued to embody both spiritual and secular authority. In the first years, the French still used the Sherqawa as intermediaries to unsubmitted groups, but their role as intermediaries had been significantly transformed. No longer could the Sherqawa negotiate compromises. They could only indicate what were the terms of submission acceptable to the French. The standard French tactic for dealing with “dissident” groups was to strangle them economically by denying them access to their agricultural lands and their customary markets. As a result of this tactic, most tribesmen of the upper Tadla Plain, often on the basis of individual local communities, submitted to the French in late 1912 and 1913. The only exception to this monotonous pattern was a coordinated attack in early June 1913 by the Berber leaders Mha u Hammu ez-Zayyani and Mha u Se‘id on French positions in the Tadla. Mha u Hammu led an attack against the French post at Wad Zem, while Mha u

Seed’s tribesmen took up a position just south of Boujad. Colonel Mangin led the relief column for the French and was accompanied by the ‘Arbawi lord, Sidi ‘Abdallah, with whom most of the Sma‘la were in a client relation. Always punctilious in acknowledging services rendered, Lyautey later wrote to thank Sidi ‘Abdallah. One consequence of Mha u Hammu’s raid was that the trade route between Boujad and Khnifra was cut, although in July of that year Mha u Hammu sent his son to Boujad to negotiate its reopening. This was the last major incident in which the Sherqawa served as intermediaries.

After the above incident, the Sherqawi marabouts were effectively excluded from the scope of action considered by the French to be political. Thus the contingent supernatural curse (‘ar kbir) which marabouts had once been able to invoke to compel disputing tribes to cease hostilities could no longer be implemented, nor could the marabouts even collect offerings outside of Boujad without French consent; and, since both marabouts held official Makhzen posts, such permission was simply not granted. French policy was to discourage local officials from exercising influence beyond those territories for which they were specifically charged. There also was an intent, at least on the local level as opposed to the sultanate, to separate secular functions from those considered religious. Secular disputes were now the domain of the French, and they insisted on being informed of any outbreaks of violence. The French military negotiated settlements or imposed them by force. Tribesmen were aware that the French had pre-empted the Sherqawi marabouts (as well as marabouts elsewhere in rural Morocco) in the settlement of disputes. For a while, Sherqawi visitors were sought to mediate low-level quarrels, such as land disputes between tents or households. But, as antagonists realized that settlements could be appealed either to their qaid-s or to the French, even this contracted field of activity largely disappeared.

The Pax Gallica stimulated a political and economic differentiation that ostensibly maintained the “traditional” prestige of the Sherqawa but made it impossible for them to undertake the range of action upon which, in large part, they based their livelihood. Besides a developing oligarchy of autonomous rural qaid-s. a second important category of persons who became largely independent of the Sherqawa were Boujad’s merchants and craftsmen. After the effective imposition of French control, Sherqawi marabouts were no longer required to facilitate the safe passage of commerce in rural Morocco. It is also significant that, after 1912, most leading Sherqawa held local Makhzen sinecures. As a consequence of French policy, they were banned from simultaneous active participation in commerce and, on the double count of being marabouts and members of the Makhzen administration, were no longer able to secure patents of protection from foreign governments. Such patents, which exempted their holders from direct Makhzen (and after 1912, French) control, were invaluable for securing vital commercial networks in the Moroccan interior. The French and the Makhzen could act against patent holders only by registering a complaint with the European power that had granted the patent. Altogether eight key merchants in Boujad—six non-Sherqawi Muslims and two Jews—acquired such patents as local agents for major foreign trading firms.[122] Thus the protectorate gave non-Sherqawa (and by the 1920’s a few Sherqawa who had dissociated themselves from the activities of the zawya) a valuable competitive edge in commercial undertakings.

Changes in patterns of belief gradually followed the confinement of Sherqawi marabouts to narrower social roles and the growing economic and social differentiation of society. Prior to the protectorate, Sherqawi hegemony was such that any threat to Sherqawi interests on the upper Tadla Plain, and especially in Boujad, was not tolerated. Soon after the end of the European hostilities in 1918, one significant development throughout western Morocco was the rapid growth of urban religious brotherhoods (tariqa-s), especially the Kittaniya, Derqawa, Tijaniya, and Qadiriya. Each of these quickly established subsidiary lodges in Boujad and in the other, newer settlements that had appeared in the region. Outside of Boujad, the lodges connected with the eighteenth-century Sherqawi lord, Sid 1-Ma‘ti (2–6), also expanded rapidly, but in Boujad itself they acquired no significant membership. At first, however, most Boujadi-s maintained ties with the Sherqawa. As elderly townsmen explain, this was done out of a mixture of material interest and fear of the supernatural sanctions at the disposal of the Sherqawa. But the economic hegemony of the Sherqawa was curtailed with the protectorate; at the same time, the burgeoning of non-Sherqawi, urban-based brotherhoods provided alternative access to the supernatural.

The sudden growth of these urban brotherhoods can be seen as an expression of autonomy from Sherqawi marabouts. Adherents to these brotherhoods tended to make the same implicit assumptions about the desirability of using intermediaries to relate to the supernatural as were made by clients of the Sherqawa, but access to the supernatural was now more effectively differentiated. An increasing number of persons, primarily townsmen and elements of the rural elite, no longer felt themselves dependent on the Sherqawa or any other marabouts to ensure their well-being. The growth of these brotherhoods engendered no immediate ideological conflict with the Sherqawa, although the leaders of some of them fostered attempts to drive a wedge between the Sherqawa, who controlled the apparatus of the local government, and the French. The local mqaddem of the Tijaniya order repeatedly sent letters to the French accusing various Sherqawa of improper official conduct, and some of the charges were acted upon by the French. The French also suspected the leaders of two other brotherhoods of making anonymous denunciations of the Sherqawi qaid, qadi, and some of their kinsmen (B.31.BO, confidential, 23 November 1932; B.2261, 30 December 1934).

The principal adherents to these brotherhoods were non-Sherqawi town dwellers, primarily merchants and craftsmen, who had not belonged to such orders prior to the protectorate. The brotherhoods appealed to a relatively homogeneous bourgeoisie. The core membership of each tended to consist of the members of certain crafts or trades. None of the orders appears to have had any evangelical fervor in recruiting membership. When the national leader of a brotherhood, such as ʻAbd 1-Hayy Kittani of the Kittaniya order, came to Boujad, crowds of thousands, including tribesmen, flocked to the town. But few tribesmen subsequently joined his or any other order. It is significant that by this time Sherqawi marabouts no longer attempted to draw crowds in such a fashion.

Exact figures on local membership are not available in all instances, but by the late 1920's the Qadiriya brotherhood, not considered to be the largest in Boujad, had six hundred adherents in a population of eight thousand (B.10/BC, 23 February 1928). From the 1930's until just after the Second World War, their leader (mqaddem) was a merchant who had begun his trading activities prior to the protectorate but who had made his fortune by seizing the opportunities made by the French "pacification" of the region. Until the middle of the 1920's, he offered sacrifices at the conclusion of each weekly market at the shrine of Sidi Mhammed Sherqi in Boujad. Other merchants then began pressuring him to make contributions instead to the Qadiriya lodge, which he soon joined, to local mosques, and to other religious institutions not connected with Sherqawi marabouts.

The shifts in religious affiliations of the urban bourgeoisie affected only minimally the overall numerical support of the Sherqawa. Only a few tribesmen were attracted to these brotherhoods. These generally were clustered in certain local communities, and such adhesions were miniscule in relation to the overall rural population.[123] Still, the presence of an alternative to being a client of the Sherqawa meant that even tribesmen in Boujad's immediate hinterland no longer simply took for granted their ties with the Sherqawa. In the past, dissatisfaction with certain Sherqawa resulted in a shift of allegiance to other Sherqawi marabouts. Henceforth, a shift of allegiance away from the Sherqawa was a further, although rarely exercised, possibility. Yet the fact that such an alternative was consciously known to be available was in itself significant. In any case, by the 1920's, the Sherqawa were effectively stripped of their nonrural, nontribal clientele. Some townsmen made occasional offerings in times of personal crisis, but not the regular offerings characteristic of an earlier period. Moreover, those who made irregular personal offerings tended to be older rural immigrants who had all along maintained ties with Sherqawi marabouts. Younger rural immigrants tended more to drop these ties.

For the most part, tribesmen assiduously maintained ties with the Sherqawi marabouts[124] but were aware of their contracted utility. This was reflected in the offerings and sacrifices to the Sherqawa, which no longer flowed as freely as they once had. Diminished revenues meant that fewer Sherqawa were able to sustain themselves from the activities of the zawya. As offerings diminished, so did the services that marabouts performed for their clientele. At the same time, the formal and informal resources available to the two leading marabouts of the Sherqawa, the qaid and the qadi, effectively blocked the emergence of rivals.

The ideology and membership of urban religious brotherhoods, on the whole, constituted no overt ideological challenge to maraboutism. But the contracting of ties of obligation with shaykh-s of urban religious lodges was not simply a substitute for equivalent ties with the Sherqawa. The shaykh-s of urban lodges were more distant; their hegemony over the affairs of the Tadla Plain was not so multifaceted as that of the Sherqawa. However, a more pronounced revalorization of maraboutism emerged locally by

the 1920's and by the mid-1930's had acquired considerable momentum. This challenge came primarily from the Salafiyya, or Islamic reform movement, proponents of which I have often labeled as "scripturalists" in this study. Like their counterparts who emerged in the eastern Arab world in the late nineteenth century, Salafi Muslims argued that the Qur'an and the traditions of the Prophet were the only true bases of Islam, thus sharply distinguishing what they considered "true" Islam from the popular Sufism of urban religious brotherhoods and of maraboutism. Most of these reformists were traditionally educated urban bourgeoisie and were primarily situated in Morocco's largest cities, notably Fes and Marrakesh. Although their numbers were quite limited, their influence was considerable in such centers of Islamic learning as the Qarawiyin Mosque-University in Fes (where the Moroccan nationalist Allal al-Fasi was then an instructor) and its counterpart institution in Marrakesh, the Madrasa ben Yusef. From these institutions, the reformers had a considerable impact upon the urban bourgeoisie throughout Morocco and upon significant numbers of the urban proletariat in the larger cities.

The first Boujadi-s to be attracted to the reformist movement were several merchants in their mid-twenties who had attended one or the other of these centers of traditional religious learning. Boujad also was the forced residence from 1924 to 1934 of the Tunisian 'Amer ben Nefti ben Hajj Mansur bel Ghayb, who had a wealthy in-law in Boujad, also a Tunisian, who was a grain merchant. Ben Nefti was locally active in propagating his ideas and, although Boujadi-s today claim that his ideas did not strike a responsive chord among them, was expelled by the French on the omnibus protectorate charges of "doubtful morals" and "nationalist tendencies." Several other Moroccans in forced residence during the late 1920's and early 1930's also seem to have contributed to making elements of Boujad's bourgeoisie aware of alternative ideologies. The main activities of this loosely knit body of individuals in Boujad was to set up a series of ephemeral, ad hoc committees that, like similar groups elsewhere outside of Morocco's larger cities, confined themselves to negotiating with the local protectorate administration on the development of schools and other issues. In Boujad there were less than a hundred such persons, but these were very influential with other merchants and craftsmen of their generation. Membership in these committees tended to overlap considerably. In addition to negotiating with the French administration locally, these same committees in Boujad eventually established a "free school" in 1947, independent of the educational apparatus provided by the French. Elsewhere in Morocco, such schools began to appear in the 1920's (Damis 1973). Other activities included the establishment of an orphanage. The links set up by activists on these committees in the 1930's eventually formed the local nucleus for the nascent nationalist movement.

In Boujad, this movement initially attracted younger bourgeois merchants and craftsmen, many of whom had never, or only marginally, been involved in the urban religious brotherhoods that attracted an earlier generation of urban bourgeoisie. Nor had most of them ever been clients of Sherqawi marabouts. As I have mentioned, the membership of urban religious brotherhoods in the rural centers of the western plains consisted primarily of non-Sherqawa who had reached maturity when the Sherqawa as marabouts were still politically and economically influential. Recruitment into the brotherhoods flourished from the beginning of the protectorate until the late 1920's and then abruptly declined.

Later generations of the urban bourgeoisie, those who in Boujad joined or sympathized with the protonationalist movement, matured in significantly altered social and economic circumstances. Most had no personal experience of preprotectorate maraboutic hegemony. In larger cities, such as Fes and Sale, there existed a young, more militant French-educated intelligentsia (see Brown 1973), but such individuals were almost totally absent in Boujad,

where the nationalist movement remained dominated by men with a more traditional, scripturalist orientation. Especially after the Berber daher of 1930, there was a growing popular urban support for this protonationalist movement, primarily because of its emphasis on the purification of Islamic life and institutions and its resistance to what was popularly considered to be a French threat to Islam. As the movement became more politicized in the larger towns, there was a growing split between the politicized militants, concerned primarily with presenting demands to the protectorate administration, and the more traditional Muslim reformists, concerned more strictly with religious issues, such as mar- aboutism and, to a limited extent, the threat which the colonial regime posed to Islam. In Boujad, such a clear split never developed. In part this was due to the small number of such protonationalists and the limited range of action they could take. Negotiations undertaken with local French authorities were generally amicable;[125] attempts to discourage maraboutism almost never took the form of direct confrontation. After all, the merchants who formed the core of the protonationalist movement lived in daily contact with the Sherqawa. In the coastal cities, the nationalist concerns of the elite quickly spread to the growing urban proletariat, but in small interior towns, such as Boujad, they remained the concern of a limited cadre of educated bourgeoisie until the last years of the protectorate (Rezette 1955; Halstead 1967). Similarly, in larger urban settings it is necessary to provide finer distinctions among types of Islamic modernism and nationalism, such as are provided by Laroui (1974). In smaller centers, such as Boujad, such distinctions were jejune for all but a few educated persons until after the Second World War.[126]

Oblique attacks on the Sherqawa in the 1930's took the form of denunciations to the French controleur civile especially of official abuses of power, and the quiet persuasion of fellow townsmen to allow their support of maraboutism to lapse. In these actions the reformists were largely successful. No public meetings were involved, but reformist merchants employed subtle pressures within their personal networks of acquaintances, kinsmen, and clients. Significantly, these same neoorthodox reformists did little to carry their convictions to tribesmen associated with them. Many rationalized this neglect by saying that sustained attempts to disseminate reformist doctrines would have incurred the wrath of rural qaid-s and that tribesmen, in any case, were too "ignorant" to understand the significance of reformist doctrines. These rationalizations mask the inability of the reform-minded bourgeoisie to propagate their ideology in other milieus and their lack of interest in doing so. The various protean organizations which made up the nationalist movement did not, on the whole, begin active recruitment until the late 1940's.

Until the Second World War, the protectorate was fairly successful in cutting rural Morocco into a grid of impermeable sealed compartments, each with "its own life" and local identities (Montagne 1941:19). In each compartment, the French nurtured a local elite whose interests were articulated with those of the French. In the first few decades of the protectorate this policy worked remarkably well. In the Rousseauistic phrase of one early administrator, the "natural leaders" (Berriau 1918:4–5), that is, the existing local elite, were given positions in the local Makhzen administration or were designated as "notables" by local officers of the French administration. For a time such designation carried with it considerable advantages, including access to French education for the children of these individuals and a certain favored treatment in dealing with the administration. During this period the competition for influence and prestige among members of the rural elite was primarily focused upon the administrative zones established by the French. Most quarrels found their way into the office of the local controleur civil or Native Affairs officer. Local French officers often became arbiters as well as monitors of these disputes. In contrast to later periods of the protectorate, they were actively invited to play such roles. The monthly political reports for the early 1930's almost exclusively concern such local conflicts. Nationalist activities among the elite begin being reported for Boujad only in the

late 1940’s.

A valuable index of the patterns of influence which built up during this period is the official protectorate newspaper in Arabic, es-Sa ‘ada, to which all Moroccans considered notables by the French received free subscriptions. This newspaper meticulously recorded weddings and similar celebrations for all of the rural elite. Thus the wedding of one influential Boujadi in the late 1920’s was given front-page coverage in two successive issues, including a list of all notables who attended and the number of animals slaughtered for the feast. Such reporting is, of course, entirely absent from contemporary newspapers, which rarely go beyond a chronicle of movements of officials of the central government and sports events. This shift in emphasis accurately mirrors the shift in the loci of political power. The pattern of power prevailing during the protectorate contrasted sharply to that which existed prior to the protectorate, when Sherqawi lords intervened in a wide range of issues. In preprotectorate days local issues often were closely articulated with those of national importance. Likewise, the sultan and his entourage in those days closely followed the vicissitudes of tribal disputes and other matters which under the protectorate were considered to be of only local import. During the protectorate, there was formally no direct contact between local Moroccan officials and the central Makhzen. Such contacts as there were had to be made through the hierarchy of the protectorate administration.

*** Postwar Transformations and the Sherqawa

The position of local elites in Boujad was not entirely frozen, as was indicated by the patterns of growth of New Boujad from the 1930’s onward. Significant cracks in the hermetically sealed blocks into which the French had divided rural Morocco began to appear with the rise of the nationalist movement. This movement rapidly gained momentum with the economic and political opportunities and dislocations of the Second World War and the period immediately following. Fortunes were consolidated and broken, creating a significant gap between those who held formal positions of prestige and authority (local officials appointed by the French) and those who increasingly held real economic and political power.

The postwar years also saw a sudden resurgence of the sultan (by then popularly, if not officially, known under the more modern title of king) as an authority independent of the protectorate administration. Muhammed V used the Feast of the Throne (20 August) and other occasions to establish direct, personal contact with his qaid-s^ pasha-s, and other, nonofficial Moroccans of prominence. At the same time the palace took a somewhat more active part in the campaign against maraboutism. For the first time since the misadventurous antimaraboutic campaign of Sultan Mulay Sliman in the early nineteenth century, a reigning sultan was involved in a deliberate fight against saints and religious brotherhoods. As a symbolic gesture, the sultan ordered destroyed the shrines of marabouts in the vicinity of Ifrane, his summer residence in the Middle Atlas Mountains (Montagne 1953:217). No similar action was attempted elsewhere in Morocco, and there is no indication that the sultan’s move was meant to precipitate any widespread attacks on physical representations of maraboutism. The general attitude seems to have been one of encouraging a benign neglect of maraboutic ties, coupled with a rekindled strength in the religious and political symbolism of the monarchy.

Networks of nationalists in all parts of the country grew rapidly in the postwar period. At first, these were confined primarily to the urban bourgeoisie, but they were greatly

enlarged after the French deposition and exile of Muhammed V in 1953. Contrary to the claims of Boujadi nationalist leaders and the French (e.g., Montagne 1953), there is no indication that the “cells” of the nationalist movement were organized into well-defined, centrally directed hierarchies. The pattern that emerges both from interviews with local nationalists and from French reports of the interrogation of suspected nationalists suggests a more protean organization of personal ties.[127] Local leaders had clusters of supporters, with more casual clients at their periphery. In turn, local leaders had informal ties with leaders elsewhere in Morocco.[128] These were adept at using local antagonisms and quarrels to gain further support for the nationalist movement. Among tribesmen, nationalists stirred up resentment against Francophile qaid-s and promised the successful resolution of land quarrels and other disputes in exchange for political support (B, untitled document [a draft?] summarizing interrogations from 2 March to 31 July 1953) .[129]

In many ways the structure of these networks at the local level resembled that of ties to the Sherqawi zawya. The major difference was that efficacious political and economic power no longer was in the hands of the Sherqawi lodge or of those most associated with its activities. Marabouts continued to be regarded as significant by a majority of the population but were popularly recognized as peripheral to new patterns of economic and political action. By the early 1950’s some Sherqawa, especially those of the Zawya faction, which held the q aid-ship of Bouj ad and associated posts, found themselves locked in increasingly untenable positions, despite efforts to avoid action regarded as inimical by either the French or the nationalists (B: confidential report on qaid^ 21 January 1952). In the latter years of the protectorate, this descent group lost heavily in prestige. Just prior to the French deposition of Muhammed V in 1953, the aging marabout Qaid Sidi ben Dawd (2–15), went to Rabat and asked the sultan what stand he should take in the growing conflict between the French and the nationalists. “Go on as you have,” the sultan enigmatically replied. A close relative of the marabout present at the interview interpreted these remarks as justifying Sidi ben Dawd’s continuing as qaid^ which he did until his death in 1956.[130] The sultan’s words could also be interpreted as implying that nothing which Sidi ben Dawd could do either as qaid or as lord of the zawya would be of significance in the light of the contemporary political situation.

Another indication of the decline of the Zawya Sherqawa is the shifting pattern of marriage alliances of the leading households. Prior to the protectorate, central Makhzen officials, qaid-s of the western plains, wealthy merchants, and others sought such alliances. This pattern was sustained on a reduced scale in the first decades of the protectorate. By the 1940’s, such ties were no longer sought.

Predictably, the fortunes of the ‘Arbawi Sherqawa were just the reverse. Their position was progressively enhanced in the later years of the protectorate and after independence. Qadi-s, notaries, and other personnel attached to Islamic courts were relatively independent of direct French control. To be sure, the French had a decisive influence over appointments and had effected subtle but decisive modifications in the system of Islamic justice. But by and large the Islamic courts were autonomous, so that with independence in 1956 very few of the court personnel were removed from office. In the early part of the protectorate, most of the leading ‘Arbawi Sherqawa were associated with the courts and, as I mentioned, placed a much higher value on both traditional and French educations than did the Zawya Sherqawa. By the 1930’s and 1940’s, various ‘Arbawi Sherqawa were engaged in a range of activities. Some remained with the Islamic courts. Others left the sinecure provided by the French and engaged in commerce. One ‘Arbawi, for instance, began his career as a notary but spent most of his time judiciously

investing in agricultural estates in regions that the French began opening up to irrigation in the 1930's. After making a fortune in black-market operations during the Second World War, he plowed his profits into urban real estate in Casablanca, which quickly skyrocketed in value. Other 'Arbawi Sherqawa became active in nationalist politics and from the postwar years to the present have been strong supporters of the revitalized monarchy. Their traditional maraboutic prestige and its accompanying control of wealth and property have been successfully parlayed into other forms of activity that in the colonial and postcolonial setting have led to greater power, wealth, and social honor. For the more successful 'Arbawa, maraboutism is a thing of the past, appropriate to an earlier era but no longer cause for sustained Sherqawi prominence.

*** Conclusion

Patterns of social structure and the prevailing systems of meaning through which religious beliefs are expressed are not always isomorphic. Peter Berger has remarked that, seen historically, the relationship is often one of irony (1969:107). An ideology introduced because of a certain intrinsic logic for one social situation or status group often assumes, when adopted or reformulated in a new setting, implications far removed from those that were originally, consciously intended. A particularly dramatic instance of such a transformation seems to have occurred during the Maraboutic Crisis, as the carriers of popular Sufism found themselves regarded in a very different light and performing for the first time a wide range of critical political, social, and economic roles. The religious knowledge possessed by marabouts soon became popularly regarded as "secrets" transmitted in the patterns of "closeness" that I earlier described. North African maraboutism, like popular Sufism elsewhere in the Muslim world, sustained an implicit hierarchy between those to whom this knowledge was attributed and the remainder of society.

Sources for this earlier period are sufficient to indicate the broad dimensions of these transformations but provide little concrete evidence of the processes by which the contours of popular belief were modified. These are in much bolder relief for the last century. In the late nineteenth century, as today, a marabout had the reputation of being a particularly efficacious intermediary with the supernatural. There was no clear boundary between "spiritual" and "mundane" powers, so that marabouts had a wide range of action. Since God's will was, and is, thought to be revealed through this-worldly patterns of action, success in their multiple endeavors sustained the reputations of Sher- qawi marabouts and effectively handicapped the ascendancy of rivals. To secure the benefits of access to the supernatural, the clients of marabouts contracted ties of obligation to them that were sustained by the same underlying principles that governed all other ties in society and were evaluated just like these other ties.

The transformations in the ideology of maraboutism and of the social role of marabouts have been discussed at some length. What sort of orderly patterns can be found in these changes? Maraboutism, like any other belief, constantly affects and is affected by the political and economic realities in which men find themselves. It is important to keep in mind that belief systems are not free-floating Platonic entities. They are, as Peter Berger writes, "socially constructed and socially maintained. Their continuing reality ... depends on specific social processes" (1969:45). Such ideologies as maraboutism are neither captives to local social structures nor by-products to be mechanistically deduced from them. For at least four centuries, maraboutism represented a meaningful formulation of Islam for tribal and urban Moroccans. It has remained a significant component of social reality for some. But the ideology of maraboutism has been far from static. As a primarily

implicit, multivocal ideology, maraboutism owed its vitality to its flexibility in adapting to a number of varying situations. But the social conditions created by the protectorate, in Morocco at least, reduced the specific social processes which had maintained maraboutism throughout earlier centuries. This was especially the case in urban settings, where the transformations engendered by the protectorate were more pronounced than in rural areas and where alternative patterns of Islamic belief were ascendant and appeared to offer a superior formulation of "the way things are" in relations with the supernatural. Even among rural clientele, from the 1940's onward the spread of cash instead of animals and cereals as the principal medium in which offerings were made accelerated the conscious instrumental re-evaluation of the worth of these ties.

For most Moroccans, God continues to be the cause of everything and responsible for every turn of fate. But with the contracted sphere of influence of marabouts, there are now clear de facto boundaries on the intervention of the supernatural in the specific affairs of this world. With the disappearance of living marabouts, there is no concrete instrumental medium through which God's assistance can be invoked for specific situations.

The restriction of the roles that marabouts could play in Moroccan society was one component of a growing social differentiation made possible by the protectorate. There developed locally in the Boujad region a greater range of bases on which social honor could be established and power acquired. Nonmaraboutic elites developed that acquired considerable influence and prestige from commercial and political undertakings. These persons increasingly adopted and acted upon nonmaraboutic conceptions of Islam, locally an impracticable option in the preprotectorate era.

A Weberian sensitivity to the differentiation of interests and beliefs within a society is a more useful perspective in the study of the shifts in belief than are theoretical perspectives which emphasize (as do most Durkheimian studies of religious belief and practice) only those beliefs held in common by all elements of society. Thus, over the last century, the assumption that access to God is patterned on the relations which exist among men has appeared increasingly unrealistic to many Moroccans. Even many Sherqawa now play down the idea that their ancestors and certain of their living relations had a special relation with God. Instead, following the conventions of traditional Muslim historiography regarding marabouts, they maintain that the leading Sherqawa of the past were men like any others; the only difference was that they were distinguished for their piety, scholarship, and prestigious descent from 'Umar.

I have tried to show that this overall shift in meaning and social identity followed patterns discernible through time. An ahistorical study focusing upon contemporary patterns of belief without regard to their historical development would misrepresent the relationships of maraboutism with specific social categories. An equal distortion resuits from considering historical shifts only in superimposed synchronic slices. Although useful for some analytic purposes, periodization tends to blur the ongoing process of the reinterpretation of cultural traditions, particularly the interaction of different generation- units, to use Mannheim's term. Reinterpretations of Islam, or of other religions, do not follow as knee-jerk utilitarian reactions to changed economic and political situations, although such changes provide a heightened awareness of ideological commitment and thus provide a favorable climate for such re-evaluations.

The onset of the colonial period, particularly in urban settings, gave rise to a loss of orientation among many Moroccans and an effervescence of explicit ideological activity.

Much of this took the form of an increased receptivity to ideological currents in the Arab east, where Muslims had an earlier and in some cases protracted experience with the problems of foreign domination that now faced Morocco. The explicit ideological positions adopted by Moroccans were by no means unique to them (Laroui 1967). Nor was the contracted base of mara- boutism. Although still far from moribund, it lost much of its capacity to respond to new situations. In particular, maraboutism has not inevitably been replaced by reformist ideology, as accounts of these movements sometimes imply. Maraboutism continues to hold its ground among the majority of the population. The power attributed to individual marabouts has markedly declined, but maraboutism remains for many what Weber called the “religion of everyday life” (1968:416). Marabouts relate to the concrete life situations of their supporters in a way that the formal, egalitarian tenets of Islam cannot. Maraboutism implies a conception of the supernatural that is immediately present. It implicitly offers a degree of control over the unknown and the supernatural. Men contract and sustain dyadic bonds with marabouts by the same conventions that govern all other social interaction. The pervasiveness of this concept is apparent in the ties that many men, including some who formally denounce maraboutism, continue to sustain with marabouts. It also is apparent in popular interpretations of the symbolism that surrounds the Moroccan monarchy, in which the king is popularly seen as the vehicle for sustaining the country with baraka. In this light, the centralization of authority and de-emphasis upon primordial and regional loyalties that began during the protectorate and continued after independence have their counterpart in the popular religious symbolism of the monarchy. Its homology with the assumptions that govern the social universe is also, as I have sought to emphasize, the fatal weakness of maraboutism as an ideology.

A relatively small group of educated, generally well-to-do Boujadi-s (like similar Moroccans elsewhere) are activated by and committed to the explicit ideology of Islamic reformism. They interpret this reformist ideology as demanding the rejection of marabouts and of mar- aboutic ideology. Many more now say they subscribe to reformist tenets but continue quietly to act as if they believe in the efficacy of marabouts. The transcendent image of the divinity provided by Islamic reformism is in itself too alien from their experience of the realities of this world and the common-sense assumptions that guide their actions in it to carry conviction. This is so despite the fact that both in towns and in the countryside there is a resurgence of participation in formal Islamic rituals and observances. Awareness of this “official” Islam is undoubtedly stronger today than in the past.

In any major religious tradition, beliefs are responsive to social actualities. The two alternative conceptions in Islam of relations between man and God that I have illustrated here have allowed Moroccans, at least until now, to contain the impact of social change within the boundaries of the Islamic tradition. Thus a continuity of religious identity is sustained in the midst of altered social situations. The hierarchical conception of man-God relations represented by maraboutism is now in eclipse, but there is no reason to suppose that it will necessarily remain so. Islamic reformism, now ascendant, is selfconsciously less compromised by the social order. But Islam, like other major world religions, constantly must face anew cycles of compromise and noncompromise with the social order.

** Appendix: The Wheel of Fortune: The Last Maraboutic Intrigues

There are several compelling reasons to present in detail the struggle for the lordship of

the Sherqawi zawya that began in the mid-1890's. It was the last such major struggle to occur in a "traditional" setting. With the protectorate, the groups supporting aspirant marabouts contracted rapidly in size. A detailed account also checks the tendency to describe individuals in nascent factions as consciously striving to establish autonomous groups. The account presented here suggests, rather, that the process is one of heightened identity, in which the possibility of establishing an independent group emerges only gradually among the participants in such struggles.[131]

A mere enumeration of the sons of the major Sherqawi marabout of the nineteenth century, Sidi ben Dawd (2–8), suggests the problems inherent in maraboutic succession. At his death in 1889, he had twenty-one living sons. Whether their mothers were legal wives or concubines, technically all were equals in Islamic law. But in Sidi ben Dawd's and other major households, this legal precept failed to form a model for actual practice. The long lordship of Sidi ben Dawd meant that he was in a position to choose his successor. He was the last Sherqawi marabout for whom this was unequivocally true. The confusion

of events from his death to the beginning of the protectorate allowed none of his successors to establish a similar position.

In 1889, Sultan Mulay Hasan I confirmed Sid 1-Hajj l-'Arbi (2–9), the eldest of Sidi ben Dawd's sons, to succeed him. Sid l-'Arbi, then sixty-seven, had earlier spent many years in the sultan's entourage. Sidi 'Umar, his brother, continued to exert considerable influence as the "grey eminence" of the zawya. As mentioned earlier, 'Umar's son, Driss (d. 1915), had settled in Casablanca, where he operated as factotum with the Makhzen and merchants, arranging for the passage of caravans through Boujad and the Tadla Plain, and frequently provided detailed advice to his father on the position to take in negotiations with the sultan.[132] After 1904 he had become in addition an employee of the French consulate. In this capacity he advised the Sher- qawa, or those Sherqawa whose interests he represented, on how best to deal with the French. He performed much the same services for the French.

The Sherqawa wielded considerable influence in the 1890's. This is evidenced by Sid 1-Hajj l-'Arbi's assistance in getting the sultan's expedition (mehalla) safely from Dar weld Ziduh to 1-Bruj when Mulay Hasan I, accompanying the expedition, died in 1894. His death occurred in hostile territory. Had it been known to his entourage, they would have panicked and made likely a major crisis of succession, although the sultan had designated one of his sons, Mulay 'Abd l-'Aziz, as his successor. By keeping his death a secret for two days, until the return of the expedition to more secure territory, the sultan's chamberlain (hajeb) Ba Hmed was able to retain his power and secure the confirmation of Mulay 'Abd l-'Aziz (who reigned from 1894 to 1908), still a minor at the time. A proclamation reconfirming Sid 1-Hajj l-'Arbi as lord of the Sherqawa zawya was soon issued in the name of the new sultan (E, 26 August 1894 / 23 Safar 1312), but Ba Hmed, the Grand Wezir, Mehdi 1-Mnebhi, and others in the sultan's entourage had already begun seeking ways to undermine the strength of the Sherqawa (Ecorcheville 1938:89–90).[133]

From the beginning, Mulay 'Abd l-'Aziz's reign was marked by growing foreign threats and tribal uprisings. The Sherqawa were frequently called upon to negotiate with tribes on behalf of the Makhzen. Thus, when the Bhamna tribe rebelled upon the death of Mulay Hasan, they cut off Marrakesh from the rest of Morocco. Sid 1-Hajj l-'Arbi was sent to negotiate with them. A later royal decree (E, 27 July 1895 / 4 Safar 1313) congratulates the

lord upon his success and agrees to the terms for an amnesty which he negotiated. These included a t'argiba sacrifice, the traditional sign of submission, and the delivery to the Makhzen of the leader of the rebellion. In a face-saving compromise, the sultan acknowledged that, since the rebel leader had escaped, he was satisfied with the burning of the tents of the rebel and his followers and confiscation of their property, reported by the Sherqawi lord. Later, in 1898, the sultan camped near present Wad Zem for four months in an expedition intended to bring dissident tribal groups within the pale of the Makhzen.[134] Fifty-five heads were collected during this raid for display at Marrakesh. Again the Sherqawi lord served as the sultan's principal emissary. Despite their association with Makhzen interests, the Sherqawa preserved a measure of autonomy that some of the sultan's entourage found intolerable. Qaid-s fleeing the wrath of the Makhzen often successfully sought sanctuary in Boujad until favorable settlements could be negotiated. During this period there were also increased signs of tension between local qaid-s in Shawya and the Sherqawa.

From at least 1895 onward, the Makhzen directly subsidized a few descendants of Sidi ben Dawd who were not formally recognized by the Makhzen as being in control of the zawya. This act in itself signaled to ambitious Sherqawa the possibilities for intrigue among themselves. Subsidies were paid on feast days to the leader of this nascent faction, Sid 1-Hajj Muhammed (2–10), through the overseer (amiri) of customs in Casablanca. Hajj Muhammed wrote the sultan on each festive occasion, saying that he had invoked divine blessings on his behalf. He also specified to the sultan what he needed as a subsidy.

The core of the subsidized dissenters, who eventually became known as the Zawya Sherqawa, appear to have only gradually asserted a separate identity and acquired the resources to make this possible. Three months after the death of Sid 1-Hajj PArbi (2–9) (23 October 1898), one of his sons, Sid 1-Hajj 1-Hasan (2–11) was given "the direction of the zawya, to the exclusion of all other individuals, as was the case with your deceased father" (E, Sultan 'Abd l-'Aziz to Hajj 1-Hasan, 25 January 1899 / 13 Ramadan 1316). A second decree reaffirmed his leadership two years later, although its very issuance was indicative of the growing challenges to the new lord's position.

The split of the Zawya Sherqawa from the 'Arbawa formally culminated in 1901. The sultan ordered Hajj Muhammed (2–10) of the Zawya Sherqawa and his nephew, Sid 1-Hajj 1-Hasan (2–11) to his court at Marrakesh. There he announced that the zawya and all of its holdings were to be divided equally between them. They were henceforth to be known as its "co-lords."

The difficulties in dividing the Sherqawi holdings have already been discussed in Chapter 2. In general, Hajj 1-Hasan got control of the estates ^azib-s) to the south of Boujad and in regions peripheral to Makhzen control. Hajj Muhammed of the opposing Zawya group got the estates of Shawya and Tadla, regions at that time under relatively firm Makhzen control. To facilitate Hajj Muhammed's gaining control of his half of the lodge, Sid 1-Hajj 1-Hasan was detained for several months in Marrakesh. There he is reported to have said that the sultan should not be suspicious of his actions because he did not intend to remain lord of a zawya controlled by the Grand Wezir and the qaid-s of Shawya (Ecorcheville 1938:95).

The sultan's division of these estates only roughly coincided with the loyalties of tribal groups toward the two rival lords (see Table 7). Hajj 1-Hasan still was the more prestigious

of the two, despite the intention of the Makhzen to equalize their followings. When Hajj 1-Hasan finally was allowed to leave the sultan’s entourage (he did so from Rabat), he returned by way of the territories of several tribes which, at least a few years later, were clients of the rival Zawya lord: Zyadiya, Mdakra, Mzab, and Werdigha.

Neither Sherqawi lord took tribal alignments for granted. They were to fluctuate markedly, especially during the struggle for the sultanate which broke out in 1907. The agents of both lords actively canvassed tribesmen and Makhzen officials in the Shawya for their support.

These intrigues often flared into violence. In a decree dated 25 January 1903 / 25 Shawwal 1320 (E), Mulay ʻAbd l-ʻAziz ordered the qaid-s of Werdigha, Bni Zemmur, Ait Rbuʻ (near Qasba Tadla), Bni ʻAmir, and Bni Khiran to "respect" Sherqawa of the ʻArbawi descent group.

In general, Mulay ʻAbd l-ʻAziz endeavored to strengthen the position of Hajj Muhammed and his descent group, which never appears to have gained the stature of the ʻArbawi group. To dampen potential rivalries within his descent group, Hajj Muhammed secured a decree designating the elder of his two sons (2–14) as his deputy (E, 27 June 1903 / 1 Rbiʻa II1321). Since both sons were children, he relied primarily upon his brothers as emissaries to the Makhzen.

Correspondence for this period indicates that Hajj Muhammed was treated virtually as a servant of the Makhzen. As the French later became aware, much of his influence was based on his ability to secure Makhzen appointments for clients in exchange for whatever price the market would bear. For this privilege, the Makhzen held him responsible for nominating persons who could satisfactorily assert Makhzen interests. Essentially this meant the collection of taxes and settlement of all disputes inimical to Makhzen control. Hajj Muhammed was held responsible for the conduct of the qaid-s whom he nominated. Thus, when the Bni Musa refused to obey their qaid, appointed on the recommendation of Hajj Muhammed, the sultan wrote him: "You have informed us ... that the Bni Musa ask to have as their qaid the son of their old qaid in place of the present quid, Maʻti ben Ziduh. Maʻti ben Ziduh came with a letter from you and was named their qaid by your recommendation, while the son of the old qaid was named as his deputy" (E, 22 October 1904 / 12 Shaʻban 1322).

Despite its support of the Zawya Sherqawa, the Makhzen was aware of the strength of the ʻArbawi rivals and did not unnecessarily alienate them. When Sid 1-Hajj 1-Hasan of this faction died in 1903, the sultan named as his successor co-lord and as overseer of pious endowments his brother, Sidi Muhammed ben Sid l-ʻArbi ("Weld Zohra") (2–12) ,[135] bypassing his nineteen sons. When Weld Zohra complained about unfairness over the division of water rights of a subsidiary zawya which he jointly held with his rival, Hajj Muhammed (2–10), at the edge of the Berber highland near Bni Mellal, the sultan gave a courteous response and delegated the Berber qaid of the region, Mha u Seʻid, to look into the matter (E, 29 September 1905 / 29 Rejeb 1323). In general, neither faction appears to have gained a definite advantage over the other. This stalemate presumably was what the Makhzen intended. Until 1907, the policy was relatively successful.

By 1907, Mulay ʻAbd l-ʻAziz had become, in the eyes of many Moroccans, the creature of European, and especially French, interests. In an attempt to meet the threat of European intervention, the sultan undertook a series of well-intentioned but ill-conceived fiscal reforms which further weakened his position. Tribesmen believed that the sultan was losing his bar aka because of close contact with Europeans. In contrast, his brother Mulay Hafed owed his initial popularity to his being a symbol of resistance to European penetration. His supporters ranged from Fassi intellectuals, who saw an opportunity to undertake the same style of reforms as those desired by the "young Turks" for the Ottoman Empire, to tribesmen of such regions as the Shawya, who, for economic reasons (among which were new taxes considered to be non-Islamic), as well as religious and nationalistic ones, were increasingly disenchanted with the reign of Mulay ʻAbd l-ʻAziz.

Open conflict for the sultanate broke out when Mulay Hafed was proclaimed sultan by the ‘ulama of Marrakesh on 16 August 1907. The French used the occasion as a pretext to land troops in Casablanca later that month. Ostensibly this landing was to protect their interests in Casablanca and Shawya, but it was also intended to support Mulay ‘Abd l-‘Aziz. Nevertheless, Mulay Hafed steadily gained support, first from the tribes of the Marrakesh region and by December from the “ulama of Fes, led by Mulay le-Kbir le-Kittani of the powerful Kittaniya religious order. The Fassi support was conditional upon the insurgent sultan’s enacting certain reforms and undertaking to eliminate European influence over Morocco. Soon two leading Middle Atlas Berbers. Mha u Hammu ez-Zayyani and Mha u Se‘id, also joined the insurgent movement.

In the growing conflict it was difficult to maintain equivocal positions. From the point of view of the ‘Arbawi Sherqawa, in any case, nothing was to be gained by equivocation. For almost a decade the ‘Arbawa had been systematically undermined by Mulay ‘Abd l-‘Aziz and his entourage. Shortly after Mulay Hafed was declared sultan in Marrakesh, the lord of the ‘Arbawa, Weld Zohra, pledged allegiance to him. When in December 1907 a delegation of Fassi-s went to Marrakesh to see Mulay Hafed, they traveled with a Berber escort across the Middle Atlas Mountains; then across the Tadla and Sraghna plains they were personally escorted by the ‘Arbawi lord for part of the way (Ecorcheville 1938:100) .[136]

The Zawya Sherqawa were decidedly at a disadvantage because of their close ties with Mulay ‘Abd l-‘Aziz. Nevertheless, Sid 1-Hajj Muhammed (2–10) wrote to Mulay Hafed, imputing to him long-standing ties with the Sherqawa. Mulay Hafed replied to this attempt at alliance-hedging, thanking the Zawya lord for his sentiments but not revealing his intentions toward him (E, 26 December 1907 / 21 Qa‘ada 1325).

‘Arbawi support for Mulay Hafed was rewarded in 1908. Mulay Hafed issued a decree naming Muhammed “Weld Zohra” as the “sole” lord of the zawya and authorizing him to secure all prior royal decrees concerning Sherqawi matters from his relatives (E, 6 April 1908 / 4 Rbi‘a 11326). The wording of the decree suggests its entrepreneurial nature, since Mulay Hafed and his advisors do not seem to have had a clear idea of just what were the Sherqawi prerogatives. Shortly afterward Mulay Hafed ordered Hajj Muhammed (2–10), along with the “qaid-s, notables, and council” of the Bni Musa and Bni ‘Amir, to his court (E, two identical proclamations sent to the two tribes, dated 23 April 1908 / 21 Rbi‘a 11326). Both tribes were already supporters of Mulay Hafed. Predictably, although the sultan assured Hajj Muhammed that he had “absolutely nothing to fear,” the latter never left Boujad.

Mulay ‘Abd l-‘Aziz rapidly lost support on the Tadla Plain. In April 1908 he asked the Bni Khiran to furnish him with horsemen for an expedition. A few days later he made a similar request to the Wer- digha that indicated the weakness of his position: “We are aware that you followed Mulay Hafed against your will. You did not have the necessary strength to resist him. For this reason we accord you complete pardon” (E, 1 May 1908 / 29 Rbi‘a 11326). There no longer were the customary menaces of retribution.

From their arrival in Casablanca, the French military carefully monitored the local political situation of the Shawya and, ostensibly only to protect the Shawya, the neighboring regions. Since Driss ben ‘Umar of the Zawya Sherqawa worked for them, the French tended for years to underestimate the importance of the rival ‘Arbawi faction. Moreover,

the French presumed a notion of marabou tic legitimacy in which only one person could be recognized as lord of the zawya at any given moment, so that rivals were dismissed by them as “malcontents.” Even after the French established a forward intelligence post at Ben Hmed in the Shawya in late April 1908, to provide them with better intelligence on the Tadla Plain, they did not alter their assessment.

Mulay Hafed passed through the Tadla Plain in May 1908 to consolidate support there.[137] Throughout this visit he was accompanied by Hajj Qaddur, a brother of the lord of the ʻArbawa. By the early summer, most of the tribesmen of Werdigha and Bni Khiran had shifted their support to Mulay Hafed. Moreover, Weld Zohra of the ʻArbawa gained the reputation of being Mulay Hafed’s political agent for the Tadla Plain. Anyone who wanted access to Mulay Hafed (or his powerful ally, Qaid l-ʻAyyadi of Rhamna) first had to speak with the lord of the ʻArbawa.

Two parallel administrative structures developed in this period, each supported by one of the Sherqawi lords and his clients. Hajj Muhammed of the Zawya Sherqawa counted on the support of tribal qaid-s who owed their posts to him. The lord of the ʻArbawa arranged for rival qaid-s to be appointed by Mulay Hafed. Thus in Bni Brahim (Bni Musa), an unpopular qaid had been appointed on the advice of Hajj Muhammed. The ʻArbawi lord arranged for appointment of a rival Hafedist qaid, more acceptable to the tribesmen. Similar tactics were employed on a section-to-section basis.

Despite the weakened position of the supporters of Mulay ʻAbd l-ʻAziz and consequently of the Zawya Sherqawa, Hajj Muhammed was still considered by the French to be the “legitimate” Sherqawi marabout. When the French undertook a major reorganization of the qaid system in Shawya, they at least formally sought Hajj Muhammed’s advice. The French were informed (by Driss?) that the Sherqawa were “traditionally” consulted in such appointments. The French were aware, however, that in consulting the Sherqawi lord, they served only to augment his prestige. On these grounds Lieutenant Colonel Fretay of Military Intelligence advised in late July against the appointment of Hajj Muhammed’s nominee for qaid over the Mzab and ʻAshash tribes, especially since the appointment would not strengthen Mulay ʻAbd l-ʻAziz or the French (JP, 29 July 1908).

Fretay was also concerned with the “ambiguous” attitude of Hajj Muhammed toward French interests.

In November 1908 Paul Marty, then an officer in Military Intelligence,[138] was sent to Boujad to report firsthand on the political situation. The timing of his visit and substance of his report suggest that his main purpose was to sound out the Sherqawa on the consequences of the imminent shift of French support to Mulay Hafed. Marty, although aware of dissent, remained convinced of Hajj Muhammed’s dominant position: “Everywhere the natives show signs of the highest veneration for him, listening to his advice and following his orders. Nevertheless, he has enemies. At the moment, the malcontents and ambitious of each tribe gather around his nephew, “Weld Zohra” Ismaʻil. The Smaʻla have always been troublesome to him” (Marty in JP, 1908). While in Boujad, Marty stayed at the house of Hajj Muhammed. A day after his arrival, what he termed an “anti-French” demonstration occurred in front of Hajj Muhammed’s house, intended to show the “lack of authority” of the Zawya lord. Hajj Muhammed’s response was to order the notables of each quarter to call on Marty and express their lack of hostility toward

France. Marty conceived of the Sherqawi position as follows: “[The ʻArbawi] faction [parti] relies on Berbers from outside [the region]: the Zayyani, Mha u Hammu and the Wirrani, Mha u Seʻid. Some statements of the Zayyani have particularly instilled a certain fear in [Hajj Muhammed] . [Mha u Hammu] said that after the harvests he was going to destroy Boujad ... [Hajj Muhammed] asks that the French come to his aid in such a case.... I made a dilatory reply and promised to relay his request” (Marty in JP, November 1908). Hajj Muhammed seemed most concerned with securing from the French their guarantee that his interests would remain secure whatever the outcome of Makhzen politics:

The Sid has marked sentiments for ʻAbd l-ʻAziz. He concluded by telling me that whichever Sultan France might recognize in Morocco, he avidly hopes that [a guarantee of his status] will be included in the conditions imposed on the new Sultan so that he will be maintained with all the advantages of his situation.... He is against all Makhzen intervention in the affairs of Boujad as well as in the estates [fermes] which he possesses in the exterior:

Shawya, Dukkala, etc. This question is very important to him and I believe that he will soon come personally ... to Casablanca [to discuss it]. (Marty in JP, November 1908)

Shortly after Marty’s visit, the French issued a patent of protection to Hajj Muhammed which exempted him from direct Makhzen administration.

Mulay ʻAbd 1-Aziz’s position rapidly crumbled. Not long after Marty’s visit, Hajj Muhammed wrote General d’Amade, commander of French forces in Casablanca, asking what position to take. The general replied on 8 December, announcing that Mulay ʻAbd 1-Aziz had abdicated and had been replaced by Mulay Hafed. He advised the Sherqawi lord that his animals, clients, and other interests would be protected. “Do not worry about news from the outside. If anyone tells you to rebel, do nothing.” He was further assured that “mutual friends” had intervened to make the new sultan “forget” Hajj Muhammed’s support of ʻAbd l-ʻAziz (Ecorcheville 1938:105).

The sudden abdication of Mulay ʻAbd l-ʻAziz and reversal of the French position did not bring an end to internal conflict. Moreover, many Moroccan clients of the French were caught in an untenable position. The Journal Politique of May 1909 acknowledges that when the French were “led” to the support of Mulay Hafed, they advised qaid-s and others “in contact with them” to shift their support to Mulay Hafed. The French recognized, however, that there was little they could do to ease the precarious situation of those who, at French insistence, had earlier supported ʻAbd l-ʻAziz. Hajj Muhammed was commended for his “Francophile sentiments” (writers of other reports assessed his sentiments less favorably) but was recognized as one such loser (JP, Sicard, May 1909).

Clashes between the supporters of the two sultans did not cease. From the summer of 1909 onward, “anarchy” and “banditry,” to use the terms of the French reports, were on the rise. Significantly, the reported upsurge of “anarchy” coincided with a growing desire of the French military to intervene directly in the affairs of the Tadla Plain. Throughout this period, Hajj Muhammed continued to be useful in quelling tribal disputes. At the end of 1909, Hajj Muhammed combined a visit to the French outpost at Ben Hmed with a

collection of offerings from various Shawya tribes. In the course of these rounds, he arranged for a truce (sulh) between the ʻAzizist and Hafedist factions of the important Bni Smir tribe by collecting fines from both groups. Two weeks later, on 12 January 1910, he returned to the French outpost accompanied by his brother, Sidi Muhammed Sultan, who was at that time qaid of Werdigha. Muhammed Sultan requested the French to exempt both the Sherqawa and their clients from corvee labor. The French were aware that his intention, although clothed in the argument of "tradition," was to increase the strength of his own clientele by offering significant material advantages to his supporters. The French replied that they had done all they could to maintain or enhance the marabout's interests. Such demands, together with French awareness that the marabout was still influential but less than fully committed, or essential, to them, made at least one officer suggest that it would be in the French interest to confine marabouts to strictly "religious" affairs. The ensuing de facto separation of social roles initiated a chain of events which encouraged a similar differentiation in the realm of ideas, as I have argued. Ironically, the disturbances caused by the French occupation of the western plains and the struggle for the sultanate left virtually nothing of what the French considered the "spiritual" aspect of the zawya. The school (madrasa) of the zawya was irremediably crippled by the disturbances leading up to the protectorate. The Sherqawi marabouts, sensing no doubt the changed social circumstances, no longer showed any overt concern over its fate (Cimetiere 1913).

By 1910 the French had consolidated their hold over the Shawya. The urban and rural elites of Morocco began clearly to realize that the French were significantly altering the rules of the game of political entrepreneurship in Morocco. Local centers of influence and prestige could still be maintained, but only through alliance with the French. An early French innovation was the requirement that marabouts, including the Sherqawa, obtain French authorization to make the rounds of tribesmen to collect their "rights," or offerings. Thus in 1910 Hajj Muhammed was allowed to visit Wlad Seʻid, Mzamza, Gdana, and Wlad Bu Ziri client tribes located in the French-controlled Shawya. The French were not entirely pleased with his ensuing conduct. The Journal Politique (January-February 1910) reports that he spread "alarmist rumors," among which were that the French had renounced the idea of further extension of their influence and that yet another change of regime was to be expected. However, the French were aware that Hajj Muhammed was still influential among the tribes. In any case, he remained a significant conduit of intelligence regarding tribal politics on the Tadla Plain.

Another indication of changed circumstances was the constant stream of letters between Driss ben ʻUmar and Hajj Muhammed, arranging frequent visits of the Zawya lord with the French "ambassador" (bashador\ consul, and military officers. The principal concern of the Sherqawa in these visits was to maintain or extend their privileges in the Shawya. In a letter written early in April 1910,[139] Driss asked one of his brothers in Boujad to gather all royal decrees held by the descendants of Sidi ben Dawd (2–8)—in other words, those held by both the Zawya and the ʻArbawi Sherqawa. Driss mentions those individuals most likely to possess them, an indication of how little communication there was between the two factions, and promises their timely return. What was at issue, he wrote his brother, was the status of all Sherqawi ʻazib-s in the Shawya, but he asked that this be concealed from other Sherqawa. On 9 April, Hajj Muhammed was summoned to Ben Hmed to discuss the matter with the French. A second meeting took place a week later at Qasba 1-Mzab. On both occasions the Sherqawi lord unsuccessfully attempted to convince the French of "traditional" Sherqawi prerogatives. Sherqawi ʻazib-s were stripped of their special status. Their inhabitants, Sherqawa and non-Sherqawa alike, became subject to taxes, corvee labor, and direct Makhzen administration. Late in 1910, another major administrative reorganization was

made in the Shawya. In it, the French reduced substantially the number of qaid-s and shaykh-s and stipulated that henceforth such officials would be drawn exclusively from the groups over which they had authority. The Sherqawa were no longer to be consulted over the nomination of officials in Shawya, although their advice was still sought for the upper Tadla Plain as late as 1913. Alarmed by the exclusion of Sherqawa from Shawya affairs, Driss ben ‘Umar wrote Hajj Muhammed (S, January 1911 / Mu- harrem 1329), suggesting that he oppose the French move. Driss also asked to be sent a list of Hajj Muhammed’s nominees for the qaid- ships, together with their tribal origin and any information useful in maintaining Sherqawi influence. His efforts were unsuccessful.

Ostensible concern for the security of the Shawya led the French military to extend their activities to the Tadla Plain, although their instructions from Paris expressly forbade such action. The military’s justification for the ensuing expeditions was that the marabout Ma l-‘Aynin, who had effectively organized resistance against the French in Morocco’s far south, had come to the Tadla Plain for the same purpose. His presence seems to have been conjured by the military, since intelligence reports for the period, usually precise in their documentation, provide no specific accounts of the marabout’s activities. There were, however, other “agitators.” The advantage to the French military of asserting Ma l-‘Aynin’s presence was that he was recognized as a formidable threat in ministerial and parliamentary circles in Paris, whereas the other “agitators” were not. Nonetheless, the raids organized by these “agitators” into regions nominally protected by the French suggested to many tribesmen that the French hold was tenuous. For this reason the military was anxious to stop them.

The French launched what was meant to have been, at least to the metropolitan authorities and the parliament, a secret punitive expedition. One column, composed largely of Senegalese troops under Commandant Aubert (the French often practiced the economy of using colonial troops to maintain their empire), left from Ben Hmed in the north and proceeded through Boujad, Qasba Tadla, and the “dissident” regions of Bni Musa and Bni ‘Amir. A second column proceeded from the south of the Shawya. When Aubert reached Boujad, Hajj Muhammed was asked to accompany the column in order to minimize resistance. Aubert clearly was under the assumption that a marabout had “authority” over his tribal clients. The Sherqawa had probably encouraged, or at least had not corrected, this assumption during their earlier attempts to maintain a voice in the political affairs of the Shawya. The assumption was now put to an empirical test.

Fearing stiff resistance to the French, Hajj Muhammed pleaded illness and instead substituted a kinsman “with no prestige or authority” (JP, D.14, June 1910). When tribesmen in the Qasba Tadla region later offered only token resistance, Hajj Muhammed quickly joined the column in an effort to take credit for this. But he refused to accompany the column to the Bni ‘Amir. At this point, Hajj Muhammed told Aubert that he had absolutely no prestige among that tribe and asked that the ‘Arbawi lord, Muhammed “Weld Zohra” (2–12), be asked instead. Aubert attributed Hajj Muhammed’s refusal not to the structural position of the marabout, which did not include the exercise of formal, political authority, but to a lack of character: “Without attaching more importance than deserved to the charges of his enemies, who portray him as playing a double game, one is led rapidly to the belief that this religious figure wavers above all through impotence and that his pusillanimity renders him incapable not only of leading a popular movement, but even of forseeing it” (JP, D.14, June 1910). The French possessed earlier accounts that the “malcontent” ‘Arbawi lord had a sizable following, but only one report (JP, D.20, Sicard, May 1909) correctly perceived that there were actually two “legitimate” marabouts in the eyes of the Moroccans. Weld Zohra was summoned from Boujad and quickly joined Aubert’s

column. There was an element of surprise in his acceptance, for the French had been led to assume by the Zawya Sherqawa that Weld Zohra was implacably anti-French. Aubert wrote that, as the column progressed. Weld Zohra successfully “reduced fanaticism.” However, a fatally hostile assembly of tribesmen was waiting for the column among the Wlad ʻAyyad of Bni Musa. Among the tribesmen there were reportedly some Ait ʻAtta from the High Atlas Mountains. The marabout tried to “reduce the fanaticism of the crowd, some of whom accused the Sherqawa of having sold Shawya to the French and of trying to do the same with Bni ʻAmir and Bni Musa!” A shot was fired, which killed the marabout.[140] Regard for his maraboutic baraka was restored immediately upon his death. Tribesmen fought over his remains in order to bury him, or part of him, on their own lands, but the lord’s retainers managed to regain possession of the corpse and return it to Boujad. Weld Zohra was posthumously awarded the French Legion of Honor for his services (JP, Aubert, June 1910).

None of these events mitigated the hostility between the ʻArbawi and Zawya Sherqawa. When he learned of Weld Zohra’s death, Driss ben ʻUmar, in Casablanca, felt compelled to write to his uncle Hajj Muhammed that it would be “reasonable” (^aqil) for him to present condolences to prominent ʻArbawa. That such a letter was even sent indicates the prevalent antagonism. Driss presumably was motivated not only by propriety but also out of concern for the image of the Zawya leaders in the eyes of the French.

Mulay Hafed waited for over ten months before appointing a successor to Weld Zohra. Finally, on 30 April 1911 / 1 Jumada I 1328, he issued three proclamations naming Sidi ʻAbdallah ben l-ʻArbi (2–13) as the “exclusive” lord of the Sherqawa and assigning all Sherqawi estates to him (E). Despite Weld Zohra’s sacrifice for France and the Makhzen’s appointment of an ʻArbawi as lord, the French continued to assume that Hajj Muhammed was the only “legitimate” Sherqawi lord. By now, however, the French were in a position to impose their definition of realities upon Moroccans, and their disregard for the action of the Makhzen was evidently not successfully contested.

Rather than mitigate hostile raids, the indecisive French action served only to exacerbate them. For one thing, marabouts and what the French called “war chiefs” were able to rally many tribesmen in a holy war (jihad) in the defense of Islam. The internal organization of these raiding parties has been discussed in Chapter 4. Unfortunately, the French reports give only terse, inconclusive comments on their ideological component. Another motivation to join antiFrench raids was the fear of falling under Makhzen authority. The French were aware that anti-French resistance in Dukkala, for instance, was tenacious because of the heavy-handed rapacity of Qaid l-ʻAyyadi of the Rhamna, one of the “grand qaid-s” on whom the French were soon to rely for control of the south (JP, Col. Brauliere, September 1910). They were also aware, however, that the leaders of some raids seemed motivated only to demonstrate their importance to the French. Thus, a marabout from the zawya of Taneghmelt (Ntifa), Sidi Hmed ben ʻAbbas, acquired a significant following on the southern Tadla and began raiding tribes that had submitted to the French. Through the intermediary of a qaid in Sraghna “friendly” to the French, he suggested that his neutrality could be purchased (JP, December 1910).

These raids continued throughout the summer and fall of 1910 and the following year. The Sherqawa used them as an opportunity to demonstrate to the French their ability to monitor and settle the tribal disputes of the Tadla Plain. At French request, the lord of the Zawya Sherqawa regularly undertook the settlement of disputes (e.g., S, Driss ben ʻUmar to Hajj Muhammed, 8 July 1910 / 29 Jumada II 1328). The ʻArbawi Sherqawa also tried to

gain French attention in this manner. Thus in November 1910 Sidi Sherqi ben l-‘Arbi Sherqawi, later to become overseer of pious endowments for the Tadla and Bni ‘Amir plains under the protectorate, wrote General Monier and described the great expense he had incurred in arranging for the disbanding of the raiding party of Shaykh Mha l-‘Attawi.[141] The French recompensed him, although they were skeptical of his influence in halting Shaykh Mha’s activities. Sidi Sherqi was unsuccessful in attracting a following in the winter of 1911. At least some of the French were aware of the cyclical patterns of raids, which diminished rapidly with fall planting and did not resume again until after the harvests. In the fall of 1910 the French received numerous tribal delegations seeking protection from these raiders (and presumably also from the French). Some French interpreted these delegations as a sign of their growing influence, although others were aware of the vulnerability of tribesmen to French threats during fall planting.

In general, the French were unimpressed with the ephemeral truces arranged by marabouts. For instance, Hajj Muhammed was often unsuccessful in arranging lasting settlements. He also reported to the French that a deputation of tribesmen from Werdigha, Bni Khiran, Sma‘la, and Bni Zemmur had asked him what attitude to take with Shaykh Mha and another anti-French “agitator.” The anonymous writer in the Journal Politique remarks that the marabout “prudently” advised them not to attack the French (JP, April- May 1911). Earlier, the Journal complained of the “shady” (louche) attitude of the marabouts of Boujad and of another zawya in Dukkala, because maraboutic loyalties shifted with their perception of the strength of the antagonists. The writer was particularly concerned with the Dukkali marabout, Sidi Ahmed Tunsi, who maintained a contingent of horsemen with orders to join the winning side of any dispute in order to carry away a share of the booty (JP, December 1910).

After the summer of 1911, the French report only minor conflicts on the Tadla Plain. The reporting for this period, however, is also rather thin, reflecting the transfer of French attention to the Fes region where, by the end of the year, five thousand troops were camped outside the walls of the palace. Having eliminated the last international obstacles to their protectorate in November, the French began in earnest to prepare for colonial rule. Henceforth, the Sherqawa were to play only a minor role in their calculations.

** Glossary

‘alem (pl., ‘ulama): religious scholar.

annexe. See melhaqa.

‘ar. conditional supernatural curse or compulsion.

‘Arbawi Sherqawa: one of the two most prominent descent groups of the Sherqawa.

‘ashur-. tithe; in preprotectorate Morocco the term also signified a

government tax or, with the consent of the sultan, a payment made to a designated marabout in lieu of a tax.

‘azib\ estate granted to marabouts by the preprotectorate Makhzen that was exempt from direct government taxes and controls.

baccalaureat’. degree granted upon the successful completion of six years of secondary studies in France and Morocco.

baraka-. supernatural blessing; abundance.

bay’a: oath or covenant of allegiance to a king or marabout.

Boujadi: person from Boujad.

cercle. See da’ira.

college’, school providing the first three years of the six-year cycle of secondary education in France and Morocco.

controleur civil’. French official in charge of a cercle (da’ira); the lowest rank in the French Native Affairs administration in protectorate Morocco.

daher: royal decree or proclamation.

da’ira (Fr. cercle): ordinarily the smallest unit in Moroccan administration, over which a qaid is placed.

dawwar: rural local community (lit., “circle”).

derb: an urban quarter, in western Morocco (in Fes the term merely signifies an alleyway or impasse).

fabor: gratuitous act thought to require no reciprocation.

Fassi: person from Fes.

foqra. See fqir.

fqih: a person who knows Islamic law; a Qur’anic teacher; a marabout, usually a minor one.

fqir (pl., faqra): a patrilineal descendant of ‘Umar ben 1-Khattab; a mystic; a poor person.

funduq: hostel for travelers or the urban poor containing small sleeping rooms and stables.

hajj: the pilgrimage to Mecca; also used as a title by those who have made the pilgrimage.

haqq: obligation; share or right; truth.

hshuma: impropriety; impertinence; shame.

hshumiya (theshshem): propriety; deference.

“Um (pl., “ulurn): religious knowledge; religious scholarship.

imam: prayer-leader.

jinn: a form of supernatural being.

jma‘a: council or gathering.

Ka‘ba: the sacred house at Mecca around which the circumambula- tion is performed.

karama: miracle story; sign of God’s bounty; generosity.

kelma: “word” or authority.

khayma: tent; residential unit.

madrasa: school; in this study, one of traditional Islamic higher learning.

Maghreb: North Africa; also the Arabic term for Morocco.

Makhzen: colloquial term for the Moroccan government; “the place where treasure is stored.”

marabout: a person, living or dead, thought to have a special relation toward God which enables him to ask for God’s grace on behalf of his clients and to communicate it to them.

Marrakshi: person from Marrakesh.

medina: city; in North Africa this term often specifically designates the traditional, precolonial part of a city.

mektub: “that which is written”; God’s will.

melhaqa (Fr. annexe): a subdivision of a cercle (da’ira) with a qaid appointed over it (an administrative anomaly in Morocco, of which Boujad is virtually the sole example).

mellah: a quarter inhabited by Jews and containing a synagogue; also loosely designates any quarter with a heavy concentration of Jews.

mokhazni: soldier; guard attached to the office of a qaid.

mqaddem: spokesman; one who represents another (used in a variety of contexts).

msarfa: a general term for social exchange; dealing.

Mulay (title): honorific title prefixing the name of a patrilineal descendant of the Prophet Muhammed.

musem: a periodic festival in honor of a marabout.

niya: faith or intent.

pasha: Moroccan official responsible for a town or city.

qadi: a religious judge.

qaid: tribal chief appointed over a tribe or small town during the protectorate; now a Ministry of the Interior official responsible for a rural or urban da’ira.

qa’ida: code for conduct; “the way things are done.”

‘qal: reason.

qodret Allah: God’s will.

qrab. Sttqrib.

qrib (pl., qrab): a person with whom one has close agnatic ties; a person with whom one has sustained bonds of obligation developed out of friendship, clientship, alliance, residential propinquity, etc.

Residence: the office of the French Resident General in protectorate Morocco; the administrative center of the protectorate.

ryal: a unit of Moroccan currency. In 1970 a ryal was roughly the equivalent of one American cent.

saheb (pl., ashab, shab): companion or associate; a person with whom regular transactions are made.

Salafi: a reformist Muslim.

saleh: a pious or devout person; a saint; in some contexts, a marabout. shaykh: religious teacher or head of a mystic order; government official.

Sherqawi (pl., Sherqawa): a person claiming descent from the marabout Sidi Mhammed Sherqi.

shorfa. See shrif.

shra‘-. Islamic law.

shrif (pL, shorfa): patrilineal descendant of the Prophet Muhammed through his daughter, Fatima.

Sid, Sidi\ honorific title of address used for marabouts and claimed descendants of ‘Umar ben 1-Khattab.

Sufi, Sufism: Islamic mystic; Islamic mysticism.

t‘argiba: the sacrifice of a bull to conclude or renew an oath of allegiance or to seek a truce; involves the imposition of compulsion (‘ar).

tariqa: Sufi brotherhood or mystic “way.”

tasawwuf ’. the practice of Sufism.

tata\ contractual ritual alliances (preprotectorate).

theshshem. See hshumiya.

‘ulama. See ‘alem.

‘ulum. See “Um.

wali\ saint.

wefh’. “face”; prestige.

zakat, alms tax.

zawya\ religious lodge or residence of a prominent marabout.

Zawya Sherqawa: one of the two leading Sherqawi descent groups, formed in the late nineteenth century.

zewwar-. “visitor,” a maraboutic descendant who acts as intermediary between clients and his maraboutic ancestor.

zyara: local pilgrimage to a maraboutic shrine; an offering to a marabout.

[1] Parsons’s judgment is curious, since he characterizes his own work as no more than a paradigm (1964:485). It would appear that Weber asserts no more for his own work (1964:109).

[2] Dead, that is, from an observer’s point of view. For those who believe in marabouts, “dead” ones are alive and well in their shrines, ready to influence the turn of events in this world.

[3] Here I should point out that I use the term maraboutism in a broader sense than is usually found in the French literature. Many French writers, including Berque (1957:14), distinguish between maraboutisme, conf r er is me and other forms of religious organization. Yet these all share the underlying notion of a hierarchical relation between man and God. Although useful in some respects, Berque’s categorization is misleading for such maraboutic groups as the Sherqawa, which exhibit characteristics of various forms of organization that Berque sees as necessarily competing. To my knowledge, only Ali Merad uses mara- boutisme in the broader sense that I do. One other caution is here in order. I have decided to reserve for a later study, which will deal with traditional Moroccan intellectuals, the exploration of varieties of what I here call “formal” Islam, such as modernism, reformism, neofundamentalism, and so on. From the vantage point of Boujad and other parts of rural Morocco, the distinction between these various intellectual currents tends to blur.

[4] After the protectorate was established in Morocco, it would appear that the French regarded only the nonindigenous elements of society as inherently “progressive.” For a detailed account of the formation of colonial stereotypes toward Moroccans, see Burke 1973:175–199.

[5] Such assumptions became powerful ideological weapons in the hands of political advisors to the French Residence. For instance, they were used to justify the separation of native from European populations in the cities on the basis of a Muslim “preference” to be so isolated. They also justified such French policies as the famous Berber Proclamation (daher) of 1930, which removed Berber-speaking regions of Morocco from the jurisdiction of Islamic law. The goal was to foster a separate Berber (i.e., non-Arab and to a certain extent non-Muslim) identity. Jacques Berque has sarcastically referred to these policies as an attempt to create a Berber ethnographic reserve or “national park” (1967).

[6] The translation is by the author, as are subsequent translations unless otherwise indicated.

[7] Bel originally intended to complement his study with two other volumes. One was to have dealt primarily with mara- boutism and religious brotherhoods. The other was to have dealt with “pagan survivals” in Islam. Neither was ever published, although his approach to both themes is readily apparent in his first, published volume.

[8] The term tariqa also signifies a religious order to which affiliation is in principle individual and voluntary.

[9] Along with other writers, Bel assumes that there is a conscious deception involved on the part of many who claim to be marabouts. Foreign travelers and diplomats in the late eighteenth and early nineteenth centuries provided some supporting evidence for this notion. Ali Bey (Domingo Badia y Leblich) met a marabout, “a better sort of man,” who admitted that he was a cheat. “He repeated often his favourite saying, that fools are made for the amusement of men of ability.” The attitude of religious scholars toward marabouts which Ali Bey reports is remarkably similar to present-day attitudes: “The Fakih and the Taleb pass over these tricks in silence, and leave the people in their folly, though they themselves know very well what to think of it, and conversed very frankly with me upon the subject” (1816:48–49).

Chenier (1788:179–191) presents a similar view of marabouts, although he differentiates types of marabouts more clearly than Ali Bey. Chenier describes “sainthood” as a lucrative profession or trade, passed from father to son or sometimes from master to servant. He also claims that among his friends was a well-known saint who admitted to him that he was an impostor.

[10] The formal conception of educated Moroccans (and that of the current Moroccan constitution) is that the king is only the “commander of the faithful” (amir l-mu’minin). Nevertheless, for all practical purposes the doctrines of the sultanate (temporal authority) and the caliphate (spiritual authority) are popularly fused. Elsewhere in the Muslim world the distinction between these two conceptions is often highly significant.

[11] This was the stillborn “Projet de constitution marocaine” drafted by a “young Turk” coterie which surrounded Sultan Mulay ‘Abd 1-Hafed (reigned 1908–1912). This was one of the last-minute efforts to reform Morocco to enable it to cope with the growing European influence over its affairs. Article 7 of this document reads: “Tout sujet du Royaume doit obeissance a ITmam cherifien et respect a sa personne parce qu’il est 1’heritier de la Baraka [All subjects of the kingdom owe obedience to the Shrifian Imam and respect to his person because he is the inheritor of the Baraka]” (cited in Robert 1963:311).

[12] Most of the royal decrees mentioned are from translations into French made under the direction of Claude Ecorcheville while he was controleur civil of Boujad in 1938. These are indicated by E in the text. (On the accuracy of these translations, see my note in the bibliography.) Material taken directly from the unpublished correspondence of Sherqawi families in Boujad is indicated by S’. Dates are given in both Muslim and Christian Eras.

[13] One exception is Da’ud’s encyclopedic local history of Tetouan, which is still in progress (1959-). Although not explicitly a social history, it includes numerous references to marabouts and suggests the wealth of documentation available, at least in some regions, for local history. Mukhtar es- Susi has written a similar local history for the Sus.

[14] The account of ed-Dila which follows is based primarily on Drague (1951:137–139), although Hajji (1964) has also been consulted.

[15] Similar ties were earlier maintained with the declining Sa‘adi dynasty. Sultan Mulay Zidan (reigned 1613–1627) is reputed to have built the shrine of Sidi Mhammed Sherqi’s mother, Laila Rahma. It is located along the Umm er- Rbi‘ River, to the east of Qasba Tadla. The sultan probably constructed the shrine as an attempt to gain favor both with the Sherqawa and with their tribal clients.

[16] Al-Ifrani obliquely refers to a “great misfortune” which befell him. Evidently he fell out of favor at the court of Mulay Ismahl and sought refuge at Boujad for several years (Levi-Proven^al 1922:115, 119–120).

[17] Myths and oral traditions concerning him that are current on the Tadla Plain will be presented and analyzed in chapters 6 and 7.

[18] Examination of the tension between the sultanate and marabouts for a later period, the eighteenth century, is provided by Morsy’s excellent essay on the Ahansal (1972). The presence of a European witness provided the key text for her examination of the otherwise reticent “official” historiographies and elements of local legends.

[19] The maraboutic successors to Sidi Mhammed Sherqi are called “lords” (sid-s). Names in the text which also appear in accompanying figures are given numbers to facilitate identification. The number before the hyphen refers to the figure in which an individual first appears. The same number is also used in later figures.

[20] Mhammed ben Naser also had ties with the zawya at ed-Dila. Likewise Sidi Mhammed 1-Ma‘ti was lord of the Sherqawi zawya during ed-Dila’s apogee, but the texts again give no clue as to the substance of these ties. Drague is incorrect in describing the Sherqawi lodge as “subsidiary” to the Nasiriya order, although his informants at Tamgrut in the 1930’s may have made such a claim. Drague may also have simply repeated the error of Cimetiere’s earlier account (1913:287). The affiliation of individual Sherqawa had no effect on their descendants, according to contemporary Sherqawa.

[21] This individual is a grandson of Sidi Mhammed Sherqi. Hmadsha legends make Sidi ‘Ali a disciple of Sidi Mhammed Sherqi, a chronological impossibility (Crapanzano 1973:30–37).

[22] I am grateful to Muhammed Sherqawi for this information ,which he bases upon manuscript sources which I have not yet been able to verify personally. I have, however, seen a deed (resin) authenticating the sultan’s ownership of a house in Boujad.

[23] For a detailed description of such arrangements in the Moroccan southeast, see Dunn 1971.

[24] A more extensive analysis of these holdings and subsidiary zawya-s, with the documentation available for each of them, has been presented in Eickelman 1972–1973. To the list given there should be added Sidi Mekki Sherqawi, patron marabout of the town of Azemmur. A group of his claimed descendants lived about twenty kilometers from the town. Until the 1920's, a living descendant of Sidi Mekki lived in the town itself and accepted offerings (Le Coeur 1969:120).

[25] The Makhzen itself seemed unclear as to the status of these estates. In 1901 Sultan Mulay 'Abd l-'Aziz ordered the properties of the Sherqawi zawya to be divided equally between two rival lords (E, 20 October 1901 / 7 Rejeb (1319). A marabout from the zawya at Wezzan was sent to supervise the division. According to Sherqawi informants, he discovered that, unlike the situation in Wezzan, where 'azib-s were considered the collective property of the zawya^ most of the Sherqawi 'azib-s were owned by individuals and could be divided only by the laws of Islamic inheritance. Consequently he reported to the sultan that the Sherqawa were fighting for property which in any case could not be divided (Eickelman 19721973:45, Ecorcheville 1938:72). However, Jacques Berque has kindly informed me that there were also private 'azib-s at Wezzan. This suggests that other factors came into play in the decision attributed to the Wezzani marabout.

[26] In a posthumously published document, Foucauld quotes the following Sherqawi comment on relations with Mulay Hasan I: "We don't fear him and he doesn't fear us. He can't harm us and we can't harm him" (1939:135).

[27] The qadi from 1894 until the early years of the protectorate was Mhammed ben Saleh, of the Qadiriyin descent group of the Sherqawa. Shortly after the death of Sultan Mulay Hasan I in 1894, one prominent Sherqawi sent Mhammed ben Saleh a note concerning an inheritance dispute in which he was an interested party. It stated his intent to pursue the dispute as soon as the authority (sulta) of the Makhzen was restored (E, Mhammed ben Saleh to 'Umar ben Sidi ben Dawd, 17 March 1894 / 10 Ramadan 1311).

[28] If slaves were maltreated, they often ran away and sought refuge with marabouts or other intermediaries until given assurances by their masters that their condition would improve.

[29] At the end of his stay in Boujad, Driss gave Foucauld a letter offering his services to the minister of France in Tangiers and asked whether he would be made a qaid upon the arrival of the French (Foucauld 1939:135). In 1907 Driss sought Foucauld's intervention to obtain his post with the French consulate in Casablanca (Gorree 1939:62–72).

[30] Evidence of 'Umar's role is primarily oral, although it is supported by the fact that correspondence relative to Mha, as well as copies of the correspondence which passed between the sultan and Mha, was found among 'Umar's papers (S. 24 November 1882 / 13 Muharrem 1300; 20 July 1883 / 15 Ramadan 1300; 3 December 1883 / 2 Safar 1301). These letters were addressed to Sidi ben Dawd.

[31] The substance of the complaint was that ‘Umar had appropriated for himself revenues derived from allowing individuals to be buried on the grounds of a Sherqawi zawya in Meknes.

[32] This distinction eluded Drague (1951), among others.

[33] The inhabitants of the region consider the Tadla Plain as stretching roughly from Bni Mellal to Khuribga. This is the usage which I follow. Recent geographical studies (Martin et al. 1967; Noin 1970) delimit the part of this plain surrounding Khuribga as the Phosphates Plateau. This delimitation is based on the criteria of geomorphology and modern economic activities but is peripheral to accepted popular usage.

[34] Jacques Berque, originally a controleur civil during the protectorate, has suggested a connection between the appropriations which did take place in this region in the late 1920’s and the Wad Zem massacre of 23 August 1955 (1967:35). On the morning of that day, the Sma[4]la cut the telephone lines to the town and invaded it, killing eighty-seven Frenchmen out of a population of eight hundred within a few hours. In reprisal at least five hundred tribesmen were killed by French ground and air forces in subsequent days; houses were destroyed and animals slaughtered. The uprising was considered the most significant rural resistance to the French in the waning years of the protectorate.

[35] In 1963, 35 percent of Boujad’s adult (over age 21) residents had been born in the surrounding rural area. Eleven percent came from other regions of Morocco. The remaining 54 percent had been born in Boujad itself. (These figures are calculated from the municipal electoral lists, 1963). The assumption of an increased rate of immigration is based primarily upon the qualitative appraisal of Boujadi-s and upon more general demographic studies (e.g., Noin 1970: II). Statistics comparable to those of 1963 are not available for earlier periods.

[36] Zyara is also the term used for visits to Mecca outside of the pilgrimage season.

[37] In the dialect of the Tadla Plain, derb is synonymous with huma, although the latter term is rarely employed. This usage can be confusing, since, in the dialect of Fes, huma means “quarter,” while derb signifies an alleyway or impasse. Thus, in Fes, a hurra contains a number of derb-s. I point out this variation in order to avoid possible misunderstanding.

[38] For a detailed, broadly analogous description of the internal changes of a market in northern Morocco and its postprotectorate transformation, see Fogg 1938.

[39] Seventy-five percent of the animals brought to the market are sheep. Goats comprise another 12 percent, cattle 7 percent, and other animals—camels, donkeys, and horses—the remaining 6 percent (Raynal and Andre 1955).

[40] In the late 1960's the rural holdings were taken over by the Ministry of the Interior and in principle exchanged for equivalent urban holdings in the interests of agrarian reform.

[41] Two of the non-Sherqawi shrines are dilapidated, virtually unvisited shrines in an old, abandoned cemetery to the north of Boujad. One shrine belongs to 'Ali ben S'id; the other is supposed to be the shrine of a marabout of the neighboring Sma'la tribe. Both these marabouts are regarded as having lost their religious powers because of the empirical fact that their shrines are untended. They are also falling into obscurity. The third non-Sherqawi shrine is that of Rabbi Lewi, located in the midst of the Jewish cemetery. Jews of Boujad origin who now live in Casablanca still return on occasion to visit it and see to its maintenance.

[42] There were fewer visitors in the remaining two weeks of the festival period. A very rough estimate is an additional ten thousand.

[43] The term "shadow qaid" I owe to Clifford Geertz. He uses it primarily to refer to the common administrative pattern in which the "stranger" who is qaid in one region informally consults a native of the region who is qaid elsewhere. The latter person is the "shadow qaid." I use the term more broadly because in my experience in western Morocco, such "shadows" are commonly locals who hold no formal administrative posts.

[44] Since 1970 Boujad has had no regular qadi. The Ministry of Justice decided there was not a sufficient case load to warrant a full-time religious judge. One is supplied from a neighboring town on each market day.

[45] This formulation of social structure owes much to discussions with Lawrence Rosen, Clifford and Hildred Geertz, and Lloyd A. Fallers. For Rosen's development of the concept, see his account of Arab-Berber relations (1973) and Arab-Jewish relations (1972). In addition, many of us interested in Morocco have been aided greatly by Fallers's earlier work on Buganda (1959: esp. 23). For a discussion of similar problems in Iran, see Bill 1973.

[46] An example of this dissociation in a Sherqawi quarter is the one which claimed as eponymic ancestor Sid 1-Mursli, one of the sons of the founding marabout. It was located next to the shrine of Sidi Mhammed Sherqi. Presently it is remembered by only the oldest Boujadi-s, although descendants of this marabout are still in Boujad and entitled to a share in the offerings of the main shrine. The buildings which constituted the quarter still exist. Many elderly Sherqawa still live there. It is simply not regarded as a quarter anymore. Some of the households are now tacitly assimilated into neighboring Sherqawi quarters. Jewish residential areas followed a similar pattern. As I mentioned earlier, Boujad never had a mellah in the strict sense of the term, although the quarter in which the synagogue was located was called the mellah. When all but one Jewish household departed in 1963 and the synagogue was deconsecrated, its quarter quickly became known as part of Qadiriyin, the Sherqawi quarter which encompassed it. A more dramatic indication of these shifts is the difficulty which local officials have in using an administrative map of quarters prepared by the French in the 1930's, which is still supposed to be employed for governmental purposes. Many of the boundaries have shifted,

and several names are unidentifiable. Although they are supposed to use the labels provided by the official map for such things as election registration, officials admit that they are unable to do so and instead use the nomenclature “which everyone knows.”

[47] In recounting this episode, informants regarded this turn of good fortune as a sign of God’s favor to Bu Bakr and attached no adverse connotations to his behavior.

[48] A brother of Mali’s (7–6), actively seeking a government post at the time of field research, indicated how the same calculations of “closeness” operate in other contexts. He told me that his weld ‘amm (father’s brother’s son), a government clerk m Rabat (7–2), was helping him in the matter. In this case, the “actual” link (i.e., in terms of Islamic law) was known. The person claimed as weld ‘amm by Islamic law was actually his sister’s husband’s mother’s sister’s son (weld khut umm raj el khuti) or—since both one of his brothers and his sister had married into the same household—his brother’s wife’s mother’s sister’s son. Again the justification offered for using the term weld ‘amm was the quality of “closeness” claimed to exist between the two persons.

[49] Bni Zemmur is an administrative creation of the protectorate. The colonial government, like the precolonial Makhzen, often created “tribes” for administrative purposes. Tribesmen recognize the term Bni Zemmur as a vague clustering of their “actual” tribes but not as a unit of effective social action, except in so far as the government treats the “Bni Zemmur” as a reality. Tribesmen regard their “actual” tribes—i.e., those with which they identify in nongovernmental contexts—as Rwashed, Shegran, Bni Battu, Bni Zrantel, and Wlad Yusef. These are officially considered to be sections of the Bni Zemmur.

[50] It has sometimes been asserted that all tribes in North Africa can be described in terms of segmentation. Elsewhere, I plan to deal at length with the issue of segmentation theory and its relation to rural social structure in North Africa. Attempts to apply segmentation theory to North Africa are interesting for some of the epistemological considerations they raise but are peripheral to the main concern of this book. Besides, many anthropologists and social historians interested in North Africa since the mid-1960’s are only now preparing monograph-length studies. A discussion of broader epistemological issues will become more meaningful when these are available so that they can be contrasted with the earlier contributions of colonial ethnographers. For the nonce, the most thorough, and devastating, critique of the concept of segmentation as sociological theory can be found in Peters’s (1967) account of the Bedouin of Cyre- naica, earlier described as segmentary by Evans-Pritchard (1949) (although with none of the thoroughness of his studies,of the Nuer). Summaries of recent empirical research indicating that the concept is no more accurate as a sociological description of the tribal organization of preprotectorate Morocco can be found in the contributions of Seddon and Vinogradov, explicitly, and Dunn, implicitly, to Gellner and Micaud, eds., Arabs and Berbers (1973). An earlier but highly thoughtful French discussion of the problems of social identity inherent in defining tribe can be found in Berque (1953).

[51] No ties are claimed with the component groups of the Bni Zemmur of the Boujad region, although in practice the two groups have had multiple ties through the Sherqawa, shared pasture lands, and factional alliances prior to the protectorate. In calling these groups “tribes,” I am following local usage. Several French administrative reports term the Sma‘la and Bni Zemmur “confederations,” although this usage is not consistent.

[52] Since independence the Moroccan government has officially abandoned the division of rural Morocco into tribes. These have been replaced with rural “communes” (jma‘a-$\ each of which generally carries the name of the tribe residing in it. In principle, each commune has popularly elected officials who form its council. This group, under the tutelage of its qaid, administers a small budget for public works. The principle behind the reform was to replace primordial loyalties, encouraged during most of the protectorate, with broader, national ones. Despite sincere efforts on the part of many administrators, the impact of the communal system remains politically and socially marginal.

[53] Townsmen frequently claim that tribesmen are ignorant of Islam and thus pay no heed to these formal religious activities. Such claims are hardly new. There is preprotectorate evidence for the existence of such rural mosques for the neighboring Shawya region, along with denials of their existence by townsmen (Mission Scientifique du Maroc 1915:1, 121).

[54] Informants claim a similar flexibility prior to the protectorate despite the much greater occurrence of intergroup hostility. The preprotectorate manuscript correspondence which pertains to the nature of “traditional” tribal organization mentions only the relations of tribes and tribal sections. This is to be expected, since most of the correspondence concerns Makhzen intervention in tribal affairs (S, ‘Ali Mesfyuwi to Sidi ‘Umar Sherqawi, 17 December 1881 / 25 Muhar- rem 1299; S, Driss ben ‘Umar to Sid l-‘Arbi, February 1894 / Sha‘ban 1311; E, Mulay ‘Abd l-‘Aziz to Sid 1-Hajj 1-Hasan, 25 January 1903 / 25 Shawwal 1320).

[55] Milk brotherhood is created when two children are nursed by the same woman. In Islamic law, persons thus linked are treated as full siblings for purposes of marriage, although they gain no rights of inheritance. It should be noted that, although the terminology reported here is current throughout western Morocco and the Middle Atlas Mountains, variations exist elsewhere. I quote in full a personal communication from Ross Dunn (1974): “Alliance through the milk exchange was called tafargant among the Ait ‘Atta (particularly referring to their alliance with the Bni Mhammed). It is clear that the ‘Atta made a clear distinction between tafargant (which included a marriage taboo) and tata. That is, the ‘Atta do not seem to have regarded tafargant as a type of tata, but as something quite distinct.”

[56] There are two ways to account for this apparent anomaly of the mixing of “levels” of tribal organization. One is to suggest that, in the sixty years which have elapsed since this alliance was contracted, one group or the other has been either “raised” or “lowered” from local community to tribal section or vice versa as the result of the internal realignment of tribal organization. Alternatively, it is equally plausible that such an arrangement simply made sense in terms of tribal geopolitics and the demographic size of the two groups involved. Informants from the two groups saw no anomaly; only tribal strong-men who deal regularly with the administration speak of clearly demarcated “levels.”

[57] Informants were unable to tell me whether in these cases tata also involved marriage prohibitions between the contracting groups. See note 12 above.

[58] His name suggests that his tribe of origin was the Ait ‘Atta, a powerful Berber group situated in the High Atlas Mountains to the south of Bni Mellal. Neither David M. Hart (personal communication, ca. 1971) nor Ernest Gellner (personal communication, 1969), both of whom have written extensively on this tribe, can identify him.

[59] The French, misunderstanding the Moroccan concept of baraka^ or perhaps understanding it all too well, recognized and supported only one of the two rival Sherqawi lords of this period as a marabout.

[60] For an excellent discussion of the same concept in a biography of a Casablanca merchant, see Waterbury (1972: esp. 155156).

[61] For a fuller elaboration of this term in its classical context, dissimilar but not unrelated to contemporary Moroccan usages, see Izutsu 1964:203–219 and the discussion in the text of reason as a social concept.

[62] A Muslim general, d. 681.

[63] D. 792.

[64] “L-bashar ‘andhom l-‘qal. Ta-ymiyzu bin 1-haja Hi ddorhom we-l-haja Hi ma ddorhom-sh.”

[65] The implicit metaphor is that thoughts, like vegetables, must ripen and mature before being offered for consumption.

[66] For all practical purposes in terms of Islam as popularly understood in Morocco, Christians, generally called the rumi-s (Romans), fall outside the sphere of ordinary social action. The problem of how Christians demonstrate reason is one which does not immediately present itself to Boujadi-s, few of whom have had regular contact with foreigners.

[67] Abstinence from drinking usually begins a month prior to Ramadan.

[68] This account is consciously meant to trace the inculcation of these concepts in men only. The socialization of females is similar with respect to propriety but differs considerably in other aspects crucial to male-female roles. For one thing, daughters traditionally remained in the care of their mothers, while boys were expected to move beyond the women of the household circle at an early age. The spread of education for girls, especially in towns, undoubtedly will rapidly result in changing conceptions of propriety in relation to public space. Unfortunately this topic has only begun to be investigated, and the best discussion to date (H. Geertz 1974) is still in mimeographed form.

[69] My informant’s wife called regularly at the house of the official. These visits were never reciprocated, since the wife of the high-ranking man was never allowed to leave her house. The visiting pattern indicated the ranking of the households in relation to each other.

[70] In classical Arabic, haqq is frequently used in the sense of “truth” or “that which can be verified.” It is used in this sense in records of court proceedings, which, of course, are conducted in classical Arabic. In colloquial use, ‘andek l-haqq can in some contexts also be translated as “you’re right.”

[71] Of a nearly complete sample of 838, only 61 (7.3 percent) of Bou- jad’s merchants and craftsmen had acquired capital from other individuals for their enterprises in 1970. Of these 61, 37 (60.7 per cent) had borrowed from kinsmen. In a few such cases, the owner of the capital would effectively assert dominance over the activities of the borrower. A very few cases of real partnerships existed, almost always between kinsmen, in which both worked in the same shop. Such partnerships, even between brothers, tended to have very short lives. The only exceptions to this overall pattern are Boujad’s itinerant rural cloth-sellers. As mentioned in Chapter 3, these individuals were originally Qur’anic teachers (fqih-s) who took over the business of Jewish merchants shortly after independence. These traders act collectively in their purchases, share storage space in Boujad, and in other ways regularly act in one another’s interests. Bou- jadi-s consider this cooperation exceptional and attribute it to the fact that, as former Qur’anic teachers, the clothsellers are really trying to live according to the principles of Islamic brotherhood.

[72] Men claim no formal knowledge of these processions but, since they involve activities in public space, quietly plan to the last detail the hire of carts and musicians and the route the public display will take in order to avoid possible embarrassment to the household. Male servants often accompany such processions to maintain order. No women and children of higher prestige participate in the public processions. Hence such processions tend to consist primarily of clients and lower-ranking neighbors, at least in the case of more distinguished households.

[73] For an extensive presentation of examples of situations involving the “greater” and “lesser” ‘ar and the means for their invocation, see Westermarck 1926:1, 518–564.

[74] The word is derived from “ar on the istif”al pattern of formal Arabic. This pattern is used to make up words which include in their meanings the action of asking for or requesting.

[75] The term “shur is also sometimes used for offerings to marabouts.

[76] This term is also used to denote a refusal to accept the political authority of the Makhzen, as in tribal rebellions.

[77] The judge later counseled the father to drop the case. He tried— in his words—to make him “see reason and avoid “arT

[78] Only one tribal informant ever directly applied the analogy of manman and man-God relations and spoke of “dealing” (jrtsarfa) with God and his associates (ashab, sg.^saheb). Since the Qur’an explicitly states that God has no associates, other informants, including those maintaining ties with marabouts, spoke of the above statement as coming from someone ignorant of Islam (jahel).

[79] I plan to devote a later, separate study to the analysis of the content and rhetorical form of these myths. Although such covenants are to my knowledge represented only in the form of myths in western Morocco, written covenants exist elsewhere. Berque (1955:278) reports one that dates from 1840 for a Berber-speaking group of the High Atlas Mountains.

[80] For the Arabic version of this myth and bilingual presentations of two others, see Eickelman and Draioui 1973.

[81] Meknasi is one of the eleven children attributed to Sidi Mhammed Sherqi.

[82] Ascent to the top of Mount ‘Arafa is forbidden to pious Muslims.

See the article on “Mount ‘Arafa” in Gibb and Kramers, eds. 1961.

[83] The underlying concept here is that life is a gift of God which can be taken back at his will.

[84] This quotation is in saj’ verse, a sort of limerick rhyme often indicative of supernatural inspiration. See the article “Kur’an” in Gibb and Kramers, eds. 1961 for a more complete description. Note the implicit contradiction in the words of the marabout. He claims that those like him can forbear but then expresses his grief over the loss of his son.

[85] Literally, l-amana dyal l-haqq, “the trust which belongs to God.”

[86] I.e., “If this is our reaction to the loss of this son, what will we do at the death of another?”

[87] It is unclear whether Sidi Mhammed Sherqi says this sentence as if his wife were not present or whether it is spoken by the narrator. I am assuming the latter to be the case.

[88] A spring located in Boujad.

[89] Sem‘li is the singular of Sma‘la. Note that at this point the Bni Zemmur cease to be mentioned in the myth.

[90] The implication is that the marabout was in a shrine.

[91] T esq aw. lit., “to irrigate” or “to nourish.”

[92] Khelfiya, Sidi Mhammed Sherqi’s wife, is, like the marabout himself, considered to be a descendant of ‘Umar ben 1-Khattab.

[93] Human sacrifices are, of course, prohibited in Islam. Note that, for the second time in the myth, the marabout is compelled to take a particular action as a result of the interference of his wife. The first time was when her uncontrolled grief compelled him to settle elsewhere.

[94] Sidi ‘Ali died in either 1718/1719or 1722/1723, over a century after the death of Sidi Mhammed Sherqi (Crapan- zano 1973:23). Such historical precision is, of course, irrelevant to the social relations which are thought to have existed between the two.

[95] In social actuality, the component groups of the Bni Zemmur maintain ties with the Sherqawa but are regarded as lacking faith (niya) by the Sherqawa and surrounding tribes. This lack of faith, indicated by merely nominal offerings to the Sherqawa, is said by many tribesmen to account for the poverty of the Bni Zemmur in relation to other groups.

[96] A similar equivalency occurs in actual social relations. An isolated example occurred as recently as 1969. A tribal group in Dukkala wanted a Sherqawi whom they considered prominent to live among them. They built him a house and provided a tribeswoman as wife. The tribesmen themselves paid the entire bridewealth (sdaq) to the girl’s father. The Sherqawi did not participate even symbolically in raising the bridewealth. This is the only such exchange that I know of to have occurred in recent years, but once they appear to have been more common. Le Coeur (1969:120), who studied the town of Azemmur between 1930 and 1933, reports that, until a few years before his arrival, there was a living marabout who claimed descent from Sidi Mekki Sherqawi, patron marabout of the town and its region. Offerings were regularly made to him, including young girls selected by lottery. Unfortunately Le Coeur gives no further details. Le Coeur was also told that this marabout passed his time smoking kif (hemp), drinking rum and tea, and openly avoiding prayers and the fast. Such activities evidently were taken as a sign of his special insights.

[97] Some Sherqawa, usually from the same descent grouping, have competing claims to the right to “work” certain tribal groups. In this circumstance some agree to work in teams, others to divide the proceeds of such visits.

[98] Some of these contrasts have been suggested by Turner (1973).

[99] Significantly, each bull offered at that time represented a separate tribal section. As

with sacrifices at the shrine of Sidi Mhammed Sherqi, the bulls were offered simultaneously, but not on behalf of any supersectional collectivity.

[100] On the significance of this color and other points, neither the Sherqawa nor the Sma‘la offer any explanation.

[101] More distant groups from Shawya often simply offer cash.

[102] Conditional offerings are called, literally, “that which the marabout picks up” (l-merfuda dyal esh-shaykh). These frequently are offered in the case of illness by individual clients. The father of a sick infant, for instance, will choose an animal of his herd, which ideally is the age of his child, and whisper in the animal’s ear that it will belong to the marabout if the child recovers. The sacrifice is actually made only if there is a successful recovery.

[103] The need to maintain baraka by controlling access to its possessors is a major reason why women are often discouraged by the Sherqawa from seeking access to marabouts and prominent visitors. One visitor explained to me that women can rarely make significant offerings of their own. They often offer small coins at the major shrine and occasionally will sleep overnight next to the sepulcher of Sidi Mhammed Sherqi. Only men can make or offer to make sacrifices, so that husbands and wives generally go together to shrines for major invocations or to deliver sacrifices which have been promised to a marabout for services rendered. Many activities associated with women are strictly forbidden by custodians at the major shrines. At unattended shrines, women often smear henna on the portal or leave locks of their hair and small strips of cloth torn from their garments as reminders of the request they have made to the marabout. Such conduct is forbidden at major shrines, although it is often attempted.

[104] Fqir has this sense primarily on the western plains of Morocco: Shawya, Tadla, and Dukkala (see Westermarck 1926:1, 35–36). David M. Hart (personal communication, ca. 1972) reports a similar use in the Rif. In addition to Sidi Mhammed Sherqi, two other major marabouts on the western plains also base their legitimacy on ‘Umari descent: Sidi Shegdal ben Ghilan (Bni Shegdal) and Sidi ‘Ali u Brahim (Aid Bu Zid, Wad Nfis). In classical Arabic, fqir signifies a religious ascetic (Bel 1938:352), as mentioned in Chapter 1. In current speech the term is also a polite way of referring to an impoverished individual. Among many young, urban Moroccans, the distinction between joqra and shorja is currently often blurred or nonexistent.

[105] Of course, even Figure 2 telescopes past events by omitting reference to any but recent contests for the lordship. Many Sherqawa, in reciting Sherqawi lords, omit one or the other of the variant lordship lines for this century.

[106] A slightly different version of the ties of Sidi Mhammed Sherqi with some of the tribes of western Morocco is offered in al-Qadiri’s seventeenth-century biography of the marabout (1913:127–129). He writes that the Sherqawi lord was originally from the Werdigha tribe (near present-day Khuribga), which in turn was from the Bni Jabir. Although many Sherqawa knew of the existence of this account, they saw no need to reconcile the two versions. After all, they reasoned, the ties of Sidi Mhammed Sherqi with these groups

are “known,” and they are all descendants of ‘Umar.

[107] Sultan Mulay ‘Abd 1-Aziz (reigned 1894–1908) was named after this marabout because he was born near the marabout’s tomb while his father was on a military expedition.

[108] These facing shrines are tended by a small group of descendants of Sidi bel Gasem (including one Sherqawi from Boujad), each of whom has specified days on which he collects offerings. There is also a small festival held each fall at the shrine of Sidi bel Gasem, attended primarily by Berberspeaking groups. Since knowledge of the clients of marabouts is highly concentric, few of the Boujad Sherqawa have any specific knowledge of the activities associated with this shrine.

Laila Rahma is said to have been from the Drissi dynasty, the first descendants of the Prophet to rule in Morocco. In the 1930’s, this claim was legitimated by an elaborate genealogy of twenty-four individuals, some of whom have tombs on the Tadla Plain (Ecorcheville 1938). No one to whom 1 spoke during my fieldwork could refer me to anyone able to recite this genealogy.

[109] Partial evidence for this is a directive from the Grand Wezir to Qaid ‘Abd 1-Qader of Boujad (E, 7 February 1927 / 4

Sha‘ban 1345) ordering the payment to be made. Other directives from the Grand Wezir to the qaid from this period (E: 14 February 1927 / Il Sha‘ban 1345; 20 May 1927 / 18 Qa‘ada 1345) indicate several other disputes over revenues from Sherqawi shrines. There is no evidence of any such official intervention in maraboutic affairs after 1929, a fact which indirectly confirms Marty’s assertion to that effect (1929:575–600).

[110] There are also tombs for two daughters of Sidi Mhammed Sherqi, both of which are visited only by women. Neither tomb has custodians. One is that of Laila Mina, next to that of Sidi Mhammed Sherqi. She is said to have had the baraka to weave a jellaba for him in a day, an activity that normally takes weeks or months. The other tomb, of fairly recent origin, is that of Laila Hniyya, supposedly efficacious at reconciling quarreling couples. Women leave strips of their clothing stuck with henna to its door. So far as I could gather, both tombs were maintained by the municipal budget. The only explanation I received for this was that both tombs were next to a main road, so that it would be unseemly to allow them to fall into disrepair.

[111] Boujadi-s and merchants from Demnat were affiliated with it (F. Berger 1929:47). There were at least three other zawya-s in Khnifra, each of which had as members merchants from a particular city or region. Fassi-s affiliated with the Tijaniya; Marrakshi-s with the Qadiriya, and so on. Each “alien” community also had its own quarter and tended to be occupationally specialized (F. Berger 1929:44–45). Unfortunately, Berger does not indicate patterns of affiliation to these lodges, if any, for the Middle Atlas Berbers.

[112] In 1969 the formal mqaddem-s included a zewwar who was also a weaver, a retail grocer, a bicycle repairman, a government shaykh and prayer-leader in a mosque, the custodian of a major Sherqawi shrine, a primary schoolteacher, and a notary.

[113] This account is primarily from a Sherqawi notary (‘adel) actively interested in the affairs of the shrine. The exact nature of the administrative or judicial tribunal which handled this dispute is unclear. Similar mechanisms for division exist among groups of shorfa., so it is possible that the French imposed the same pattern upon the Sherqawa by analogy.

Division of the offerings has not occurred in recent years because of charges of embezzlement raised in the late 1960’s against several of the overseers. Some Sherqawa unsuccessfully attempted to bring the dispute before various local government agencies. These echoed an old protectorate stand that “religious” matters were not a governmental concern. Others claimed that the dispute was a “family” affair which had to be worked out among the Sherqawa themselves. Meanwhile the mqaddem-s keep the offerings for shrine expenses.

[114] A tenet of Islamic law is that a woman can be married only to a man who is at least her “equal” (see Schacht 1966:162). What constitutes equality (kafa’a) in a legal context— wealth, social honor, education, descent from the Prophet or ‘Umar—would make a fascinating study, especially if historical shifts in its definition were taken into account.

[115] Unfortunately it is not possible to calculate the rate of such marriages for town-born commoners from my sample. My guess is that it would not differ greatly from the two known rates.

[116] The notarial fee in 1970 was 1.5 percent of the bridewealth (sdaq). Rural bridewealth is called ‘orram (lit., “heap”). Rural marriages are almost always concluded before the number of witnesses required by Islamic law. If it is ever necessary to go before an Islamic law court, it is thus possible to prepare a formal contract at a later date, based on the declarations of these witnesses. (Courts do not recognize marriages for which there is no valid written contract. This is important in legal cases involving inheritance and support.)

[117] In conceiving of Figure 14,1 have benefited from discussions with Hildred Geertz and from her study on Moroccan kinship (1974).

[118] Contemporary sociological usage prefers the more precise term cohort to generation. A cohort is defined as “an aggregate of individual elements, each of which experienced a significant event in its life history during the same chronological interval” (Ryder 1968:546). In the discussion in the text, I follow Mannheim’s older usage, which, in the context of his writing, is not open to the charge of ambiguity.

[119] J. Cimetiere, the first Native Affairs officer assigned to Boujad, incorrectly states that the visit occurred in October (1913: 289).

[120] There was only one exception to this policy throughout the protectorate. In the early 1930’s a brother of ‘Abd 1-Qader Sher- qawi, then the qaid of Boujad, was appointed as qaid of Fqih ben Saleh. But this individual had totally dissociated

himself from the affairs of the zawya and had served for some time as an officer in the French army.

[121] This assessment of him was contained in the draft of a French intelligence report of the 1930's. The French administration required monthly intelligence reports from its local officers, a section of which were devoted to assessments of the various notables. In addition, special reports were prepared on an annual basis. I have seen some of those written in the 1930's and early 1950's, in the form of carbons and drafts which the French overlooked in removing their confidential records from Boujad. These were mixed with less sensitive documents in a storeroom of the qaid's office in Boujad, to which I was given access by the local administration. Because of the disorder of the "archives" left behind by the French, they have evidently not been consulted since independence. Many of the documents, especially the drafts, lack the filing numbers that identify final copies. France has a fifty-year law concerning its archives but, for technical reasons, it is claimed, no post- 1912 records concerning Morocco are available for scholarly research. The Boujad archives are identified in references as B.

[122] For example, one merchant held an English patent as agent for an English-owned Shanghai firm with a branch in Tangiers which imported tea and sugar (B, Steeg to Commandant of Meknes region, 25/D, 23 March 1924). With the dispensation of the resident-general himself, a later patent was granted to the brother of the local leader of a religious order that was highly antagonistic to the Sherqawa (B. 10/BC, 23 February 1928).

[123] There were just under one thousand such rural adherents to non- Sherqawi brotherhoods in Boujad's tribal hinterland in 1952. The source for this estimate is the draft of a local intelligence report, which lists membership in the four major brotherhoods and breaks it down by local community. In no case are two brotherhoods found in the same local community, a fact that suggests the limitations upon personal maneuvers in the tribal setting. One order was limited in another way. The mqaddem for the Tijaniya brotherhood in Boujad told me that his order attracted only literate tribesmen, including some rural shopkeepers. The 1952 report partially confirms this, since only thirty-nine rural Tijani-s are claimed, never in the relatively larger concentrations indicated for the other religious orders.

Although the general trends indicated by these figures are corrobated by interviews, they must be treated with extreme caution. These figures were gathered during an upsurge of anti-French feeling in tribal regions, one significant index of which was the inability of the French to collect rural taxes effectively. The French were extremely suspicious of organizations of any form in the tribal hinterland, so that the informants were undoubtedly under pressure to minimize the importance of the brotherhoods.

[124] How tenaciously these ties were maintained can be seen in the fact that sixty-four tribesmen of the Boujad region fighting for the French in Indo-China in 1949 sent the marabout — qaid Sidi ben Dawd (2–15) a large sum of money to say invocations on their behalf (B.37/cl, 24 January 1949). Such offerings were also sent regularly from servicemen and workers in France, although not through official channels as were the offerings from Indo-China.

[125] The cordiality of these encounters was stressed to me by both the Boujadi-s and the French involved in these negotiations. Local archives confirm that the controleur of Boujad supported various educational improvements suggested

by local non-Sherqawi notables (B.1170 B / I, 6 June 1936; B.1181, 24 August 1938). To the credit of the local French officials, this was often done over the opposition of local qaid-s who, perhaps correctly, saw all expansion of educational facilities as a potential threat to their positions.

[126] For this reason, I am dealing with the topic of this small cadre of intellectuals in a separate study, now in preparation.

[127] Rezette characterizes the entire nationalist movement, even at the level of its national leadership, in similar terms. He calls this the “personalization” of power (1955:245–246, 282–285, 287).

[128] One local nationalist suggested that the French unwittingly contributed significantly to the nationalist movement by repeatedly imprisoning its suspected members. His own time in prison enabled him to meet at length and solidify ties of confidence with nationalists elsewhere in Morocco. What the experience of schooling had done for cementing ties between many nationalist leaders in Morocco’s larger cities, prison accomplished for those of smaller towns.

[129] To maintain the morale of servicemen in their overseas forces, the French had for decades employed a similar strategy. Special officers were assigned to France’s native Moroccan troops to aid in formulating and transmitting complaints of the troops about land disputes and other matters in Morocco. Such complaints seem to have been treated with more consideration than many of those locally originated, since written reports had to be prepared and retaliation was impossible (e.g., B.1344, 27 October 1952; B, Capt. Jeanlet, 2 December 1949; B.906, 11 July 1952). Overseas servicemen also complained regularly to the special officers about the excesses of qaid-s and certain Sherqawi notables. Such accusations are notably absent in court proceedings and other inquiries held in Boujad itself.

[130] This qaid increasingly yielded to pressure from the nationalists. Thus, after the bloody demonstrations in Boujad and Wad Zem in 1955, Boujad’s controleur sent the qaid a list of fifteen “responsible” local nationalists, ordering their arrest. The qaid’s signature was needed for form’s sake. Fearing reprisals, the qaid hurriedly consulted with one of the men on the list, who told the qaid to write down all the names of those killed during the day and to sign that list. He did, so that the French issued arrest warrants for those already dead. The local controleur was, of course, aware of the substitution, but in the waning days of the protectorate he was undoubtedly also aware of the futility and personal danger of challenging this maneuver.

[131] I have briefly indicated the sources for this account in the first section of Chapter 2. Arabic correspondence comes from the collections designated as E and S. There are several French accounts for this period. The earliest are contained in the archives designated as JP. The best of these accounts are J. Sicard’s “Note sur la situation religieuse des tribus traversees par la mehalla du Caid Layadi,” JP, Serie D, carton 20, May 1909, and Capt. Verlet-Hanus, “Notice comparative sur 1’etat politique des tribus traversees, rapport d’ensemble,” JP, March-May 1909. The fullest account is Ecorcheville 1938:89–114. Ecorcheville has told me (interview, 1970) his method of

preparing the account. As controleur civil of Boujad, he “invited” the two leading Sherqawi notables of the 1930’s, Qaid Hajj ‘Abd 1-Qader and Qadi ‘Abdallah, to provide him with any correspondence in their possession relating to the Sherqawa. These he supplemented with the files of his own archives. Ecorche- ville’s translator prepared translations from the Arabic of necessary documents. As he prepared his account, Ecorcheville frequently asked the two notables, particularly Qadi ‘Abdallah, to clarify points of detail for him and to explain when necessary the relations among the protagonists. Since Qadi ‘Abdallah had participated in some of these events and other Boujadi-s were also alive who had firsthand knowledge of them, I have used Ecorcheville’s account extensively. During my initial fieldwork in Boujad I was unaware of Ecorcheville’s study and constructed my own narrative of events based upon the Sherqawi correspondence (S) and the accounts of informants. The account in this appendix fully incorporates Ecorcheville’s study.

[132] For example, under the pseudonym Hajj al-Bashir (“the pilgrim bearing good news”), Driss wrote his father in February 1894/Sha‘ban 1311: “If you should speak with His Majesty soon concerning the Werdigha [tribe], tell him the following: Bni Khiran is being led away from the Makhzen by the Werdigha. Second, have the sultan order the Sma‘la to refrain from contact with Bni Khiran” (S). Much of the private correspondence which I have examined lacks signatures or in other ways seeks to obscure meanings, to prevent its use by hostile third parties. The identity of writers, however, is generally clear from their handwriting.

[133] Ecorcheville’s source was Sidi ‘Abdallah ben l-‘Arbi (2–13). As a youth he was with Mulay Hasan’s expedition or royal progress when the sultan died in 1894.

[134] Qaid-s were appointed, or reappointed, over most of the tribes of Tadla at this time.

[135] His laqab, or nickname, means “son of Zohra,” his mother. It is used because his personal name, Muhammed, could easily be confused with that of the leader of the rival faction.

It is difficult to assess the significance of his being named overseer of pious endowments. There are virtually no significant pious endowments in the immediate Boujad region, athough there are many to the south, in the region of Bni Mellal. It is unclear whether he was responsible for these, although the jurisdiction of the Sherqawi overseer of pious endowments appointed at French initiative after the protectorate included the entire region.

[136] The delegation, which included Mha u Hammu, was met by Mulay Hafed at Meshra Shayr, on the Umm er-Rb? River. They returned by way of the Sma‘la. Their movements indicate a relatively widespread support for Mulay Hafed at that time on the upper Tadla Plain.

[137] The following account is based primarily on an intelligence report by Captain Verlet-Hanus which appeared in the Journal Politique for May 1909.

[138] He later was to become one of the principal architects of the Berber policy of the

protectorate, which culminated with the Berber Proclamation of 1930 (Ageron 1972:144). An ardent Catholic, Marty allegedly passed out copies of the Bible in Arabic to Muslim visitors to his office.

[139] The letter (in S) carries no date, but its context indicates when it was written.

[140] A Berber from another region was reported to have fired the shot. The Sherqawa probably preferred such an account, although in the circumstances impossible to verify, since an attack by a Sherqawi client might be taken by the French as evidence of a complete loss of Sherqawi "authority."

[141] The letter was anonymous, and the French account of the incident mentions no names (letter, S, November 1910 / Qa'ada 1328; French account is in JP). The identification of Sidi Sherqi rests on the fact that a copy of the request, in his distinctive calligraphy, was found in Boujad. The calligraphy was identified for me by a retired official of the Ministry of Justice.

*** Preface

This book is intended as an anthropological introduction to the Middle East. This goal is inseparable from a second, complementary one, that of indicating the contribution which the study of the Middle East is making to the main currents of anthropology, especially those which relate to the analysis of complex societies. As anthropological scholarship on the major civilizational areas of the world has reached a critical intensity, certain themes have been more emphasized than others. In research on Black Africa in the 1940s and early 1950s, the nature of political order to be found in “stateless” societies was a predominant question. Much of the anthropological study of India has focused on the cultural and social aspects of inequality, and this literature has profoundly influenced the consideration of stratification and social class elsewhere.

Research on the Middle East is beginning to reach a similar critical intensity and several interrelated themes prevail. One group of problems is suggested by the study of Islam and the means by which a world religion is to be understood simultaneously as a universal ideological force and in its rich local manifestations. How does a world religion such as Islam maintain its vitality in rapidly evolving economic and political contexts, and how do local understandings of Islam affect the wider currents of Islamic civilization?

Another set of problems deals with ideas which people hold of their cultural identity. In a region as complex as the Middle East, with interlocking linguistic, ethnic, religious, kin, and class distinctions, the problems of how personal and collective identities are asserted and what they mean in differing historical and political contexts are especially crucial. Such distinctions are much more plastic than earlier stereotypes concerning their cultural bases have allowed.

A third emerging research focus concerns economic activities—the production and consumption of goods and services. At a general level, shared with other disciplines, this focus involves analyzing the social and cultural impact of developments such as massive labor emigration from poorer countries, the influx of oil and mineral wealth to others, urbanization and land reform, and the shifting circumstances of international politics. A specifically anthropological contribution to these issues concerns the analysis of the cultural values and systems of social relationships associated with forms of economic activity ranging from the Middle Eastern bazaar to “modern” forms of industrial and commercial activities and what happens to values and social relationships in the context of rapid economic and social change.

A fourth research focus concerns changing interpretations of Middle Eastern societies and cultures by Westerners and by Middle Easterners themselves. This problem, once regarded as an historiographic one related only indirectly to “real” anthropological inquiry, is now regarded as implicit in any problem in the human sciences. Ideas concerning what constitutes valid description and interpretation of any culture and society have changed dramatically over the last two centuries, especially as social science has ceased to be primarily a Western or European enterprise.

This book is intended both as a textbook and as an interpretative essay. It is a textbook insofar as it is intended as a self-contained book to introduce students and colleagues to the basic ethnographic themes of the Middle East and the theoretical questions that have been and are being developed by specialists in the region. Although this book is in part necessarily a synthesis of major research, I seek to develop a particular style of anthropological inquiry and show its contribution to the study of a region of complex civilization rather than provide an exhaustive review of the literature. Many textbooks are derivative and unconvincing in that they rarely convey the sense of discovery which leaps from the pages of the more extensive monographs which constitute the central substance of anthropological inquiry. I hope that this book contains enough of the sense of discovery that I have felt in creating it so that readers will be prompted to read'it in conjunction with some of the monographs and articles indicated in the footnotes. The footnotes to each section and chapter are designed to be a guide to further readings on particular topics, and for this reason no separate list of further readings is included. To enhance the value of this book as a guide to contemporary anthropological research, I have indicated the best available sources, even when they are in foreign languages. This is deliberately contrary to some of the established conventions of textbook writing. My purpose is to indicate the cutting edge of anthropological and related research for those who wish to pursue given topics.

The outline of this book first took form when I was asked to prepare a series on Middle Eastern anthropology for CBS-TV's "Sunrise Semester." As the title of the general series implies, these programs did not exactly reach a prime time audience, but writing them brought me directly in contact with the evasive "general" audience so often evoked but never clearly delineated by academics. I wrote for the series as I would for graduate and undergraduate students (in my own experience the distinction between writing and teaching for these two categories of students is often exaggerated because the critical talents of undergraduates are often not fully appreciated) and for anyone interested in the region and civilizations of the Middle East. From correspondence and conversations it gradually emerged that the decision not to seek to popularize by softening the edges of difficult problems was enthusiastically received by an audience wider than one interested simply in the Middle East or in how anthropology as a discipline can contribute to the study of complex societies. I have tried to use the same approach in this book.

In writing this essay, I have benefited substantially from the critical comments and advice of a number of colleagues and friends. Hildred Geertz of Princeton University read the entire manuscript with a critical intensity which enabled me to strengthen and clarify key points of the essay, especially the sections concerning kinship and cultural identity. Paul J. Sanfapon of the American Museum of Natural History also commented with insight upon the manuscript and coordinated key editorial tasks at a time when my absence from the country might have delayed the appearance of the book. My colleague Karen I. Blu at New York University provided timely and detailed suggestions on most of the manuscript. Jon Anderson, Richard T. Antoun, T. O. Beidelman, Vincent Crapanzano, Bouzekri Draiouiy, Christine Eickeiman, Clifford Geertz, Abdellah Hammoudi, Nicholas S. Hopkins, Michael Marcus, Kenneth Sandbank, David M. Schneider, and Delores Walters have also offered useful advice. Except where otherwise noted in the text, the maps have been prepared by Danny Comyetz. Numerous colleagues have generously ' allowed me to use photographs and other materials, and such assistance is acknowl

edged at appropriate places in the text. This book is dedicated to the late Abdul Hamid M. el-Zein, a friend who in his own work sought to make anthropology a self-renewing form of philosophical and social inquiry which could transcend the intellectual traditions of "East" and "West," an aspiration which I fully share.

*** Note on transliteration

One of the first books which I read on the Middle East was Carleton Coon’s Caravan. [1] As a beginning student of Arabic, I appreciated his careful transcription. It facilitated my identification of unfamiliar terms, and for languages that I did not speak it gave me a general idea of how words were spoken. In a time of publishing economies, the willingness of Prentice-Hall to allow the full transcription of terms from Middle Eastern languages, particularly Arabic, reflects a concern for editorial quality that can no longer be taken for granted. I have in general followed the conventions of the International Journal of Middle East Studies, although in deciding on how to transliterate colloquial terms I have attempted to follow the pronunciation of the area being discussed. For Arabic, the stroke over a vowel indicates it is lengthened: aas in ma, 7as in bean, and u as in noon; ay as in pay is a diphthong. The emphatic consonants (d, s, t, z, h) are indicated by dots under them; kh is pronounced as in Bach; gh as the r of Parisian French. The ^cayn has been rendered with a small, raised ^c, and the hamza, a glottal stop as in the Brooklynese “bottle,” with an apostrophe f). Often in spoken language, even in educated speech, the hamza is dropped; but I have included it in transliteration in those instances where it seemed necessary to do so. Except where otherwise noted, only the singular form of Arabic words is indicated, with -s added for plurals. Adjectival forms of many Arabic place names and words are indicated with an i at the end of the word, as in Arabic. Words and place names with common English forms appear as they do in English and are not fully transliterated. Thus Mecca, not Makka; Fez, not Fas; Quran, not Qur’an; Allah, not Allah; Islam, not Islam; and sultan, not sultan. Richard Bulliet of Columbia University has kindly checked the accuracy of transliterated Persian and Turkish words.

* Part I: Introduction

** 1. Anthropology and the Middle East

*** The Middle East Defined

The term “Middle East” appears clear when it is employed in general commonsense contexts, especially those which imply a contrast with other regions of the world. Yet scholars interested in the region are usually ambivalent about the term. The late Marshall Hodgson reluctantly conceded that of all the terms used to describe the area it was probably the best, but nonetheless proceeded to banish it from his majestic Venture of Islam in favor of a private terminology which he considered to be free of all traces of

Western ethnocentrism.[2] Another historian recently expressed dissatisfaction with the term in an article entitled “Is There a Middle East?” but concluded, after a useful excursus on the characteristics which unite and divide the region, that it remains the best term available.[3]

The specialist’s reluctance to speak of a “Middle East” without providing an extensive gloss on the term is due to the circumstances surrounding its origins. Just like older, more geographically limited labels such as “the Near East” and “the Levant” that remain in use, the term “Middle East” was not coined by inhabitants of the region. It originated with nineteenth-century European military strategists and thus is unabashedly Euro-centered. In the geopolitics of the English military, for example, the “Middle East” meant the command responsible for the region from the Nile to the Oxus; the lands to the east of the Oxus belonged to their Indian command.[4] In terms of civilizational boundaries such a division made little sense since it cut the historically united (or at least interacting) Iranian plateau in two, but after all the term was not coined with scholars in mind.

In contrast, the terms most commonly used to describe North Africa are more sharply defined, although once again this is largely due to the maimer in which the region was divided by European colonial powers. In the first place, the term “North Africa” should not be taken literally. It is almost never used by area specialists to include Egypt. It is generally taken to mean Morocco, Algeria, Tunisia, and Libya. For Arab-speakers this region is generally known as the “Maghrib,” a term which literally means the West and, more poetically, the land where the sun sets. This usage clearly indicates the geopolitics of an earlier epoch, that of the first waves, of Muslim invaders in the seventh and eighth centuries. The term “Maghrib” is popularly used in French as well, largely because the region, less Libya and a narrow mountainous zone in northern Morocco ceded by the French to Spain, was under French colonial domination until recent times. Even in this more compact region, the imposition of colonial boundaries created distinctions which are still significant even though the period of European colonial domination is over. The country known today as the Islamic Republic of Mauritania was considered by Arab geographers as part of the Maghrib and toward the beginning of the twentieth century also came under effective French rule. Yet because it was attached to French West Africa and administered from Dakar it is often considered not to be part of the Middle East, despite the fact that the majority of its population is Muslim and Arabic-speaking, and the country is a member of the Arab League. The Sudan, despite its large non-Muslim, non-Arabic-speaking minority, has no such difficulty in being considered part of the Middle East, but again this is largely due to the accident of spheres of colonial rule—it fell under Egyptian rule about 1830, and by the end of the nineteenth century was ruled by what was formerly an Anglo- Egyptian condominium.

In contemporary usage the “Middle East” is taken to encompass the region stretching from Rabat to Tehran, a distance of roughly 3,400 miles. This is equal to the distance from New York City to Fairbanks, Alaska. To give another indication of its vastness the Middle East includes territory on the three continents of Africa, Asia, and Europe (the European section of Turkey). When certain features of the linguistic, religious, political, and historical complexities of the region are emphasized, it is often extended to encompass Afghanistan,

Pakistan, and, at least in the recent historical past, the states of Soviet Central Asia that are heavily influenced by Islam.

TURKEY

In this broader sense the Middle East has often been characterized as a “mosaic.” Despite the popularity of this metaphor, it has significant drawbacks for the purposes of modern social anthropology, for it does little more than indicate the fact of significant internal regional differentiation. One of the basic arguments of this book is that the juxtaposition of a range of cultural and noncultural features in the Middle East does not in itself make the region unique. Such a “mosaic” characterization can be equally applied to the Indian subcontinent, Southeast Asia, the Balkans, and the Soviet Union, among other locales. Rather, it is the presence throughout the area of key cultural symbols and their variants and through shared historical circumstances that this region can justifiably be considered as a single sociocultural area.

In historical terms the area designated by this broader, contemporary usage of the term “Middle East” coincides roughly with the first wave of Arab invasions and with the three largest Muslim empires at their greatest extent—the Umayyad (661- 750), the early Abbasid (750-ca.-800), and the Ottoman as it was from the sixteenth through the eighteenth centuries. Geographically the region also shares common characteristics. As a whole, it is semiarid and characterized by the prevalence of irrigation agriculture and pastoral nomadism. However, it is not fully delineated by natural frontiers. Although the region is partially cut off from sub- Saharan Africa and from the Indo-Pakistani subcontinent by mountains and deserts, its present northern boundaries with the Soviet Muslim territories, for example, are more political than natural.

FIGURE 1-2 Muslims in the world today. Shaded areas: majority population; areas with tranverse lines: minority population. (Adapted from Aramco Handbook, rev. ed. [Dhahran: Arabian American Oil Company, 1968], p. 230.)

Seen in terms of social and cultural features, the boundaries of the Middle j East are more elusive. The region is closely identified with Islam and is where Islam

' won its first adherents, but thinking of it as a heartland of Islam can lead to a

distorted view' of Islamic civilization. Muslims today are situated in a wide band ; which ranges from Indonesia and the Philippines through the Indo-Pakistani sub- i continent, Soviet Central Asia, Iran, and Turkey to the Arabic-speaking regions of

the Middle East and North Africa and Black Africa. The epicenter of the total Muslim population lies between Iran and Pakistan, on the eastern edge of the area with which this book is concerned.

Similarly, Arabic is often thought of as the language principally identified with Islam and the Middle East, yet unless qualified this assumption also engenders : serious distortions, one of which is to diminish the role attributed to Persian culture

| in Islamic civilization. Although Arabic today is the principal language of the largest

part of the Middle East, this was not always the case. For a considerable period after the initial Islamic conquests of the seventh century, Arabic had still not become the principal language of either commoners or the indigenous elite of many of the conquered regions. Likewise, during the period of the hegemony of the Ottoman Empire from the fifteenth through the eighteenth centuries, Ottoman Turkish tended to be the principal lingua franca of the elite in much of the region. Persian was also commonly employed in a similar role in regions beyond those s where it is spoken today.

The majority of the region’s inhabitants are Muslim, but only occasionally has this fact provided a base of common sentiment and identity. Currently an ethnic irredentism based upon common language is on the upsurge in the Middle East as elsewhere in the world, but this was not always the case. Thus for over half a century the elite of Turkey have stressed their ties with Europe more than those with their Muslim neighbors. Egyptian elites prior to the 1950s, and again in this decade in certain contexts, stressed the Mediterranean identity of their country as much as its Arab or Middle Eastern identity. The same is true for the various countries of North Africa. Historians such as Fernand Braudel have persuasively j argued the case for considering the countries on both sides of the Mediterranean as a single society for extended historical periods.[4]

To sum up, despite its drawbacks, the term “Middle East” continues to be the most acceptable of available terms, provided that it is not taken unreflectively to indicate a homogeneity which the region does not possess, much as is suggested by i the misleading concept of the “Arab mind” which has recently resurfaced in some

i popular literature. Alternatives are occasionally introduced, such as the acronym

SWANA (South West Asia and North Africa), and justified on the ground that they ‘ are completely devoid of all historical, political, and religious assumptions. Yet all

such terms suffer equally from unfamiliarity. Furthermore, it is precisely the shifting cultural and historical realities that must be taken into account in any meaningful study of the region, whatever initial difficulties such complexities may offer. In any case, whatever the origin of the term “Middle East,” it is now employed in a fairly neutral, descriptive sense by Middle Easterners themselves and is used in the same way in this book.

*** Anthropology: Some Practical Assumptions

Anthropology as an academic discipline is notoriously difficult to define, yet a brief sketch of its nature is essential to indicate its unique contribution to the study of a region such as the Middle East. Many of the anthropological studies referred to in this book use specialized terms in different and occasionally incompatible ways. By indicating some of the broader theoretical issues which are implicit in such usages, these differences can be seen for what they are—references to broader intellectual concerns rather than being inconsistencies of writing or thought.

In an earlier, theoretically less reflective era, social anthropology was commonly—although imprecisely—defined as that branch of sociology most concerned with the study of small-scale, technologically simple, nonliterate societies. Now that sociologists, political scientists, economists, and historians rub elbows with anthropologists in the study of both complex and “simple” societies, such a casual division of labor—always a questionable one—is now fully inadequate. Hence two questions must be raised. The first concerns the nature of an anthropological study of a complex or simple society and the extent to which such a study can be differentiated from those of history and the other disciplines of the social sciences. A second issue, introduced here and implicitly answered by the structure of this book, is the means by which anthropological techniques developed largely in the context of the study of small-scale societies and small groups can contribute to the study of major civilizational areas. By specifying some of the central concerns of anthropological inquiry or, to be more precise, the style of anthropological inquiry developed in this book, I suggest a view of anthropology less heroic than a literal reading of our discipline’s name—the science of man—implies, but which at the same time more accurately represents its unique contribution to the human sciences.

The difficulty in defining anthropology reflects less a confusion on the part of its practitioners than the nature of anthropological inquiry itself. The discipline does not exhibit the features of what Thomas Kuhn calls a “normal” science. There is no clear agreement among its leading practitioners upon a central paradigm for research or upon the nature of the questions to be asked.[5] For this reason the discipline is intractable to ordinary textbook treatment. Indeed, it is one of the few major disciplines for which even the Educational Testing Service appears to have despaired, at least for the time being, of determining a body of orthodox knowledge for which competence can be measured by objective testing. To adapt Kuhn’s concepts to my immediate argument, anthropology is an anormal science.[6] In an anormal field of inquiry, competence in the discipline is acquired by joining its central debates at any given moment.

In England and the United States, anthropology has existed as a formal academic discipline only since the turn of the century but had been a clearly demarcated field of inquiry for several decades before then. Since that time, like the other human sciences, its central concerns have shifted. In the late nineteenth century, anthropology was closely linked with Darwinian concepts of human evolution, so that the techniques and data of what are today separate subdisciplines— social and cultural anthropology (then less grandly known as ethnography), linguistics, archaeology, and physical anthropology—were all loosely united. New frames of reference and methodologies have tended to draw these subdisciplines apart for many purposes although the departmental structure of most American universities still reflects the nineteenth century organization of the discipline.

The lack of a common central paradigm in anthropology makes it difficult to convey the concerns of the anthropologists, especially a sociocultural anthropologist, to nonspecialists. In 1950 Edward Evans-Pritchard, a leading British anthropologist, sought to depict the nature of social anthropology to the English public in a series of radio lectures. He began by admitting that for most persons, anthropology still conjures up hazy connotations of apes and skulls, primitive rites, and curious superstitions.[7] This image of anthropology is of course far from reality; although, given the lack of theoretical orthodoxy, hard and fast characterizations are difficult to make. Thus, the account of the discipline that follows should be considered as a set of working guidelines rather than dogma.

A cultural or social anthropologist studies contemporary or historically well- known societies and is concerned with describing, analyzing, and comparing patterns of order in them. Cultural anthropologists have tended to be concerned with the key symbols through which persons in a given society make sense of the world about them and proceed to act in it. Until the last two decades, this emphasis upon the study of patterns of meaning has been the dominant American contribution to anthropology. Social anthropologists have traditionally been more concerned with the study of regularities in observed social organization and in the ideas held by a society about such organization—how the domestic and public activities of social groups are organized and the consequences of this organization. A concern with such issues has been until recently a dominant

characteristic of British anthropology. It is true that the monographs of most anthropologists emphasize one concern or the other, but in practice the distinction that used to be made between social and cultural anthropology has become increasingly blurred in recent years as the practitioners of the discipline have begun to converge in their key theoretical assumptions. For all practical purposes, the labels of social and cultural anthropology are now interchangeable and are used to encompass more recent theoretical developments as well. My own preference is to use the term social anthropology to encompass what others now designate by the compromise term of sociocultural anthropology. I spell out these flexible usages to avoid unnecessary terminological confusion.

As an enthusiast of my discipline, I recognize that I am passing over several lively theoretical debates of the moment. I am doing this so as not to get bogged down in a technical discussion of the merits of Levi-Straussian structuralism, the nearly cryptological study of symbols favored by others, the reemergence of a somewhat musty evolutionary perspective to the study of society, or other sets of concerns. Instead, I briefly sketch the nature of the discipline as it specifically relates to the study of the Middle East, although throughout the text I refer to other approaches.

In the first place, anthropology, or at least a major tradition within it, is a human science—and as such shares many common features with history, the other major discipline through which the study of major civilizational areas is undertaken. Some anthropologists seek legitimacy for their enterprise by claiming that their goal is to develop universal “laws” of social organization or of cultural order which are somehow independent of specific societies or historical realities. Despite occasional programmatic essays proclaiming this goal, the enduring core of the discipline is contained in detailed, monographic studies of specific societies and cultures. Admittedly, one leading anthropologist, Edmund Leach, has written that he finds the details of ethnography dull, especially the details of other persons’ ethnographies. Yet he is also the first to admit that such details, and the means by which they are interconnected, are the essence of anthropological inquiry.[8]

Comparative studies of societies and cultures are possible on the basis of such ethnographic studies, but the order thus discerned is not of the sort discerned by the natural scientist. In some sciences, such as physics, chemistry, and geology, the patterns of order which are described and analyzed are the products of communication among fellow specialists. There is no question of their speaking with the objects of their study. In anthropology and the other human sciences, like history, the notion of objectivity acquires a special meaning, since the anthropologist must discern the meaning behind a social act in order to comprehend it. Briefly stated, humans are cultural animals. They communicate with others and comprehend the world through ordered, shared systems of symbols. Anthropologists are usually much more concerned with making explicit the underlying logic of these shared patterns of meaning and codes of conduct than are historians, but such patterns must be presumed to exist in the work of both disciplines.

The problem of making explicit such shared meanings has been called the “translation of cultures.” This problem is most vivid in working with the small- scale, relatively isolated groups which have traditionally been the concern of anthropologists, for in such societies such basic concepts as time, space, and person, along with other aspects of the nature of the social order, are likely to be substantially removed from our own concepts. At the same time, such notions are often so taken-for-granted that they usually are not fully expressed by those who share a given cultural tradition. Yet the explanation of such implicit concepts is central to making sense of other societies and cultures. Such problems of translation are just as real for anthropologists studying the rich, complex civilizations of the Middle East; although at first sight there is much more that is at least superficially known about shared patterns of meaning and social action in such societies. The same problem equally exists for a contemporary historian studying, for example, early nineteenth-century sectarian movements in upstate New York when he or she seeks to determine exactly what was the significance to audiences in that period of the frenzied descriptions of the terrors of hell contained in surviving written copies of sermons. In the New York case, the problem of translation initially appears less obvious, as the historian can “get by,” although imperfectly, through a substitution of contemporary attitudes. My point is that some set of hypotheses as to the underlying patterns of the social order must be made in order to render such evidence intelligible. Thus, the historian will seek systematically to state, what is known or knowable about the beliefs and the social order of the earlier period, just as the anthropologist does in the study of any contemporary society, including his own.

So far I have concentrated on the similarities between history and social anthropology. Both entail abstractions from social reality and the comprehension of the shared social meanings which constitute such reality. History differs from social anthropology in the type of abstraction which is made from this reality, although this is more a difference of degree than of kind. A common-sense way of conceiving history has been to consider it as simply a record of what happened in the past along with the discipline concerned in eliciting this record. Yet a moment’s reflection (as Malinowski was fond of saying) makes it clear that any coherent narrative concerning the past requires abstractions from reality. Sartre has aphoristically defined history as “the deliberate resumption of the past by the present” and thus captures at least part of the enterprise involved.[9] Whether the historian is concerned with the Battle of Algiers or the 1933 World Series, no account would be duller or less meaningful than one which naively attempted to gather all relevant documents while imposing no order upon them. The historian must sift through what is known of events and then abstract from them, discarding data that fail to contribute to a “story.” The historian’s primary goal is to elicit the circumstances that are unique to a given event or to a sequence of events. The resulting explanations only partially entail the determination of fact: The more difficult issue, as the French sociologist Raymond Aron has emphasized, is in deciding the best way of arranging the facts to make them intelligible. Unlike scientific explanations, which can be tested and confirmed through success with parallel cases, historical explanations cannot be tested in the same way. Instead, the best historical explanation is the one which is “most consistent, plausible, and in accordance with all the evidence.”[10]

The historian may seek primarily to explain specific events but must still rely upon sociological (or social anthropological) abstractions about the nature of religious beliefs, political relations, and the like in a given society in order to proceed with his narrative. The goal of the social anthropologist is complementary to that of the historian in that the social anthropologist is primarily interested in attempts to elicit and to confirm recurrent regularities in a society—such as the relation of certain systems of belief to social action, the nature of symbol systems, and the relation of types of political authority to various ideas of social inequality. Such explanations are closely intertwined with the understanding of specific historical events. Raymond Aron has gone so far as to say that the job of the sociologist—and sociology as he uses the term encompasses social anthropology as well—is "to render social or historical content more intelligible than it was in the experience of those who lived it."[11]

The relation between history and social anthropology has often been obscured by theorists who presume that because historical and sociological explanations are separable as ideal types, the actual work of historians and sociologists is equally separable.[12] Even a casual comparison of key monographs in social anthropology and in history indicates that the two forms of explanation are necessarily complementary. Marc Bloch's Feudal Society contains long sections on the ideas of fealty and kinship and notions of equality and hierarchy in the social order of Europe over a specific historical period that are as sociological in character as similar passages in Edmund Leach's Political Systems of Highland Burma.[13] At the risk of shocking my anthropological colleagues, I think that Bloch's study can even be considered the superior of the two studies because the nature of his documentation is more carefully described and integrated into his principal conceptual argument, while the argument in Political Systems, for all its iconoclastic brilliance, is more crudely drawn.

Some forms of anthropological explanation at first appear to fall outside the general framework sketched above, such as the seminal example of "pure" symbolic analysis provided by David Schneider's American Kinship: A Cultural Account.[14] [] For the sake of clarity, Schneider deliberately set aside questions of historical development in order to concentrate upon the logical interrelations among the key cultural symbols of kinship. Such an approach does not deny the importance of historical context. Moreover, as Schneider emphasizes, the style of analysis which he used to delineate relations among the key symbols which define ideas of kinship in American culture can be applied to other cultures as well—many such studies now have been carried out—but the direct comparisons of symbols and clusters of symbols about kinship in two or more societies does not lead to any meaningful generalizations which can be applied to cultures in general. A comparison of American cultural ideas of kinship with those held, for instance, by Moroccans facilitates an understanding of what is unique and distinctive about ideas of person and of relationships among them in each case. Such implicit and explicit comparisons are, of course, also used by historians in making sense of their data.

So far I have discussed the nature of historical and sociological explanation in general, but I have not indicated what is distinctly “anthropological” about anthropological research. In terms of the theoretical base upon which anthropologists draw, there is little that is unique to our discipline or to any of the other social sciences. All draw equally upon the works of Marx, Weber, Durkheim, Simmel, and their successors. As I indicated earlier, the study of distinctively “primitive” societies is no longer the hallmark of the discipline, nor is the intensive research technique called “fieldwork” exclusive to us. Yet, because anthropologists emphasize fieldwork as a principal technique, a description of anthropology in terms of what anthropologists do may facilitate distinguishing it from neighboring disciplines.

To prepare for fieldwork, in addition to immersion in anthropological monographs and sociological theory, an anthropologist characteristically, or at least ideally, spends several years learning the language and history of a region. Fieldwork itself generally lasts for a year or two and concentrates upon a particular small-scale group or groups. Evans-Pritchard’s definition of anthropology as that branch of sociology concerned with small-scale societies is now dated, although it reflects the primary concern of the discipline until the early 1950s. The reason for this emphasis on small-scale, “primitive” societies was that in them most significant social relations were assumed to be face-to-face and geographically self-contained. Under these circumstances it was easier for the anthropologist to see the links between institutions—family and kinship relations, friendship and patron-client ties, land tenure, inheritance rules and practices, religious rituals, beliefs, politics, and, most importantly, the shared symbolic conceptions of the world that underlie these various forms of behavior.[15] On the basis of the intensive study of such societies (or, increasingly today, of small groups within larger societies), the anthropologist then proceeds to the hardest job, that of creating out of the record of research a coherent representation of a society and the general principles of order within it. More self-consciously than most historians, the anthropologist relates this task to general theoretical issues.

Now that anthropologists are, or try to be, as much at home in cities, towns, villages, and regions encapsulated within modern and complex societies, as in the rapidly disappearing isolated and small-scale societies, the question of how the microsociological technique of fieldwork—the intensive, totalistic study of social forms—contributes to understanding larger units of society becomes more pressing than when they could claim the study of certain types of society for their own. How can the microsociological study of an anthropologist contribute to the understanding of larger entities such as nation-states? As Clifford Geertz has asked with characteristic irony: “Are the petty squabbles of barnyard notables really what we mean by politics? Are mud huts and goat-skin tents really where the action is?”[16] Is there not the danger of getting lost in “mindless descriptlvism” in the study of a pilgrimage center in Morocco or a tribe in the Yemen, or at least of learning more about these entities than one really wants to know?

A constant theme of this book is to demonstrate that anthropologists, or most anthropologists anyway, study specific places not for themselves or for the love of minute description of routine events in exotic places, but in order to learn something beyond them. We do intensive analyses of political, economic, symbolic, and historical processes on a

small scale. Like all other disciplines in the social sciences, we use our data as a means of making hypotheses about larger wholes. As Geertz emphasizes, the question is not whether we generalize—any science generalizes—but how we generalize. And that is important. In the human sciences, the microsociological technique of anthropology offers an alternative to the tendency to speak of tribe and peasants, of rulers and ruled, as if they were stock characters in a sociological morality play.[17]

Anthropologists are particularly concerned with eliciting the taken-for- granted, shared meanings that underlie conduct in given societies and are so familiar

a part of routine that they are taken to be “natural.” It is against such undramatic backgrounds that citizens participate in nation-states or have contact with the governments of such entities, or even form a part of such governments. The petty squabbles of barnyard notables, as Geertz says, may not in themselves be of compelling interest, but they frequently offer a more advantageous means of determining the components of a political style than do the more formal and generally less accessible deliberations of parliaments and cabinet meetings. The link between the unit of the anthropologist’s study and the larger whole is not that of microcosm to macrocosm—as an earlier generation of community studies often naively assumed— but merely that of an arena the study of which permits the elaboration of hypotheses about • certain social and cultural processes. Through the study of such mundane events as patterns of naming, seeking a husband or wife, the ways in which sickness is cured, the selling of a sheep, local elections, and religious ceremonies, anthropologists seek to grasp what is distinctly Moroccan about Moroccan markets, Lebanese about Lebanese political factionalism, Alevi about Alevi conceptions of Islam, Omani about Omani notions of honor, or Egyptian about Egyptian styles of etiquette and deference. Even the citizens of nation-states find themselves living most of their lives in the sets of microcosms that make up such larger entities. The microsociological perspective of the anthropologist can often provide valuable i insights into just how participation in such larger entities is experienced.

j To sum up the argument so far, social anthropologists and historians pursue

styles of explanation that are complementary and interchangeable in many respects. Just as in history the search for universal laws devoid of specific content leads only to trivial or false generalizations, similarly the search for laws in social anthropological research is unfruitful. Yet, through comparison of different societies and cultures and through careful attention to technique and theoretical assumptions, anthropologists seek an understanding of what is distinctive about general processes operating in specific historical and culture settings. Some anthropologists conduct research within less comprehensive but nonetheless useful theoretical frameworks. Cultural ecologists, for instance, are primarily interested in the relations between individuals and their environment in societies that generally are technologically simple and for such a purpose do not require a broader theoretical base. This book makes reference to such approaches in appropriate contexts.

Having briefly stated what is characteristic of the anthropological approach to the study of society, we now consider the ways in which this approach contributes to an understanding of the Middle East and the particular anthropological themes most fully developed in the study of the region.

*** First Approximations

Not long after the French Protectorate over Morocco began in 1912, a popular scholarly literature on Islam and on Arabs in that country began to flourish in the French language. By the 1920s the production of popular books on Islam and Morocco had become a minor industry, so that Georges Hardy, a prominent colonial administrator of the period, was able to publish a synthesis of the vast literature. Hardy's chapter on Moroccan "character" gives some indication of the approach which was used to grasp the "mysteries" of the Orient of which Morocco was considered a part. Hardy juxtaposed a series of contrasts: Moroccans were said to be both individualistic and gregarious, anarchic and despotic, intellectually lethargic and avidly pragmatic, serene and impulsive, reliable and fickle, artistic and uncreative, Muslims and animists, morally scrupulous and evasive.[18] An equivalent juxtaposition of opposites was used to describe such mundane things as climate and geography.

A consideration of these earlier colonial images of Morocco is important because of their influence on later attempts to characterize the Middle East as a whole. Carleton Coon, who wrote the first general anthropological survey of the region, lived and worked for extended periods in Morocco in the 1930s. When he came to write the first edition of Caravan in the late 1940s, he used the image of the mosaic, implicit in earlier writing on Morocco, as his guiding metaphor in order to highlight the geographic, linguistic, religious, and ethnic complexities of the region in general.[19] In a descriptive sense the mosaic metaphor is useful, although its major shortcomings are discussed in Chapter 3.

The object of the rest of this chapter is to indicate some of the general characteristics of the Middle East, beginning with certain geographic factors. This is because, at least traditionally, geographic factors have formed broad constraints within which the societies of the Middle East have developed.

As a whole, the Middle East can be characterized by three basic geographical features: It is semiarid (although there are local exceptions to this condition); it is a region which since antiquity has been one of agriculture (since at least 8000 b.c.) and empire; and, as mentioned earlier, it lacks sharply defined natural boundaries, so that it has always been accessible to conquest by land and sea, and it has long served as a crossroads of long-distance trade. Of course, the same is true of most other major sociocultural regions of the world. These characteristics thus do not serve to distinguish the Middle East from other

major sociocultural areas, but they do constitute major factors of relevance to historical developments and the kinds of lives lived in the region.

As Figure 1-3 indicates, few places in the Middle East receive the forty to fifty inches of rainfall which is characteristic of the eastern United States and the richer agricultural regions of Europe. Some coastal and mountain areas receive up to twenty inches annually, but many other regions receive as little as four to eight inches annually (Saudi Arabia) or less than one inch a year (southern Egypt). Rainfall-fed, or nonirrigated, farming is possible only in relatively narrow belts of Syria, Turkey, Lebanon, Iran, Jordan, and the countries of the Maghrib. Even in these cases, the amount of rain varies substantially from year to year and radical annual shifts in rainfall and climatic conditions are the rule. Where there is heavy rainfall, as in the Rif mountains of northern Morocco, the soils are often too poor to permit regular, adequate agricultural yields.

FIGURE 1-3 Rainfall in the Middle East.

FIGURE 1-4 Population density of the Middle East, c. 1970.

Nonetheless, agriculture is important throughout the region. By 1970 figures, over 95 percent of the Middle East’s rural population is sedentary and lives from agriculture, although only 14 percent of the total land surface is arable.[20] Thus the popular image of the Middle East as nomads traveling between oases on the desert is misleading. To a large extent, however, agriculture is dependent upon irrigation. A glance at the population map of the Middle East indicates how dramatically many of the centers of population cluster around sources of water for agriculture. Thus for Egypt, cultivation is confined to a few miles on either side of the Nile, although on the Nile Delta and in Iraq between the Tigris and Euphrates rivers, there are intricate webs of irrigation channels that support relatively dense populations. Elsewhere throughout the Middle East there are other sorts of irrigation systems, both traditional and modern, adapted to local circumstances. Wells often are a source of water, although in Iran and in regions of Morocco such as Marrakesh, there are elaborate underground canals (called ghattara in Morocco, qariat in Iran, and aflaf in Oman) that carry water from underground streams in nearby mountain regions to the rich oases of the plains. Modem technology has greatly expanded the regions that have been brought under cultivation.

Because it is semiarid, large parts of the Middle East traditionally have been given over to a mode of livelihood that combines the extensive seasonal cultivation of crops such as wheat and barley with semitranshumant pastoralism, especially of sheep and goats. Pastoral nomadism as the sole or predominant activity of certain groups to the full exclusion of cultivation is today relatively rare; although when considered together with transhumant pastoralists, nomads still form a significant (although rapidly declining) minority in such countries as Saudi Arabia (probably between 11 and 20 percent), Iran (10 percent), Afghanistan (16 percent or more), and less than 5 percent of the population of the countries of North Africa, with the exception of Libya and Mauritania. Only in Somalia have nomads until recently constituted a majority of the population (about 75 percent in the early 1970s). [21]

The significance of transhumant pastoralists and nomads has often been exaggerated as a factor in Middle Eastern history. Nonetheless, such groups have traditionally constituted political and military threats to effective central government in many regions, including Morocco and Iran. From at least 1S00 to 1917 the Iranian polity was to some extent limited by the power of pastoral tribal groups. In the case of Morocco it was not so much the strength of pastoral groups as the strength of tribally organized societies, not necessarily pastoral, that limited the control of the central government until the effective imposition of the Protectorate.

Most Middle Eastern countries also possess mountainous regions—Kuwait and certain other Gulf states are some of the few exceptions. From premodern times to the present these regions have served as zones of refuge from central government control. Thus the Kurds of Iraq, Iran, and Turkey have been able to preserve a degree of autonomy, and Berber-speaking tribal groups in Algeria’s Kabylia mountains and Morocco’s Rif and Atlas mountain chains have managed to do so until the relatively recent past.

Traditionally, the Middle East may have been a region of irrigation agriculture and pastoralism, but for many of the countries of the region a significant mineral wealth, especially in oil, has created the potential for significant economic growth. Revenues from such resources have dramatically increased in recent years and have made possible substantial alterations in the social and material life of some of the region’s inhabitants, especially in the cities.

The Middle East is a region of intense urban and commercial life, with ancient cities as Damascus, Cairo, and Istanbul, as well as those of much more recent origin, such as Riyadh and Casablanca. Over 40 percent of the region’s inhabitants were urban dwellers in 1970, as opposed to roughly 10 percent in 1900.[22] The transformations occurring in these cities are not unique to the Middle East. The rapid rate of urbanization, for instance, is occurring throughout the Third World. In the chapters of this book concerned with the nature of cities these more general trends are considered, but the emphasis is upon the extent to which certain features of urban life continue to make these cities distinctly Turkish, Egyptian,

Muslim, or Middle Eastern and how these culturally unique attributes influence and are affected by more general processes such as population growth and world economic currents.

In terms of religion, the Middle East as a whole is predominantly Muslim. One of the major issues that must be faced is how a world religion such as Islam has remained a vital force for over a millennium in such a wide range of cultural and social contexts. Islam has retained its significance because of its capacity to be reinterpreted in a variety of ways in different cultural contexts and in different strata of society. The mosaic metaphor sufficiently indicates some of these major contrasts in belief and ritual; although by and large this has not led to a more analytic consideration of their implications.

The Middle Eastern mosaic also contains significant Christian and Jewish minorities, with the obvious exception of the state of Israel in which Jews constitute a majority of the population. To consider Christians first, roughly 8 percent of Egypt's population is Christian (mostly Coptic), 20 percent of Syria and Iraq, and perhaps 40 percent of Lebanon. Exact statistics on the size of this minority are hard to obtain, especially in the case of Lebanon, where no census has been conducted since 1932 in an effort (which largely succeeded until 1975) to preserve a delicate political balance between various ethnic and religious groups: Maronite Christian, Armenian Greek Orthodox, Greek Catholic, Sunni Muslim, Shi^cT Muslim, Palestinian Christians and Muslims, Druze, and other smaller groups. A significant question in this book is to determine precisely how such complex ethnic and religious identities are socially maintained in various situations.

Most bf the countries of the Middle East have also possessed significant Jewish minorities, with the exception of Saudi Arabia and the states of the Persian/ Arab Gulf (which, however, have Hindu minorities). Jewish communities contracted in size after the creation of the state of Israel in 1948 and (more significantly in terms of sheer numbers) with the collapse of the colonial regimes of North Africa in the 1950s and 1960s and, in the east, the Iraqi revolution of 1958. Sizeable Jewish minorities remain, however, in Iran, Turkey, Tunisia, and Morocco. Another significant minority in many of the countries of North Africa were colonial settlers, who were predominantly, although not exclusively, of French, Spanish, and Italian origin. Elsewhere in the Middle East there have traditionally been thriving Greek and Armenian communities, especially in Egypt and Turkey, although since the beginning of this century their numbers have considerably diminished.

The major language groups of the Middle East have already been mentioned, but in many areas a number of languages and dialects of more limited scope also exist. In a small town of 12,000 inhabitants in northwestern Turkey recently studied by an anthropologist, virtually the entire population spoke mutually intelligible dialects of Turkish, but the older generation in the town continued to speak Circassian and Georgian.[23] Kurdish is widely spoken elsewhere in Turkey, which also has an Arabic-speaking minority. In northern Iraq, there is a bewildering array of ethnolinguistic communities: Kurdish-speaking gypsies, Kurds, Arabic-speaking pastoralists, and a range of groups with finely distinguished religious, ethnic, and

linguistic identities. Similarly, in many border areas of the Middle East, such as between Iraq and- Iran, most of the population is bilingual—Arabic and Persian in the case of the southerly portions of that particular border and trilingual (Arabic, Persian, and Kurdish) along its northernmost sections.

Similarly, there are large Berber-speaking populations in North Africa, although most of these are becoming increasingly bilingual in Arabic. In other regions, such as Egyptian and Sudanese Nubia, most of the male population is bilingual in Arabic and a Nubian dialect, although use of the Nubian dialects is rapidly becoming limited to domestic contexts.[24]

FIGURE 1-5 Middle Eastern languages.

on

European languages, especially those of the former colonial powers in certain regions, continue to be important in large parts of the Middle East. Arabic is the national language in all the countries of France’s former North African colonies, but the urban educated population is predominantly bilingual in French and in Arabic. Algeria, Tunisia, and Morocco all have adopted official policies of Arabization; yet, after over two decades of independence in Morocco and Tunisia and a slightly lesser period for Algeria, many sections of the government bureaucracy continue to be run primarily in French. The French language remains significant in the schools as well, although Arabization at the elementary and secondary levels is progressing. A network of French educational institutions formally intended for the children of the remaining French still exists, although a number of children from elite North African families also attend these institutions. In the government-run schools French also continues to be important as a secondary language.

To sum up this section, I have tried to indicate enough of the dimensions of complexity in the Middle East to make it clear why expansive generalizations about the region are not always possible. General themes in social anthropology, such as inequality and the interconnection between religious belief and social forms, can be explored in the various societies of the region, but for reasons already discussed, no one part of the region can be taken as a direct

microcosm of the others. In what way, then, can this book be said to encompass the Middle East as a whole?

The approach of this book is not encyclopedic, and I shall not attempt to cover equally all the countries of the Middle East. For reasons of historical accident and rapidly shifting political climates for research, American, European, Iranian, Arab, and Turkish anthropologists have been better able to conduct field studies in some areas than in others, just as the historical development of some countries has focused attention on specific issues. Thus many of the anthropological studies of Turkey by both indigenous and foreign researchers have concentrated upon the themes of modernization and nation-building, while those of North Africa have been intensely concerned with various aspects of the continuing impact of the colonial experience. Even if the various countries of the Middle East were equally known through anthropological studies, there would be little point in attempting a direct synthesis of these materials, any more than such an effort for Africa or Latin America would be intellectually rewarding. In general, my procedure will be to develop specific topics on the basis of the best available documentation for a particular country or region and then to sketch as far as possible how such patterns of kinship, political comportment, and the like compare with similar patterns elsewhere in the Middle East. For example, Chapter 4 discusses nomadism, especially through an examination of the Basseri of southern Iran and the Al Murra Bedouin of Saudi Arabia. They are chosen not because they represent a “lowest common denominator” typicality for all nomads of the Middle East, but merely because they have recently been the subject of anthropological studies which are sufficiently detailed to form a base for understanding pastoral activities elsewhere and for a discussion of the role of nomads and of tribal societies in the premodem, preindustrial past.

My purpose throughout this book is not simply to convey information, but to convey a manner of thought. The language of social anthropology is not quite so laden with technical jargon as is the language of the other social sciences. This has the handicap in some circles of making our style of inquiry initially appear like a codification of the obvious, but it is often the “obvious” assumptions about cultural conduct and social forms which appear so familiar that they become almost impermeable to analysis. I seek to indicate how the specifically anthropological approach to the study of the Middle East has contributed both to an understanding of the region and to the principal intellectual currents of the discipline.

** 2. Intellectual Predecessors: The Rediscovery of the Middle East

Academic chairs in anthropology were created in England and the United States only at the turn of this century. Yet from the beginning of the nineteenth century several styles of inquiry converged which emphasized issues that later became central to our discipline. Standard accounts of the proto-anthropology of the last century correctly emphasize its

association with Darwinian theories of evolution and curiosity about primitive peoples, but admittedly these concerns were only marginally pursued in Middle Eastern contexts. Still, the Middle East and a rather diffuse concept of “Oriental” society had a significant impact upon some of the main theses developed by leading sociologists, including Karl Marx, Max Weber, and Emile Durkheim.

The purpose of this chapter is not to hunt for distinguished ancestors who fit contemporary notions of anthropological thought. Instead, through the use of key examples I Will indicate some of the principal intellectual currents and geopolitical circumstances that gave impetus to sociologically oriented accounts of the Middle East in the last century. The scholars whose work I discuss share, in varying degrees, three common features with modern social anthropologists: (1) They considered the study of the contemporary social order significant to their research, even when their primary goal was the comprehension of remote or “classical” historical periods; (2) they considered it important to describe and comprehend the ordinary activities and taken-for-granted conventions of daily life and sought to do so through direct and prolonged contact; and (3) they consciously made systematic observations (especially in the latter half of the century) and sought to make explicit the principles on which their inquiries were based. A significant number of studies of the Middle East in the nineteenth century do not conform to the passionately argued yet curiously ahistorical attempt to portray earlier scholarship provided by Edward Said’s Orientalism,[1] and it is these studies which this chapter seeks to evaluate.

There were three main reasons for the growing European interest in the Middle East in the nineteenth century. First was a general curiosity about the customs of peoples elsewhere, but particularly those of the Muslim Orient. From the late seventeenth century, the Muslim Orient had been used as a screen against which European fantasies about the primitive or the alien “other” were projected against an often imaginary geography. This is in part reflected in the vast scope of the emerging field of “orientalism,” which included everything from Islamic society to the civilizations of India, China, and Japan. This interest was popularly reflected in a number of ways. Moors, Turks, and Persians characteristically appear in operas of the period; artists such as Delacroix romantically depicted what they considered to be the private life of Islam. Successful, if inaccurate, books such as Washington Irving’s Mahomet and His Successors[2] or more imposing artifacts of intellect such as Ernest Renan’s “Islamism and Science” offered a general theory of the “decay” of Muslim civilization in contrast to the vitality of the West.[3] By the mid-nineteenth century, travel to the Middle East, at least to the major cities, was no longer considered hazardous. Novelists such as Thackeray visited the region, and the reading public insatiably followed accounts of such travels.[4] Later in the century this fascination with the Muslim world merged, at least among the British, with the romantic notion of the pure Bedouin nomad as a primitive contemporary with the virtues of a Victorian gentleman. Anachronistically, this strand of attraction to the Middle East might be called the “T. E. Lawrence syndrome.”

Such romantic assumptions toward the Islamic Orient were undeniably important in sustaining a scholarly and popular interest in the area, and some travel

'See Edward W. Said, Orientalism (New York: Pantheon Books, 1978) (best and more accurate on the period prior to the nineteenth century); also Bernard Lewis, “The Study of Islam,” Encounter, 38, no. 1 (January 1972), 31-41. For a more general essay on the European image of non-Europeans in this period, see Henri Baudet, Paradise on Earth (New Haven and London: Yale University Press, 1965), pp. 42-53. Finally, for a convincing essay which breaks with scholarly convention and looks at Islamic civilization as an integral part of the past of the West, see F. E. Peters, “Islam as a Western Civilization,” The Arab World, 18, no. 3 (May- June 1972), 13-19.

[2] Washington Irving (1783-1859), Mahomet and His Successors (New York: Putnam’s, 1868). Equally indicative of the kitsch literature concerning the Muslim Orient is Washington Irving’s Legends of the Alhambra (Philadelphia and London: J. B. Lippincott & Co., 1909).

[3] Renan’s essay can be found in his The Poetry of the Celtic Races and Other Studies, trans. William G. Hutchinson (London: W. Scott, Ltd., 1896). An essay on the life of Muhammad can be found in Renan’s Essays in Religious History and Criticism, trans. O. B. Fro- thingham (New York: Carleton, 1864), pp. 226-84.

[4] William Makepeace Thackeray (pseud. M. A. Titmarsh), Notes of a Journey from Comhill to Grand Cairo (New York: Wiley and Putnam, 1846).

accounts, such as Charles Doughty’s Travels in ArabiaDeserta (1888),[25] presented valuable and precise ethnographic data, although they were not intended as ethnographies. In the hands of latter-day anthropologists, such accounts have been invaluable in reconstructing the social organization of nomadic tribal societies prior to the ; effective imposition of modern state controls.

j A second reason for attention to the Middle East in this period was a

heightened imperial interest in the region. It was considered as both a fertile ground

; for the enterprises of European financiers and ripe for direct political control,

t Bonaparte’s expedition to Egypt (1798-1801) brought Egypt under French rule for

f a brief period. Completion of the Suez Canal in 1869 began a period of rapidly growing European interest in the country, which culminated with English occupation in 1882,-and the addition of the Sudan (technically an Anglo-Egyptian condominium) shortly thereafter. As for North Africa, Algeria was occupied by France in 1830 and ultimately was legally considered to be an integral part of the metropole; Tunisia was made a protectorate in 1881; Morocco in 1912. If indirect forms of domination are included, such as the presence of British political advisers to the Trucial States of the Arab/Persian Gulf from the early nineteenth century onward to protect imperial lines of communication to India, then the magnitude of European political interest in the region is emphasized even more. In the years following the First World War, direct European control (or control by mandate) over the countries of the Middle East expanded to encompass Libya (Italy), Syria and Lebanon (France), and Palestine and Iraq (England).

Finally, an interest in the Middle East converged with important trends in European scholarship , particularly in the so-called “higher criticism” of the Bible which was then emerging in Germany and later prevailed in other scholarly circles. As Bernard Lewis has written, one reason for this was a Jewish sympathy with Islam. As religious anti-Judaism gave way to a racially expressed anti-Semitism, some Jewish scholars looked to other Semites for comfort. This affinity, Lewis says, was largely imaginary but accounted for part of the interest in Islam.[26] In addition, several prominent scholars trained in ancient and modern Semitic languages became explorers and ethnographers because they saw such research as necessary for the understanding of society in the time of the Old Testament patriarchs.

*** Bonaparte’s Expedition to Egypt, 1798-1801

Bonaparte’s expedition is often used by historians to symbolize the point at which the Muslim Orient, forced to recognize growing Western hegemony, was compelled to acquire Western technology, especially military, and ultimately was to be profoundly shaken by contact with all aspects of European civilization. Here I am concerned with the inverse process, the European scholarly rediscovery of the Islamic East. (I specify “rediscovery” because at least until the final collapse of Islamic rule in Spain in the fifteenth century, Europeans had recognized the intellectual supremacy of the Muslim world in many fields.) Scattered throughout the ships in Bonaparte’s fleet were 150 scientists and Orientalists, scholars whose task was to make as systematic an inventory of Egypt as possible—its geology, rivers, minerals, antiquities, and, of most concern in the present context, the “manners and customs” of its inhabitants. The motivation for the latter was the hope that insight into contemporary society, especially that of the peasants, might provide clues as to the social order of Pharaonic times. The implicit assumption was that peasant society was profoundly conservative and resistant to change. (Parenthetically, the notion that the study of the present is primarily valuable as an indication of the past dies very hard. For example, it still dominates the popular understanding of what anthropologists do.) In any case, the findings of the scholars accompanying Bonaparte were collected in the massive, meticulous, twenty-four volume Description de I’Egypte (1820).[7] Even if its ethnographic section was not always as accurate as the sections on geology and natural history, its authors aspired to the same high standards. In the later French colonial conquests in North

Africa, an initial byproduct of conquest was the compilation of similar inventories of the new domains. The strength of the surveys of Algeria and Tunisia rests more on an inventory of the physical characteristics of the two territories than in an understanding of their populations. Nevertheless, they indicate in a perfunctory manner the nature of indigenous political activities and institutions.[8] In contrast, the monographs written on Morocco just prior to and in the early years of the protectorate constitute one of the best collections of colonial ethnography to be found anywhere. One reason for the quality of this research in contrast to most of that conducted in Algeria was the conscious decision on the part of the French, at least in principle, to preserve and enhance indigenous institutions. Another clear impetus was the notion that rational, systematic ethnographic inquiry would facilitate the "scientific" implantation of colonial rule. This tendency to regard the exercise of colonial rule as a science was already present at the time of Bonaparte's expedition to Egypt.

Another significant aspect of Bonaparte's invasion of Egypt was the attempt to legitimize the colonial enterprise in the eyes of the conquered population—a theme to be developed at greater length in a later chapter. On one of the expedition's ships was an Arabic printing press looted from the Vatican. This was used to print a proclamation, translated into Arabic by an Orientalist, announcing that Bonaparte had come in the name of Islam and would govern in a more Islamic fashion than had the preceding corrupt Mamluk regime. The invading troops were ordered to be scrupulously respectful of mosques. Bonaparte even dressed as a . Muslim and prayed in mosques for a time, until the ridicule of his troops forced him to abandon the practice.[27] What is crucial about such actions is that they prefigure later, more systematic, attempts of colonial regimes to legitimate their presence in the eyes of the ruled and whenever possible to win over key elements in indigenous society. Ethnographic investigation was seen as an important contribution to this aspect of the colonial enterprise.

[7] Description de l'Egypte (Paris: Editions d'Art Albert Guillot, 1966).

[8] Interest in ethnographic inquiry during the colonial era in Algeria was directly linked to political conditions. For example, in periods of sustained local resistance to French rule, there was an increase in ethnographic investigation of political and religious topics. This interest waned when French rule was thought to be secure. For a useful account of changing styles in the ethnography of Algeria, the one country for which a detailed ethnography of ethnographic styles has been made, together with representative texts, see Philippe Lucas and Jean-Claude Vatin, L'Algerie des Anthropologues (The Anthropologists' Algeria) (Paris: Maspero, 1975). Despite this book's occasionally simplistic tendency to correlate styles of inquiry directly with socioeconomic "interests," its basic argument remains plausible.

*** Explorers and Scholars

There was a special class of explorers whose works are particularly useful in tracing the rediscovery of the Middle East—those who could -speak the languages of the region and who, through long residence in it, could describe its society with reasonable accuracy. One of the best known was the polyglot Sir Richard Burton (1821 - 1890), who began his career in the Indian Army. After seven years he was forced to resign because of a firsthand report he had made in confidence to a superior regarding the organization and use of male brothels in Karachi. This report created a scandal when one of his rivals caused it to be made public, and the incident forced his resignation. Subsequently he traveled to and wrote extensively on South America, Utah, Central Africa, East Africa, and the Arab world, the last of which ! specifically concerns this study.

Perhaps the best of Burton’s books is his account of a pilgrimage to Mecca in 1853. Like most travelers of the period, he adopted oriental dress, in his case i Persian costume and the name of Mirza ^cAbdallah, an identity he had previously

f assumed with success in India to conceal his European origin. Although Europeans

in the Middle East commonly adopted oriental costume, not all felt compelled to conceal their identity as Europeans. But, then, Burton’s attitudes toward “orientals” generally displayed an arrogance and hostility which exceeded even the prevalent Victorian notions of English superiority over other races and nations. Burton’s writings emphasize the safety of travel in Egypt, yet he refers to Egyptian society as being somewhere between “barbarism” and “civilization.”[28] He offered the following advice on the orient: “The more haughty and offensive [the traveller] is to the people, the more they respect him; a decided advantage to the traveller of

FIGURE 2-1 Sir Richard Burton (1821-1890) dressed as Mirza °Abdallah. (From Richard F. Burton, Persona! Narrative of a Pilgrimage to Ai- Madinah &Meccah [London: Tylstonand Edwards, 1893], frontispiece, vol. 2.)

choleric temperament.”[11] Elsewhere he rails against what he calls “Asiatic” governments—those that can be dealt with only “by bribe, by bullying, or by bothering them with a dogged perseverance into attending to you and your concerns.”[12] Given his attitude toward his fellow travelers on the pilgrimage, it is not surprising that his hostility was often reciprocated.

As fascinating as it is to read Burton’s account of his pilgrimage, the book reveals more of the author than of the nature of Islam or of the Muslim countries through which he traveled,

despite its literary array of erudite footnotes, digressions, and incidental geographical and ethnological observations. To his credit, Burton was conscious of this aspect of his narrative style: “I make no apology for the egotistical semblance of the narrative. Those who felt the want of some ‘silent friend’ to aid them with advice, when it must not be asked, will appreciate what may appear to the uninterested critic mere outpourings of a mind full of self.”[29] The very title, A Personal Narrative, specifies the nature of the text.

[11] *Ibid*., p. 15.

[12] Ibid., p. 20. The theme of the inherent corruption and decay of “oriental” governments is a common theme in the literature of the period, although such claims should not be taken at face value. It runs throughout Alexander Kinglake’sEothen (London: Icon Books, 1963 [orig. 1844]), an excellently written account describing the author’s travels through the Ottoman domains of eastern Europe to Syria, Palestine, Egypt, and return, in a period when the plague ravaged the entire region. Although Kinglake spoke virtually no Arabic, he wrote that Damascus was safer than Oxford and that he could even use the public baths with impunity without concealing his identity. Kinglake took for granted that as an Englishman he was obliged to confirm his rank by dealing with local officials through bullying and threats (p. 133).

For the purposes of ethnographic (or more precisely protoethnographic) description, there are two nineteenth-century explorers and travelers who are considerably more significant, if less flamboyant, than Sir Richard Burton: John Lewis [f] Burckhardt (1784-1817) and Edward Lane (1801-1876).

Burckhardt was born of a well-to-do Swiss family and became attracted very early in his life to the “discovery” of the Middle East.[30] As a young man he traveled to England to study the Arabic language for two and one-half years at Cambridge. During this time, he prepared himself for what he conceived as the rigors of life in the East by walking barefoot through the English countryside, while living only on vegetables for long periods. In 1809 at the age of twenty-five he left > for the Middle East and never returned, for he died there of malaria eight years later.

J Burckhardt’s books reveal him to be an engaging, if compulsive, scholar who

J can be relied upon for accuracy. He lived upon a minute stipend sent him by an English group calling itself the Association for Promoting the Discovery of the Interior Parts of Africa.

Throughout his stay in the Middle East, Burckhardt dressed in Turkish fashion, as did the urban elite of the period throughout much of the Middle East. He adopted the name of

Shaykh Ibrahim more out of convenience than in an attempt to conceal his true identity. Burckhardt’s Arabic was so excellent—both his classical Arabic and several contemporary dialects—that while in Damascus he translated Robinson Crusoe. Although recognized as a Christian, he was even accepted as an authority on Islamic law. Among his works are a collection of Arabic proverbs, an account of his travels in Nubia, and his detailed but elegant Notes on the Bedouins and the Wahdbys, his most ambitious work. [31]

Notes on the Bedouins is evenly divided between an ethnographic description of Bedouin society in Arabia and a detailed history of the Wahhabi movement, a form of Islamic puritanism which originated in the mid-eighteenth century in Arabia and rapidly acquired a political base, reaching its greatest territorial extent during Burckhardt’s stay in the Middle East. _;

The ethnographic section of the Notes compares favorably in some respects to recent anthropological studies of pastoral nomads in the Middle East. He describes Bedouin society in a coherent, organized fashion: There are sections on the layout of tents, the segregation of the sexes, dress, etiquette, domestic life and economy, religious practices, tribal organization, marriage, feuds, and warfare. No explicit sociological themes are explored, although an implicit concern with the nature of Bedouin “independence” runs throughout the account. Burckhardt was fascinated by the independence of the Bedouin, their “uncorrupted manners,” and their code of honor. His efforts to describe precisely the nature of social life in the desert carry more conviction than Burton’s ambiguous but constant reiteration that the Islamic world was beyond the pale of civilization. Admittedly, his point of departure is naturalistic description. He classifies the parts of the tent and the “parts” of tribal organization in virtually the same way a botanist would classify plants. One reason he appears to consider the Bedouin as “uncorrupted” and in contrast to the “debauchery” of townsmen is that stylistically he portrays them as timeless and unchanging. Even towns and the Ka^cba are described primarily by their physical form; many of the “ancient customs” which he describes are also virtually made into part of the physical landscape. In general, Burckhardt makes it clear that the observer is the contemplator and that the Bedouin, for all their initial charm, live a monotonous and unreflective life. Still, his work is not as fully anchored in the “orientalist” assumptions of his period as are other accounts and represents a genuine attempt to portray Bedouin society.

After describing the rules of hospitality , blood revenge, and the autonomy of most Bedouin tribes from the authority of central governments, Burckhardt asks the more general question: How it is possible to have an ordered society such as that of the Bedouin, with a code of law and conventions of conduct but yet have no written codes of law and no formal “legislation”? The form of Burckhardt’s question sounds awkward today, but it was one that interested many European political philosophers of the period.[16] Burckhardt’s contribution to its discussion was to perceive the relevance of his direct experience with such a society. Segmentation theory in social anthropology (see Chapter 5), which enjoyed considerable popularity from the publication of Evans-Pritchard’s The Nuer (1940) until the mid-1950s, can in many ways be considered to be a more systematic response to this same

question, since societies described as segmentary were said to exist without any formal leaders or governmental apparatus, all conflict within them being regulated by organized violence (feuds) among the groups involved.[17] On the basis of Burckhardt’s observations, later social anthropologists have been able to

[16] Burckhardt, Notes, pp. 378-82.

17

Burckhardt described in detail the institution of the feud as the Bedouin themselves conceived it. A segmentary diagram even appeared in his account (Vol. 1, pp. 150-51). construct more theoretically oriented arguments on the nature of political organization in pre-oil Arabia.[32]

The second section of the Notes concerns the Wahhabi movement. The ideological goal of this movement was the reform of Islam as it was then practiced. It was especially antagonistic to the popular custom of venerating the shrines of Muslim saints. In their drive to reassert the Quranic doctrine of the equality of all men before God, the Wahhabi movement succeeded even in destroying the tomb of the Prophet Muhammad. Because the movement politically united the tribes of Arabia, it was considered a threat to the Ottoman Empire and particularly to the Mamluk regime of Egypt. After repeated attempts to crush the movement, it was finally defeated in 1818 by an army of Muhammad ^cA1I, the ruler of Egypt. This occurred shortly after Burckhardt wrote his account. Burckhardt gathered reports of the Wafihabl-s and their doctrines from their representatives and other eyewitnesses. He carefully assesses the implications of the Wahhabi insistence upon settling nomadic groups in order better to control them, their leadership, the exact nature of their doctrines plus the reaction to them by Muslims outside the Arabian peninsula. Like latter-day anthropological descriptions of religious movements, Burckhardt’s account of the Wahhabl-s alternates between social history and providing the background material on religious ideologies and social forms necessary to follow his description of specific events.

Edward Lane’s Manners and Customs of the Modem Egyptians (1836)[33] provides a detailed account of urban Muslim society and thus complements Burckhardt’s Notes. Lane originally intended to enter the ministry and in this context acquired an enthusiasm for Oriental studies. Later he became an engraver but abandoned the work when it proved too taxing on his health. In 1825, at the age of twenty-four, he set out for Cairo and lived there more or less constantly until 1849. He adopted native clothes—the Turkish dress of Cairo’s elite—but never concealed his identity as an Englishman and a Christian. He delicately reminded his Muslim friends that Christ was also seen as a prophet in the Quran. Lane mixed freely with Egyptians and was held in confidence by many of them. Fluency in Arabic, such as he possessed, may not be absolutely necessary for certain types

of ethnographic inquiry (such as cultural ecology or certain forms of economic anthropology), but for any account of a society's beliefs, rituals, and social conventions it becomes essential. Anything less than fluency, or at least the anthropologist's ability to convince informants that he is fluent, generally handicaps the gathering of such data.

Lane does not appear to have considered his Manners and Customs as his principal work, although it is so considered today. He intended it as a popular book to complement an account of the manners and customs of the ancient Egyptians (those of Pharaonic times) that was then in circulation. His other studies included a translation of A Thousand and One Nights in a manner more accurate, if less sensational, than that provided by Burton and a massive Arabic-English lexicon which he never lived to complete.

Lane, modestly wrote that his intention in Manners and Customs was simply to make some of his countrymen "better acquainted with the domiciliated classes of one of the most interesting nations of the world, by drawing a detailed picture of the inhabitants of the largest Arab city." He regarded his book as an accessory to the reading of translations of Arabic literature which was then in vogue.[20]

His descriptions of urban life are elegant in their economy and clarity. They include dress, child rearing, ceremonies associated with birth, marriage, and death, domestic life, the marketplace, government, Islam, and above all the nuances of etiquette and the taken-for-granted conventions of society. As with the writings of Burckhardt, there is no explicit theoretical orientation to Lane's writing, and there is a tendency to view Cairene society as an object to be contemplated and classified. Theoretical concerns become important only in subsequent scholarship such as the work of Robertson Smith.

*** William Robertson Smith (1846-1894)

FIGURE 2-3 Bridal procession in Cairo, 1835. (From Lane, Manners and Customs, p. 164.)

The brilliant, tenaciously cosmopolitan William Robertson Smith is the first of the scholars considered in this chapter to have a specific, conscious theoretical orientation toward the study of Arab society. As Thomas O. Beidelman has written in a recent appraisal of Smith's work, whatever Smith's shortcomings by today's theoretical perspectives, he "sought to define the essential nature of religious behavior and approached the analysis of social institutions through comparative and historical studies."[34] This explicit goal, and Smith's

means of achieving it, remains one of the central concerns of contemporary social anthropology.

Smith’s interests are difficult to'summarize. He began his scholarly career by acquiring a dazzling reputation as a mathematician but quickly turned to Biblical studies. In 1875 at the age of twenty-nine he was given the extraordinary distinction for a person of his youth of being named to a committee to produce an authorized English translation of the Bible. He also assumed editorship of the Encyclopaedia Britannica, where his wide-ranging interests and responsibilities “led him to a personal acquaintance with nearly every important intellectual in Britain and a large number on the Continent... men as different as Swinburne and Darwin, Huxley and Kelvin, Spencer and Burne-Jones.”[35] So compulsively thorough was he in his editorship that he is said to have personally read every one of the articles submitted.

One of Smith’s strongest personal interests was in the “historical” criticism of the Bible. This approach to Biblical study, already prevalent on the Continent, asserted that the texts of the Bible should be treated as any other historical document and analyzed accordingly for authorship and historical authenticity. Like other scholars of his time, Smith found this approach easier to apply to the Quran than to the Bible because of strong opposition from conservative Christians. By all accounts, however, Smith was strong-willed, independent-minded, and had more than a touch of arrogance. His determination to express his views in an uncompromising manner eventually led to dismissal from his professorship at Aberdeen by the General Assembly of the Free Church of Scotland.

Like most Biblical scholars, Smith was fluent in Arabic and other Semitic languages, as well as the principal European languages. To improve his Arabic— he is said to have spoken it better than Burton—he made several voyages to Egypt and North Africa between 1878 and 1890. In 1878-1879 he spent about a year in Cairo, divided between two visits. On one of these visits he managed to make camelback tours of the Arabian peninsula, Palestine, and Syria.[36]

As Beidelman writes, Smith seems to have deeply enjoyed these visits. Like Burton, he traveled in native garb and adopted an oriental name, in this case the Arab one of ^cAbdallah Effendi. On one brief excursion from Cairo, in fact, he was accompanied by Burton. Smith, with his swarthy looks and dark beard, often managed to pass as an Arab.

FIGURE 2-4 W. Robertson Smith as ^cAbdatlah Effendi. (From J. S. Black and G. Chrystal, The Life of William Robertson Smith [London: A. 8t C. Black, Publishers, 19021.

Courtesy Adam & Charles Black, Publishers.)

Like most Victorians, Smith was profoundly pleased with his Britishness and sometimes shared the excesses and prejudices of his time in thinking about alien peoples. For instance, he wrote:

It would be a mistake to suppose that genuine religious feeling is at the bottom of everything that justifies itself by taking a religious shape. The prejudices of the Arab have their roots in a conservatism which lies deeper than his belief in Islam. It is, indeed, a great fault of the religion of the Prophet that it lends itself so readily to the prejudices of the race among whom it was first promulgated, and that it has taken under its protection so many barbarous and obsolete ideas, which even Mohammed must have seen to have no religious worth, but which he carried over into his system in order to facilitate the propagation of his reformed doctrines.[37]

Despite these lapses into the conventional stereotyped wisdom of his age, Smith considered the systematic study of contemporary Arab society—at least what he habitually referred to as that of the “pure” Bedouin—as crucial in his attempt to comprehend how men’s experiences in society relate to their religious and ethical conceptions.

Smith’s two principal books, Lectures on the Religion of the Semites (1889) and Kinship and Marriage in Early Arabia (1885) are both readily obtainable in paperback reprint editions, so I concentrate here on the principal assumptions contained in them about the study of human society.[38]

First, like many of his contemporaries, Robertson Smith accepted the concept of the evolutionary progress of human society. As T. 0. Beidelman stresses, this “evolutionary” perspective was encouraged by the basic Judeo-Christian belief in the ethical and intellectual development of a chosen people that, for Christians, culminated in the message of Christ. Thus societies could be arranged on a sort of ladder, with Victorian England predictably on the highest rung. Smith’s studies of Arab—which for him meant Bedouin—kinship were considered in this context to be a key to understanding ancient Semitic society.

Second, Smith saw a close relationship between the stage of development of a social group and the nature of its intellectual, religious, and moral life. He assumed that our perception of nature and the universe is modeled on our experience in society. This idea is adequately developed in his Lectures but is even more sharply delineated in a separate study of prophecy in ancient Palestine.[39] Smith argued that each prophet could speak only for his own time and thus had to convey his message in terms that could be understood by members of his own society. The ideas of prophets could be ahead of those prevalent in their own society but not too far. Thus, Smith conceived of the problems of the alienation of people from society and the means by which their ideas could affect social transformations. For example, for a scholar to grasp, the message of Ezekiel, the social organization of that prophet's time had to be delineated, together with the cosmology and modes of thought and expression contemporary with it. If Ezekiel's prophetic message was then found to differ from that of Samuel, Smith argued, it is not because of any contradiction in the Bible but because Samuel addressed himself to different groups and situations.

Given Smith's assumption of stages of social development, and their specific relationship to ideologies, his scholarly interest in the Bedouin becomes more apparent. Smith saw Bedouin society as a holdover relatively unchanged from the time of the Old Testament. Through studying the present-day Bedouin and what was known of Bedouin society just prior to and immediately after the time of the Prophet Muhammad, Smith sought through analogy and comparison to "reconstruct" the state of society as it was in the time of the Patriarchs. Such an ahistorical assumption is no longer acceptable in contemporary social anthropology, but it is important to recognize that it led Smith to evaluate carefully the ideas about kinship and political organization of Arabs both at the time of Muhammad, on which, extensive information was available through traditional Islamic scholarship,' and in the nineteenth century.

Finally, Smith used ethnographic and historical data to support explicitly formulated theoretical assumptions about the nature of Arab social organization and its evolution. Part of his argument concerning the evolution of Arab society is simply wrong. In the second part of Kinship and Marriage, for example, he presumes the existence of an earlier, matrilineal system of descent reckoning among the Arabs on the basis of what is today regarded as insufficient evidence. Yet the first section of the book is one of the enduring classics of social anthropology, for it presents the first systematic account of the social structure of the feud and the basic principles of kinship and political organization among the Arab Bedouin. Smith essentially sets forth the fundamental features of what later were to become known as segmentary societies. His argument was a direct inspiration for Evans-Pritchard's later (1940) study of segmentation among the Nuer of the southern Sudan.[40] Similarly, Smith's conviction that symbolic behavior was related to the nature of social groups was the basis upon which Emile Durkheim derived inspiration for his own sociology of knowledge and of symbolic forms.[41]

Smith was also the first to recognize that the genealogies used by the Bedouin to describe their sociopolitical order were not descriptions of concrete, actual relations among themselves but ideological charters for the construction of social groups. Smith realized that

ecological necessity and changing political conditions could result in shifts in the composition of groups. To gain political strength, for instance, ambitious chiefs would be anxious to include as wide a net as possible of assumed kinsmen and clients in their following, and Smith was well aware of the means by which weaker groups and individuals could manipulate genealogies so as to establish claims to kinship with more powerful groups.[42]

In Chapter 5, Smith's influence upon the ideas of more recent anthropological concern with segmentation and related concepts, especially in the work of E. E. Evans-Pritchard, Emrys Peters, and Ernest Gellner will be discussed more fully. The critical point to recognize for the present is that studies such as those of Robertson Smith reached a wide audience and provided considerable impetus to the understanding of the Middle East, the Arab world, and Islam. Even when Smith constructed theoretical arguments that are considered faulty in retrospect, he touched upon many of the basic issues of social anthropological inquiry, including the social base of symbolic behavior, the nature of the feud, and the ideological basis of conceptions of kinship. As with Durkheim, many of his insights remain fresh today. In particular, his theoretical arguments and documentation of them through ethnographic and historical sources were much more boldly conceived than many of the "functionalist" studies that were later to predominate in the study of the Middle East.

*** Scholarly Inquiry and Imperial Interests

Like the other human sciences, anthropology has become a critically reflexive discipline. By this I mean that its leading practitioners regard an awareness of their implicit theoretical assumptions and how these assumptions are indirectly, yet pervasively, influenced by the intellectual and political setting in which scholarly inquiry is carried out as an integral part of any research. A similar consciousness of implicit scholarly assumptions can be seen to pervade Islamic studies, although without the single-minded focus upon political considerations that pervades much of the anthropological work of this genre.[43] Nineteenth-century scholars were aware of many of the assumptions that pervaded their work, but even when directly concerned with the nature of non-Western political institutions, they remained remarkably silent on the exact consequences of imperial conquest and of European colonial rule.[44] Scholarly investigations by Europeans of "oriental" societies were carried out in the context of impending imperial domination or, in some cases, of actual colonial rule, and this fact;must be taken into account, since the direction of scholarly inquiry often merged with the interests of the colonial power. It would be wrong, however, to interpret such a fusion of interests anachronistically by contemporary standards and to regard all such research as politically sinister, as proponents of more simplistic versions of neo-Marxism often argue. Some anthropologists argue that ethnographic inquiry in this century and the last was carried out in the context of European bourgeois society expanding its political, economic, and intellectual domination. This is certainly the case, but the specific consequences of such domination for patterns of inquiry still must be demonstrated. In any case, such an assumption in itself hardly invalidates anthropological inquiry. Many ethnographers who participated in colonial rule were quite aware of the context in which their work was carried out. A salient example is the French sociologist

Jacques Berque, whose father was for many years Director of Native Affairs for the French government in Algeria. Berque himself was raised in Algeria and had a distinguished career in the Moroccan colonial service. Even in the 1930s Berque's writings indicate a subtle awareness of the nature of the colonial situation which he experienced—a theme which in recently years has become much more developed in his work. Of course. Berque, like other scholars, was profoundly affected by the milieu in which his research was conducted, but this fact hardly denies the possibility of competent sociological inquiry.

More plausible than direct correlations between political context and scholarship is the sort of argument put forward by the literary critic Edward Said, among others, that imperial domination and studies of the Islamic "Orient" bear a subtle and abstract relation to each other. They shared in common a general drive to impose "order" upon the non-European world. In one case this order was political and military; in the other it was the attempt to classify, arrange, and codify knowledge of an alien civilization.[45] The two sorts of order and control were often closely related, but they could also operate independently of each other, as has been shown by the radical transformations in the disciplines concerned with Middle Eastern and Islamic studies over the past century and a half.

The nature of traditional Muslim polities and the consequences of colonial rule are important issues and will be dealt with in detail in later chapters. In the present context it is sufficient to demonstrate that the situation of impending or actual colonial rule did much to encourage sociological investigations into the nature of Muslim and Middle Eastern society.

Here I present examples of two styles of research stimulated by imperial interests. The first is the independent scholar who later contributed his skills to solving the problems of colonial administration. This is the Dutch Orientalist Christian Snouck Hurgronje (1857-1936). The other style is exemplified by team research directly tied to colonial control from its inception. This is the French Mission Scientifique au Maroc (Scientific Mission to Morocco).

Snouck Hurgronje's lifelong interest was in the study of Islam and he is best known for his intensive studies of Islam and politics in Indonesia, when it was under Dutch colonial rule.[46] Earlier in his career, however, he spent a considerable period of time in the Middle East. As a young student in Holland, he was interested in theology and Old Testament studies but soon shifted his focus to the study of Islam. His thesis topic in 1880 was the origin of the Islamic pilgrimage. In 1881 he obtained an academic post in Leiden at the Institute for Training Administrators for the Dutch Indies, a post he held until 1887. At the same time he devoted himself to the study of the Arabic language. He resolved to travel to Mecca, and in August of 1884 he arrived at Jidda, the principal port of Muslim pilgrims, where he appears to have been courteously received by its religious scholars ([Q] ulama').

Although Snouck Hurgronje dressed as a Muslim during his travels in Arabia and adopted a Muslim name, ^cAbd al-Ghaffar, it appears that he did not conceal his identity

as a European to the Muslim scholars and officials with whom he was in contact. He received permission from the Ottoman administration and local Arab notables to continue to Mecca, where he arrived in February of 1885. Unlike most European travelers such as Burton, who visited Mecca only for the brief period of the annual pilgrimage and in disguise, Snouck Hurgronje managed to stay for six months. He had to leave before the pilgrimage itself, which took place on the 17th of September in 1885, because of the indiscretions of a French vice-consul in Damascus that threatened to create a minor scandal for the local officials through whom Snouck Hurgronje had made his arrangements. Nonetheless, it is significant that Snouck Hurgronje was later extended an official invitation to return, although he never did.

In Mecca, both the Turkish officials and the descendants of the Prophet (Ar. pl. shurafa’) who were the hereditary rulers there were aware of Snouck’s identity. As a sign of the support he obtained from the elite, he managed to take a number of photographs, among which are the first ever obtained of the Ka^cba, as well as

FIGURE 2-5 The Ka^cba, 1884. (From C. Snouck Hurgronje, Bilder-Atlas zu Mekka [The Hague: Martinus Nijhoff, 18881.1

FIGURE 2-6 A Meccan bride, 1884. (From Snouck

Hurgronje, Bifder-Atlas.)

others of pilgrims, local notables, and even unveiled brides and the women of several of the most distinguished households of the city.[47]

As a result of his stay, Snouck Hurgronje was able to write a detailed account of everyday life in Mecca, with chapters on everything from children’s games and rituals surrounding life crises to kinship, trade, religious brotherhoods, political organization, scholarly activities and intellectual life, proverbs, and domestic arrangements.[48] His account of the intellectual activities associated with the princi-

pal mosques of Mecca is pne of the few treatments of traditional Muslim scholarship which appreciates it for the vigor that such scholarship has managed to maintain until comparatively recent times.

Snouck Hurgronje placed considerable importance upon his ethnographic studies of Mecca. This was in direct contrast to the emerging disciplines of the history of religions and oriental studies, which tended to place greater weight on the evaluation of textual evidence as the basis for comprehending religious traditions. For Snouck Hurgronje, to understand the social reality of any religion, whether in the historical past or in the present, one had to have a thorough understanding of the social context in which that religion was experienced by its believers. This underlying assumption is of course shared by contemporary social anthropologists.

As indicated earlier in this chapter, ethnographic inquiry in the nineteenth and early twentieth centuries was often regarded in colonial contexts as an adjunct to political and military control, especially during periods of “native” unrest. This trend is especially prevalent in the ethnography of North Africa. In Algeria, as I have indicated, the social institutions and beliefs of native Algerians were generally ignored during periods of unquestioned French domination, only to become the subject of .intensive analysis during periods of resistance to French rule. The movement against the French led by Amir ^cAbd al-Qadir in the 1830s and 1840s was one such occasion; the stiff resistance met by the French in Berber-speaking Kabylia, the last region of Algeria to succumb to French domination in the 1850s, was another. During and shortly after conquest of the region, studies of Kabylia were abundant and created stereotypes about Berbers that were to persist for generations afterward.[36] In the Algerian case similar ethnographic interest was not to be rekindled until the 1950s, in the final, violent years of colonial rule.

It was in Morocco that organized ethnographic inquiry reached its fullest development. The incorporation of Morocco as a protectorate within the pax gallica dates only from 1912, but from the late nineteenth century French colonial interests began seriously to contemplate extending their “civilizing mission” to Morocco. The quality of the administrators and scholars first attracted to Morocco is in many ways comparable to the quality of scholars and officials attracted to India within the British Empire. What is certain is that in regions of English influence in the Middle East there is no body of ethnographic study comparable to that which exists for Morocco. French Moroccanists were frequently of high intellectual caliber and heavily influenced by the main sociological currents of their day. Admittedly they were not unaffected by the romantic vision of France as the first imperial power since the Romans to be capable of uniting most of North Africa under one rule. By the late nineteenth and early twentieth centuries, several individual scholars, usually backed by colonial interests or the French government, had begun systematically to describe Morocco. [49]

The collective investigation of the nature of Moroccan society began in 1904 with the founding in Tangier of the Mission Scientifique au Maroc. This brought together a group of talented scholars and scholarly diplomats who spoke Arabic and frequently Berber and who were well grounded in current sociology. This group produced extensive monographs on Moroccan history, the workings of the traditional Moroccan legal system and administrative apparatus, the organization of traditional crafts and commerce, Muslim education, religious beliefs and rituals, linguistic texts through which local dialects could be rapidly learned by administrators, tribal divisions, and translations of key legal, religious, and historical

[36] So thorough was the ethnography of the region that Emile Durkheim referred to it frequently in his classic The Division of Labor in Society (New York: Free Press, 1966 [orig. 1893]).

documents.[50] The plan of studies undertaken was conceived in a primarily utilitarian vein. This is clear from the fact that shortly after the beginning of the protectorate, the Mission Scientifique formally was attached to the protectorate administration. Later, in the 1920s, it became a part of the Institut des Hautes Etudes Marocaines (Institute for Higher Moroccan Studies), an organization whose principal task was to train colonial administrators.

One of the most distinguished members of the original team of scholars was Edouard Michaux-Bellaire, who became director of the Mission Scientifique in 1907. After the Mission had been in existence for nearly two decades, Michaux-Bellaire described its initial purpose as the sociological “reconstitution” of Morocco’s social life not only through the study of books and manuscripts but through the collection of tribal traditions and the study of religious brotherhoods, economic life, and families.

It was a question of creating ... so to speak, the catalogue of Morocco, its tribes, its towns, its religious orders, to rediscover through them origins, ramifications, struggles, and alliances, and to follow them in history through different dynasties, to study institutions and customs, in a word, to reconnoiter, so far as possible, the land in which we might be called to act one day, so as to permit us to act in full awareness of the consequences of our actions.[51]

To sum up, this chapter has indicated the convergence of interests which led to the ethnographic discovery of the Middle East in the nineteenth and early twentieth centuries. If at the beginning of this period the Islamic “Orient” served as a projective screen upon which European fantasies about the exotic and unknown could be projected, this was to be replaced by more systematic observations under the impetus of growing colonial and imperial interests and the centrality which the ethnographic study of the region had to key intellectual topics of the period. In later chapters that deal with contemporary

anthropological research, some of the themes introduced here will be taken up again in more detail.

** 3. The Functionalist Era: Village and Community Studies

*** Functionalism as Theory and Practice

This chapter continues the discussion of the intellectual technology by means of which knowledge of Middle Eastern societies has been organized. As a movement dominating social anthropology, functionalism can be traced from its origins in the second decade of the twentieth century through its apogee in the 1930s and eventual decline, but not disappearance, as a theoretical doctrine in the late 1950s. Although it was a dominant trend in English and American anthropology, it never acquired the same, firm hold upon German ethnology or the work of French anthropologists and sociologists interested in the non-European world. There also were pockets of anthropologists in the English-speaking world who ignored the functionalist movement, although for the most part such individuals were of an older generation that followed earlier paradigms for scholarly investigation.[1]

The French sociological tradition remained largely uninfluenced by the functionalist movement, although the English and American functionalists often considered Emile Durkheim as providing a theoretical base for their own position. Durkheim’s collaborators and successors made extensive use of ethnographic materials and courageously tackled such broad issues as the character of entire civilizations. Marcel Granet’s study of China (1922)[52] is the best known of these, although no equivalent study was made for the Islamic world despite Durkheim’s own use of Algerian ethnographic data and his interest in complex societies. Likewise, French human geographers took advantage of France’s Middle Eastern colonial domain to undertake a number of detailed studies of traditional ecological adaptations, primarily of pastoralists, throughout the region.[53] With the exception of studies of this nature, functionalism pervasively influenced the character of anthropological research in the Middle East as elsewhere in the world.

[J] One urominent example is the Finnish anthropologist Edward Westermarck (1862- 1939) who taught at the University of London for most of his career (1904-1930). Beginning at the’ turn of the century, he lived intermittently in Tangier over a period of roughly two decades and produced a number of monographs concerning various aspects of Moroccan rural society. Among his principal publications were Ritual and Belief in Morocco (New Hyde . University Books, 1968 [orig. 1926]); Wit and Wisdom of Morocco .(New York. Horace Liveright, Inc., 1931), ani Marriage Ceremonies in Morocco (London: Macmillan, 1914).

A by-product of functionalism, however, was the turning of anthropological interest away from the Middle East. The few studies which continued to be undertaken were primarily those which treated villages and tribes as closed social worlds, even when large numbers of villagers regularly sought work in the cities of their countries or overseas and depended upon income from such temporary or permanent migration for their sustenance.

Because functionalism so clearly illustrates how theoretical preconceptions shape what an anthropologist or sociologist “sees” in fieldwork, and is far from being a moribund framework for research, it is particularly interesting to examine its dominant conceptions in detail. As a theory, functionalism emphasizes the explanation of social phenomena on the basis of their interrelation with coexisting events or social forms, rather than in terms of how any of these came to be.

Such an extreme theoretical doctrine requires that societies be treated as closed entities. Hence it appeared to account much better for relatively simple, small-scale societies than for the larger-scale, historically known societies which anthropologists typically encountered in the Middle East. Only by the device of treating Middle Eastern villages and tribes as if they were small-scale, relatively isolated societies was it possible to make sense of them in terms of functionalist theory.

The best way of considering functionalism is as a variety of related theoretical perspectives instead of a unified theoretical viewpoint. Yet these perspectives share essential features. One of these is the idea that societies can be considered self- contained organisms, even if they are sometimes so complicated that it is hard to determine just what are their component parts—persons, social roles, or institutions—and the precise “functions” of these parts.

The convenient analogy of the human body to society was occasionally employed by functionalists to illustrate their ideas. In the case of the human body, the component parts are dissimilar, but by each performing its complementary task, the organism as a whole is able to survive: The heart pumps blood, the stomach digests food, and the legs transport the body from one place to another. Functionalists argued that societies had similar parts.

The anthropologist A. R. Radcliffe-Brown was an early popularizer of functionalist theory. His own analogy for the study of society was the horse. The articulation of the various parts of a horse, he argued, cannot be explained by study of the origins of the horse and its evolution, but only by the functions performed by each part in the present. In an accurate and biting critique of this approach, E. E. Evans-Pritchard commented that Radcliffe-Brown might be correct in writing of horses, but societies cannot be compared to them.[54] The notion of society is only an observer’s abstraction, so that the “parts” do not always fit together. In essence, the anthropological study of social and cultural form necessarily involves the study

of these forms in their historical context. Sociological forms are necessarily abstracted from events and situations that to a certain extent are always unique.

In an important sense, all anthropologists are functionalists in that they seek to interrelate various aspects of social action and systems of meaning, or culture. What distinguishes functionalism as an explicit theoretical framework is its emphasis upon describing societies as if they were in equilibrium. Only the more extreme of the functionalists completely ignored the data of historical change, but many chose to work in preliterate societies in which accounts of past events independent of immediate social context were unavailable or difficult to obtain. Most functionalists took historical facts into consideration when they could obtain them, but such data fitted only awkwardly into the main theoretical framework. Since functionalist theory has the built-in bias of treating societies as if they were closed systems existing at one historical moment, there was a tendency not to consider the factors that led to the “transition” of a society from one state to another. Historical transformations were instead thought of in layer-cake images, with each slice of time merely superimposed. The limitation of this strategy is that it serves more to contrast the end points of certain processes rather than to focus on the nature of the changes taking place. This is because the “synchronic slices” approach encourages a conception of historical change in terms of discrete, episodic units, rather than as a continuous process. Emphasis was placed upon the description of societies in periods when it was presumed there was little significant change rather than at periods of conflict, revolution, or major transition.[55] An alternate version of the same basic argument regarded social forms as cyclical, in which a tendency to social inequality, for instance, would begin to develop and then be replaced by a movement toward egalitarianism.[56]

Even in the small-scale, relatively isolated societies where the notions of functionalism appeared to work best, there were clear indications of the artificial conventions that functional theory imposed. Such small-scale societies were generally studied in a colonial context but described as they supposedly had existed in the precolonial past, with only passing references being made to the consequences of European conquest and administration. The effects of European incursion upon the central institutions of political authority, kinship, religion, and economics were generally ignored. It was also usually assumed that such societies had been essentially unchanging in form in the period prior to colonial conquest or to sustained contact with the West. In the heyday of functionalism, American anthropologists frequently used the term base-line to describe such societies prior to “outside” contact. This term clearly reveals the careless sort of assumption often made about the historical past.

*** Functionalism in the Study of the Middle East

The limitations of the concept of functionalism became particularly clear when the j notion was applied to complex, historically known societies. By the 1950s, minor qualifications were being added to the basic arguments of functionalism so that the “functional” description of a

society was frequently complemented by historical description. Evans-Pritchard’s The Sanusi of Cyrenaicaf is a classic monograph by an anthropologist which embodies the resulting contradiction. Evans-Pritchard’s criticisms of extreme forms of functional theory have already been mentioned. My commentary here is based upon the implicit argument of The Sanusi.

The goal of the monograph is to describe how an Islamic religious order, the Sariusiya, became in the nineteenth century the predominant religious order to which the transhumant Bedouin tribes of Cyrenaica (Libya) were affiliated. He argues that the Sanusiya was the only order to adapt effectively to the acephalous segmentary social organization of the tribes, in which each individual was presumably an equal of every other and no one occupied a position of full-time leadership, so that in the twentieth century, Italian conquest and colonization provided the sustained pressure which was necessary to transform the acephalous segmentary . tribal society into a state organization under the leadership of the head of the Sanusi religious order, who subsequently became Libya’s first monarch. But a closer examination of this study indicates that the section in which the social structure of Bedouin tribes is described is abstract and totally separated from the much longer straightforward historical account describing the growth of the Sanusi religious brotherhood and the Italian conquest of Libya. Only in two crucial paragraphs (pp. 104-5) does Evans-Pritchard discuss how Bedouin tribal society was presumably transformed from an acephalous segmentary society into a state organization. He speculates that prolonged external pressure forces “segmentary” societies into such transformations but of course provides no detailed description of this process. His historical account is fully intelligible without reference to the abstract description of the segmentary structure of Bedouin society as it presumably was in the precolonial historical past (pp. 29-61). As social history the book is eminently successful, but the ahistorical description of Bedouin social organization is marginal to that success.

Perhaps the most broad-gauged attempt to apply functionalist theory to the Middle East was provided by the physical anthropologist Carleton Coon in Caravan: The Story of the Middle East, first published in 1951 and revised several times over the following decade. This book was the first general anthropological introduction to the area and for a time enjoyed a sustained popularity. Yet Caravan also glaringly portrays the drawbacks of functionalism. The book’s unity is sustained by the metaphor of the mosaic, a device which is useful for conveying some of the bare geographical and ethnographic facts concerning the Middle East and North Africa— modes of livelihood, physical characteristics of the population, religious and linguistic groupings, and political organization. Unfortunately, it is less adequate in explaining the interrelations among these elements or their known historical transformations. In fact, a principal negative virtue of Caravan is its clear exemplification of the weakness of functionalist theories in providing meaningful accounts of historically known societies. Thus in his first chapter, “The Picture and Its Pieces,” Coon writes that the mosaic pattern of the region becomes clear if the “little pieces of plastic and broken glass” are removed. By plastic and broken glass he means essentially everything that is “modem” or in transition in the Middle East. Coon writes that “a culture in transition is hard to describe and harder to understand; we must find some period in history when the culture was, relatively speaking, at rest.”[58]

This assertion means that Coon's method is, for instance,to describe Egyptian society as it presumably was prior to Bonaparte's invasion, Morocco as it existed in the late nineteenth and early twentieth centuries, and Turkey as it was in the nineteenth century and then to assume that these descriptions essentially hold in all key

respects for much longer periods of time. These are "base times" for Coon, and he assumes that for hundreds of years-from at least the fifteenth to the nineteenth century in most parts of the Middle East—societies were "frozen" in form. Recent historical research has underlined what was already known before the publication of Coon's book: Ahistorical assumptions concerning Middle Eastern societies are profoundly inappropriate. The extraordinary assumption of centuries of cultural "rest" creates a highly artificial and misleading way of looking at any society or civilization and is empirically inapplicable to the civilizational area which he describes. Throughout the period of cultural "rest" that Coon assumes, highly significant transformations were occurring throughout the Middle East. To name only one, in the nineteenth century the Middle East was increasingly being drawn into the world capitalist economy. This was one of the principal factors leading to the instability of central governments in many regions such as Morocco after the 1860s. The resulting instability provided a convenient excuse for European colonial intervention in some instances and the control of vital governmental services such as customs revenues in others. Nor were all transformations of the society related to external factors alone. Much of the impetus for change came from developments "internal" to Middle Eastern societies themselves.

Elsewhere, Coon describes Islam as the "right" religion for the Middle East because it survived as the dominant religion in the area for such an extended period of time. Hence he argues that Islam must be in "equilibrium" with the environment. Here again the "horse" analogy is lurking in the background. A similar argument underlies his explanation of the prohibition upon wine in the Islamic world. Coon suggests that with so much of the area a desert and the Arabs so hospitable, it would be too cumbersome and expensive to carry goatskins of wine through the region.[9] Or consider his more general statement: "The keynote to the Islamic way of life is that it provided a maximum goodness of fit for a swarm of human beings, living in the environment of the Middle East, to a progressively deteriorating landscape."[10] Again, this statement constitutes a massive tautology. It could just as well be adapted to Christianity in Europe or, in the New World, to Aztec human sacrifices. All that needs to be argued is that such practices exist because they fulfill a function.

To return to the specific consideration of the Middle East, Coon's assertion of a "fit" between Islam and the Middle East ignores the fact that the center of gravity of the Muslim population in the world falls somewhere between Pakistan and Iran; in fact, the majority of the world's Muslims live on the Indian subcontinent and in Southeast Asia. Admittedly, Coon's argument also can be adapted to the environmental circumstances of these regions,

although again the argument asserts no more than the fact that if things were not the way they are, then they would be different.

The serious theoretical shortcomings of Coon’s book did not prevent it from being a practical and popular introduction to the area, especially at a time when there was no other general text available. Yet there are alternatives to functionalism in the social sciences. General propositions about social organization and culture can be made without turning them into universal “laws.” Such universal laws simply do not exist except in a most trivial or acultural sense in human societies.

[9] Ibid., p. 347.

[10] Ibid., p. 346.

Coon was exceptional in writing of a civilizational area, for as I have previously indicated, the professional work of anthropologists is primarily upon a much more minute scale. At this reduced scale, whatever the shortcomings of functionalism as sociological theory, it has the decisive practical advantage of providing an organizing guide for anthropological fieldwork. It encourages anthropologists to conceive of societies in their totality—or, to be more modest about the scope of anthropology as actually practiced, it encourages fieldworkers to collect information on kinship, myths, politics, economics, and other aspects of social life and to seek out interrelations between these various activities even when the linkages are not immediately apparent. As a consequence, a substantial number of ethnographies now exist that provide resource materials for purposes other than those for which they were originally intended. It can be argued that the notion of gathering documentation on the “total” social world of individuals, whether they be office workers in an industrial society or villagers who spend a large part of their lives in relation with significant others from the same immediate locale, constitutes a distinctively anthropological technique of viewing culture and society. As a theory, functionalism has limitations which are obvious once they are made explicit, but its organizing concepts have proved to be an enduring ad hoc stratagem for effective field research.

Three examples are presented here to indicate the strategies involved in the functionalist study of societies. I have deliberately chosen examples of research toward the end of the functionalist era, the 1950s and early 1960s, and of researchers who have since acknowledged the limitations of their earlier theoretical assumptions. The first two examples concern societies in which irrigation is a main economic feature; the third example involves an agricultural village in southern Lebanon.

There were several converging reasons for the interest in irrigation societies in the 1950s. One was the impact of Karl Wittfogel’s Oriental Despotism,[59] which argued

that irrigation systems, or at least certain forms of them, necessitated the development of hierarchical forms of sociopolitical organization. The thesis attracted the attention of a wide range of archaeologists and social anthropologists, for it provided what was considered to be a testable framework in which the relation between modes of production and social organization could be explored. Another reason was that studies of irrigation societies fit in nicely with the conventions of functional explanation. After all, in a region such as the Middle East, irrigation systems and the scarce resource of water which they distribute are vital to agricultural production and social life. Social institutions are sharply constrained by ecological considerations. It would be a poor use of metaphor, but nonetheless accurate, to point out that functionalist theory itself is a hydraulic theory of the integration of society; A shift in any component invariably brings about shifts in the others.

The first example concerns the Fadiji Nubians of Upper (southern) Egypt as they were studied in 1961 by the late Abdul Hamid el-Zein, then an ardent functionalist and later a leading proponent of the structural study of ritual and symbolism.[60]

The people Zein studied were relocated elsewhere in Egypt in 1963 when the construction of the new Aswan dam resulted in the flooding of their old village sites, so that Zein’s description is necessarily in the past tense. Prior to the flooding, settlements and fertile land were located in a narrow belt along the Nile, with the settlements framed on both sides of the river by rocky, barren mountains. The region received only one inch of rainfall annually, so that agriculture was entirely dependent upon irrigation. Prior to relocation in 1963, there were earlier pressures upon the availability of land induced by technological change. The first Aswan dam built in 1902 raised the water level in the winter of each year and thus reduced the land locally available for cultivation; the same effect followed later heightenings of the dam in 1912 and 1933. In the low water season of August and September, this low-level land was briefly available for cultivation in addition to the land located at higher elevations. Wheat and beans were the principal crops, although many villagers also owned palm trees and harvested their dates.

In three hundred pages Zein works out the implications of the water wheel for the social life of the Fadija. In the course of his argument, it becomes clear that the Fadija never were self-subsistent agriculturally. In the nineteenth century their village was important as a way station in the slave trade between Cairo and the Sudan, while more recently it was important in the lucrative smuggling between Egypt and the Sudan. In addition, Nubians have for long emigrated to other parts of Egypt—a phenomenon that was already important in the nineteenth century. The remittances these emigrants sent home were necessary for the subsistence of their relatives and families. Significant in this respect, the principal crops of the Fadtjz were insufficient for their subsistence, so that many villagers played active roles in the market as merchants and traders as a necessary part of their livelihood.

But, as Zein specifies, the Fadtja nonetheless claimed that their status in the community was linked directly to the ownership of land and water rights.

Zein cites a Nubian proverb to reinforce his theme of the water wheel as a central element in Fadiji society: “The water wheel is like a mosque, and those who serve it are like those who serve the mosque.” Zein treats membership in the village, status in the local community, and central rituals as if they were all part of a closed system. Thus he emphasizes the land shortage and the ecological constraints that made it impossible for men to build up wealth in animals. He sees education, emigration, and market activities as partial solutions to the chronic land shortage, thus conceiving them as a sort of safety valve so that the system of the village was able to work.

In describing the ownership and operation of the water wheel, Zein emphasizes the functional justification of certain traditional arrangements. Thus the base of a water wheel is hard to site—few locations are suitable for it—and difficult to repair. It must be owned by one man, writes Zein, because it is so crucial. The upper parts of the water wheel, including the buckets, are individually owned or rented. In the case of a serious quarrel certain of these upper parts (unlike the base) may be removed and replaced by those belonging to someone else without seriously disrupting the wheel’s operation. Through case studies of disputes, Zein indicates how Fadifi social institutions prevent conflicts from interfering with their livelihood. Similarly he indicates how patterns of marriage alliances are linked to the ownership of water rights. Co-owners of water rights seek intermarriage between their households in order to solidify their alliances and lessen the problems connected with inheritance. The roles played in rituals are also closely associated with such rights. The water wheel thus is a concrete artifact whose study reveals the components and functioning of the supposedly closed social system of the village.

FIGURE 3-1 Water wheel, Egyptian Nubia. The wheel is partially covered by branches to retard evaporation. (Courtesy Abdul Hamid WI.el-Zein.)

Although Zein’s densely packed monograph does not provide a “total” explanation of village life, as functionalist arguments often promise, it manages to provide an intricate description of what he asserts to be a key institutional complex within Nubian life. The ethnographic description of the water wheel, its maintenance and its relation to other aspects of village life provided by Zein constitute what is undoubtedly the best descriptive account of the social organization of irrigation practices available for the Middle East. Less convincing is his overall conceptual framework, in which the components of society at a given moment are considered to be in a closed equilibrium with each other. In the classical functionalist tradition, Zein considers the water wheel and ownership of water rights to be in direct relation to the cultural value of community maintained by the Fadija (“moral”

community in Durkheim’s terms) and to the acquisition of social honor within the community. Yet Zein is such an exceptionally able ethnographer that his own data suggest that the system of status honor that he described was more complex and less holistic than he claimed. For instance, villagers who could command cash from remittances or from trading activities fail to fit into the nicely established equilibrium of status honor tied to land and water rights which Zein asserts. When returning emigrants invested their money in land, Zein was able to provide an account of their role in the status system. But when the funds were invested in education or new economic activities, his account is more ambiguous and simply treats such forms of status as if they were alien to the local community.

Zein explicitly states that while individuals entered and left the social system and while individual ownership of land and water rights was constantly shifting, the water wheel and the system of allocating rights connected with it persisted. Yet within the monograph Zein acknowledges that the “enduring” system of the allocation of rights which he describes came into its present form only at the turn of the century. As a descriptive convention, Zein’s assumption that the water wheel and the social obligations connected with it were a central cohesive force works well so long as his account concerns only those activities directly related to the water wheel. Leaks in the “closed” system show up as soon as other activities of the villagers are considered.

Robert Femea’s Shaykh and Effendi: Changing Patterns of Authority among the El Shabana of Southern Iraq[13] is another primarily functionalist monograph on an irrigation society, inspired by the explicit theoretical problem of changing patterns of political authority. At the time of Fernea’s fieldwork (1956-1958) in a small town of 3,000 persons 150 miles to the south of Baghdad, Fernea was primarily, if indirectly, interested in the Wittfogel thesis of the relation of irrigation with political authority. Essentially Femea’s approach is to provide a general ecological and social historical description of southern Iraq, with an emphasis upon the Al Shabana tribe. This is followed by an excellent general account of tribal organization. Although the Al Shabana tribal structure is characterized as “segmentary” by Fernea, he is a careful ethnographer and realizes that the lineage system by which tribesmen characterize their organization and obligations simply does not correspond to actual groupings.[61] The remainder of the study examines the changing patterns of authority of the tribal leadership under Ottoman rule, the succeeding period of the British mandate, and finally under the independent Iraqi regime. The authority of tribal leaders (shaykh-s) was most autonomous under' Ottoman rule and in fact was enhanced in the late nineteenth century by the system of land registration implemented by the Ottomans as part of wide-ranging tax reforms. These reforms enabled tribal leaders to register traditionally collective or “tribal” lands in their personal names, thus becoming major landowners and in many cases turning their fellow tribesmen into tenants and sharecroppers. Their authority was more restricted under British rule and, in more recent times, has been even more circumscribed in favor of irrigation engineers and other representatives of the central government. Nonetheless, tribal leaders have managed to maintain considerable- political influence as intermediaries between tribesmen and representatives of the central government.

Cambridge: Harvard University Press, 1970.

A principal contribution of Femea's monograph is its clear exposition of present-day tribal organization.[62] Femea adopts the conventions of functional analysis but, like Zein, does not allow his ethnographic account to be trapped entirely within his theoretical formulations. Fernea clearly depicts the significance of "outside" political forces for comprehending local authority structures, although he is less successful in indicating how individual shaykhs and their followers themselves viewed the successive political transformations which he describes and the way in which perceptions of change affected the action which they took. Attention to such a theme would have avoided at least some of the pitfalls of the layer-cake conception of history, in which social and cultural institutions are seen as unchanging over long, indefinite periods (that is, "premodern," "traditional"). Suchahistor- ical notions are encouraged by the conventions of functional analysis, an approach that Fernea in fact has abandoned in his more recent writing.[63]

Perhaps the most incisive account of the limitations of the functionalist approach was developed by the British anthropologist Emrys Peters. Peters has worked in two regions in the Middle East. As a student of E. E. Evans-Pritchard, he worked with the Bedouin of Cyrenaica, Libya, shortly after the Second World War. The principal results of that research have been a series of articles exploring the concept of segmentation and the feud (see Chapter 5). His most direct inquiry into the more general issue of functional theory is contained in two articles he wrote on a Shi^cf Muslim village in south Lebanon, where he worked for a year in 1952 and again in 1956. The first analysis was published in 1963, although it had been presented informally at scholarly conferences prior to his return to Lebanon in 1956. A thorough "recantation" of his 1963 article then appeared in 1972.[64]

His earlier analysis is of more than historical interest, for it indicates in detail the social and economic organization of the village. In his first account, published in 1963, Peters used the "equilibrium" assumption to which I earlier referred. Of course, such a notion does not imply that individuals are frozen in place. Peters perceived that at least some individuals were highly mobile but that the structure of the society—that is, the orderly arrangement of roles and statuses within it—remained the same. Revolutions against the social order did not bring about the collapse of the social order; rather, they provided opportunities for powerful persons or groups of persons to replace others whose power and influence had diminished.

As Peters writes, there were many characteristics of the village he studied that led him to believe that an equilibrium model of its social structure was appropriate in 1952 and for at least three generations prior to that time. In the first place, the village was territorially discrete, located on a high promontory with a cliff on one side and sharply delineated

borders on the others, so that it was set off sharply from the other villages in the region. Its population of eleven hundred people appeared prosperous and largely self-sub sistent. There was an abundant rainfall of fifty to sixty inches from November through March, though irrigation was needed for the rest of the year. The luxurious array of crops included tomatoes, eggplant, peppers, beans, peas, carrots, cabbage, apples, oranges, quince, radishes, lettuce, cucumbers, plums, figs, pomegranates, sugar cane, olives, and grapes. Many villagers also had small herds of sheep and goats, although most of the meat consumed in the village was purchased elsewhere.

Another reason that Peters conceived the village to be self-contained was the emphasis which the villagers themselves placed upon landownership as a criterion of social identity. Villagers asserted a special identity with their land and spoke of themselves as being its “sons.”

In his 1963 article, Peters accepted the villagers’ self-categorization into distinct groups as an adequate model of the actual social structure. Essentially, this division was composed of the “Learned Families,” the commercial traders, and a peasant proletariat. The village was predominantly Shl^cf Muslim, although a few Christians were also present. Since nearly all of Peters’s analysis concerns the Muslim population, I will concentrate upon it as well. Membership in the three Muslim cate-

FIGURE 3-2 A village in southern Lebanon, 1950s. (From Emrys L; Peters, "Aspects of Rank and Status among Muslims in a Lebanese Village," in Mediterranean Countrymen, ed. Julian Pitt-Rivers [Paris and The Hague: Mouton & Co., 1963], p. 168. Courtesy Emrys L. Peters and Mouton & Co., Publishers.)

gories was primarily related to landownership and use and was reflected in patterns of dress, seating arrangements on social occasions, and other readily visible signs of comportment.

The first group as seen by the villagers, the Learned Families, was composed in part of the descendants of the Prophet’s great-grandson ^cA1L These were called sayyid-s. The remainder of this group were known as shaykh-s. They claimed descent from an ancestor who fought alongside the Prophet’s grandson at the seventh-century Battle of Karbala, an incident which is crucial to Shi^cI history. These families were called “Learned” not because they necessarily were educated but because they claimed a superior social and religious status based on descent. Some members of the Learned Families had been to traditional Shf^cf centers of learning in Iraq. This aristocracy constituted about 20 percent of the population of the village. They intermarried among themselves and with families of similar status in neighboring villages and managed to control local political offices. The Learned Families tended to live in better houses than other villagers, performed no manual labor on their land

as another indication of their status, and were said by the villagers to own the majority of the land.

Although the Learned Families claimed a common identity based upon descent, it was possible for persons from the other categories to assimilate to them through persistent effort and the expenditure of wealth in ways approved by the leaders of the Learned Families. Peters provides several specific examples of individuals in the other categories who had become wealthy and powerful and who, through demonstrating proper deference and a willingness to become publicly known as clients of the Learned Families, could put forward a claim to Learned Family status themselves, at least in certain contexts. In his 1972 account, Peters acknowledges that he did not see such social mobility as a force in the realignment of sets of social relationships, but only as a movement of persons within a fixed social system. [65]

The second important group were the commercial traders. These were not so clearly defined as a category, although they cultivated small gardens, tended to wear European clothing, and belonged primarily to two patronymic groups. Together, they constituted another 20 percent of the Muslim population.

The third and largest group was the peasant proletariat, the remainder of the population with the exception of a few Christian households. Peasants worked their own land and served as laborers for the lands of the Learned Families. In his 1963 account of the village, in which he saw status as part of a single, overriding system related to the land, Peters regarded the high rate of migration among the peasant proletariat merely as an indication of pressures upon the land. If persons of peasant origin migrated in large numbers to North and South America, Great Britain, and West Africa, it was simply because of the lack of locally available land, and not because of any other factor. In his later study Peters acknowledged that earlier he had largely neglected the improved access to schools of many of these emigrants, the substantial remittances they sent back to the village, and, especially in the case of those who remained in Lebanon, the active influence they maintained in village affairs. Because the villagers insisted to Peters that ownership of land was the key to understanding stratification, he had directed his research strategies primarily toward this topic and assumed that the social structure he so construed was stable over time.

Peters confirmed his earlier conception of a stable social structure through the analysis of two behavioral indices. One was the performance of the annual mourning (ta^cziya) plays commemorating the martyrdom of the slaying of Husayn, the Prophet’s grandson, by Sunni Muslims in the year 680. Throughout the regions in which Shi^cf Islam predominates, such reenactments were until recently performed during the first ten days of the Muslim lunar month of Muharram, in some circumstances by professional actors and sometimes by the villagers themselves. In the village studied by Peters, the roles of the Shf^ca, supporters of ^cAli (the Prophet’s son-in-law) and descendants of the Prophet, who of course

lost the battle and suffered martyrdom, were performed by the Learned Families. The roles of the victorious but treacherous Sunni Muslims were performed by the peasants, thus dramatically symbolizing what Peters took to be fixed elements of the status of and a symbolic “warning” to the peasants of the anarchy that would prevail if descendants of the Prophet were not allowed their rightful place in the social world.

Peters also considered the fact that despite some signs of discontent, almost everyone in the village exhibited some form of deference to the Learned Families, and that in elections for various local offices, the candidates supported by the Learned Families invariably won. Because the Learned Families were a minority, their own votes were insufficient to win an election, but through the manipulation of other village factions, they always managed to win.

Soon after his initial period of fieldwork, Peters saw the architecture of what he had assumed to be a stable system of social structure disintegrate. In 1953, there were municipal elections throughout Lebanon. One of the peculiarities of elections in the Lebanon of this period was that persons could choose to vote where they wished, although most franchised persons chose to vote in their natal villages. This fact in itself renders suspect any account of local politics which considered only the presence of persons in the immediate geographic locale of an electoral region. No village in Lebanon is more than half a day by bus from any other village, so that persons not regularly resident in the village but who had ties with it could easily participate in its elections. In the 1953 elections the candidate supported by the Learned Families was soundly defeated and, moreover, the Learned Families were unable to exert significant political influence from that time on. The winner in the 1953 election was still in office fifteen years later and had been instrumental in bringing a new school to the village, a medical clinic, a paved road, and education for women, among other significant transformations.

The value of the 1972 study by Peters lies in his meticulous account of why his early analysis and implicit theoretical assumptions were invalid. As Peters writes, his principal difficulty was his acceptance of the global social categories used by the

villagers themselves. This directed his attention away from certain major economic and status transformations which were then occurring. These were not perceived as patterned regularities by the villagers themselves, but, Peters argues, an understanding of them was essential for an adequate social anthropological account of village structure. The villagers asserted a central unitary value in the ownership of land, said that the Learned Families were the major landowners, and accused the Learned Families of coveting the land of the other groups. This obscured for Peters the fact that a large number of Learned Families were poor and, moreover, were handicapped in that their status obliged them not to work their own land. Being]

hard pressed for funds, they found themselves selling their land to an emerging group of commoners whom Peters calls the “Professionals” in his 1972 article.)

These were the children of commoners who had attended American missionary schools in the region and who were thus often enabled to acquire further technical and university training. For reasons of their status, the Learned Families were compelled to send their children only to Shi^ci religious schools, a restriction that the commoners could easily ignore. Hence a number of commoner children became 1 prominent doctors, lawyers, merchants, bureaucrats, and managers in Lebanon and | abroad. Likewise, the commercial skills acquired by peasant emigrants familiarized 5 them with modern administrative techniques. These persons had considerable 1 money for investment and put at least part of it in village lands. Yet, while the Learned Families maintained their land in nonmarket crops, the Professional and trader classes were more aware of the possibilities for export crops and invested in such things as apples. By the time the Learned Families became aware of the income to be derived from such crops, the market value had diminished so that much of the initial advantage of investing in them was lost. Nor did the Profes- 'i

sionals choose to make the heavy investment necessary to acquire merit in the eyes of the Learned Families.

In many ways, Peters wrote in his 1972 reanalysis, there was a disadvantage 'j, to the high rank of the Learned Families. Only a few of them were actually large ’> landowners. Poor sayyid-s and shaykh-s had to live on loans because it was beneath their dignity to work their own lands. Similarly, though as a group the Learned Families exhibited a high degree of literacy, this was almost exclusively acquired in traditional religious education. This limited their perception of and ability to benefit from modern economic and political opportunities.'

Moreover, the social networks and ties of patronage and clientship of the Learned Families showed sharp contrasts to those of the other two groups. The Learned Families tended to marry only among themselves or with persons of i

similar rank in neighboring villages. The peasant Professionals had weblike connections through marriage arid patronage with persons of many different walks of life J in Beirut and elsewhere—bankers, politicians, doctors, educators, emigrants, and 1 entrepreneurs—and used these ties to advantage in the acquisition of political j influence. The Learned Families were caught up in a narrow web of relations and ’

were pursuing what had become a defunct economic policy of investing their 5 wealth only in land, although the locus of significant economic activities had shifted elsewhere. The Professionals had acquired the training, the connections, and the resources which enabled

them to replace the Learned Families as the dominant social group. Furthermore, they were capable of enhancing the welfare of the community as a whole through the effective manipulation of these ties.

The error of Peters's first analysis, as he saw it, had been the attempt to fit all the facts of village life into a single pattern. In his reanalysis, he concluded that the "system" the anthropologist looks for is necessarily open-ended and must be explained at least in part by looking for historical transformations. The key components of status present in any situation must be looked at comparatively in order to be comprehended, both in different social settings and at different historical periods. The system thus described is open-ended, and its components become apparent by the historical analysis of shifts in power. Patterned regularities exist in such open-ended systems, but they are not the elusive and misleading single system presumed by the functionalists. As Peters wrote, the perplexing (for him) results of the 1953 election jolted him into a reconsideration of what he had thought to be a basic, enduring social structure. Through his reanalysis, he perceived that rank as perceived by the villagers operated differentially—that is, to the detriment of some members of the Learned Families and to the advantage of some persons in the other categories and that ownership of land was not of equal significance to all the villagers.

In fairness to Peters, few anthropologists in the 1950s and 1960s realized the full importance of the cultural and social impact of immigration and emigration, education, and exposure to the West and the ensuing feedback upon the political and cultural fate of the region. Even earlier in the century, to take only the countries of North Africans an example, the presence of large numbers of North African laborers in France led to the development of organized labor movements in the colonies and the coalescence of a nationalist movement. The same was true for the large number of North Africans who fought in France's armies, and a smaller but influential number of North African students who studied in France. More recently, in the 1950s and 1960s, political issues in countries such as Brazil, France, and West Germany related to problems of bicultural education can be traced directly to Middle Eastern immigrant populations. When such workers return to their country of origin, they bring with them changed notions of housing, marriage, family, and society. Their changing tastes in clothing, housing, and other commodities have contributed to the precipitate decline of many traditional crafts such as weaving, rug making, and the like. Whether their experience with the West is one of bitterness and disillusionment or one of partial liberation from some of the constraints of their own society, their lives are profoundly altered. Emigration is significant enough a phenomenon in countries such as Morocco, Algeria, Tunisia, Lebanon, Egypt, and Syria to affect the lives of virtually every town and village. Immigration into oil-rich countries such as Libya, Saudi Arabia, and the Gulf states (where immigrants sometimes outnumber local residents) has had a similarly profound impact. Additionally, it has only been in the last two decades that substantial numbers of school-age women have had improved access to higher education in many Middle Eastern countries. The consequences of such change are often delayed, which may be one of the reasons that Peters underestimated its importance in his earlier study, but as he realized in his reanalysis, its cumulative and long-range impact can often be profound. [19]

There are other aspects of Peters’s analysis that are explored in later chapters, but for the moment it is critical for its brief indication of certain features of village ! life in one part of the Middle East and for its unusually straightforward evaluation of the shortcomings of functional analysis and assumptions which imply that villagers, pastoralists, and townsmen live now or lived in the past in closed social worlds. In the ensuing chapters more satisfactory alternatives to such concepts are presented.

** 4. The Contexts of Pastoral Nomadism

As of 1970, pastoral nomads constituted only slightly more than 1 percent of the population of the Middle East, yet such nomadic societies have been more extensively studied by anthropologists than those in village or urban settings. There are major anthropological studies in English of pastoral nomads in Iran, Turkey, Somalia, Israel, Saudi Arabia, the Sudan, and Libya, as well as an extensive literature in professional journals.[1] Until recently, in contrast, the Middle East has been the only world region for which no equivalent range of studies has been available concerning its major populations, the peasants or settled “tribal” communities.[2]

A partial explanation for the disproportionate emphasis upon pastoral nomadism continues to be the romantic attraction to some anthropologists of nomadic life and virtues. There are also some more important theoretical and practical reasons. First of all, pastoral nomadism offers the appropriate conditions for social groups which conceive their identity primarily in terms of segmentary lineage organization, a subject which raises basic questions on the comparative study of society in the Middle East and elsewhere in the world.[3] A second reason is an anthropological concern with human ecology. Studies of pastoral societies contribute to an understanding of human adaptation to difficult environments,and to the constraints which ecological and economic conditions place upon social organization. A third reason is a practical one: Middle Eastern governments have been anxious to settle their pastoral populations for a mixture of political, economic, and humanitarian motives and consequently have often encouraged the work of foreign and indigenous anthropologists with pastoral groups.

Patterns of pastoral nomadism vary widely, even if considered in a strictly ecological dimension. Geographers interested primarily in land use, for instance, frequently make a distinction between horizontal and vertical nomadism. Horizontal nomadism refers to pastoral movements in search of water and pasture that occur throughout the year in roughly similar ecological regions, such as is the case with the camel-herding “noble” tribes of the Arabian peninsula and the Kababish Arabs of the northern Sudan, who have mixed herds of camels, sheep, and goats.

Vertical nomadism involves seasonal movement between complementary ecological zones, such as lowland plains for part of the year and mountainous regions for another. This form of pastoralism principally involves the herding of sheep and goats and is frequently combined with agriculture and the use of permanent settlements for part of the year. Among other regions, it is the most common form of pastoralism in Iran, Iraq, and Morocco.

in Sociology and Social Anthropology, 13 (Leiden: E. J. Brill, 1972); The Desert and the Sown: Nomads in Wider Society, ed. Cynthia Nelson, Research Series, 21 (Berkeley: University of California, Institute of International Studies, 1973), and the Equipe Ecologie et Anthropologic des Societes Pastorales, Pastoral Production and Society (London and New York: Cambridge University Press, 1978). Finally, Douglas L. Johnson, The Nature of Nomadism, Research Paper 118 (Chicago: University of Chicago, Department of Geography, 1969), is a useful geographical study which also contains a thorough bibliography on Middle Eastern pastoralism. The most original and provocative book to appear in recent years on pastoral nomadism and its relation to states and empires, and on the relation between political forms and Bedouin oral literature, is Michael E. Meeker, Literature and Violence in North Arabia, Cambridge Studies in Cultural Systems, 3 (New York and London: Cambridge University Press, 1979).

[2] Clifford Geertz, “Studies in Peasant Life: Community and Society,” in Biennial Review of Anthropology, 1961, ed. Bernard J. Siegal (Stanford: Stanford University Press, 1962), p. 17.

[3] On the significance of studying lineage organization in the context of pastoral societies as opposed to those of towns or villages, see Emrys Peters, “Aspects of Affinity in a Lebanese Maronite Village,” in Mediterranean Family Structures, ed. J. G. Peristiany, Cambridge Studies in Social Anthropology, 13 (London: Cambridge University Press, 1976), pp. 30-32.

For most anthropological purposes, classifications of pastoral nomadic groups based purely upon ecological considerations or type of seasonal movement are insufficient. Both in recent decades and in earlier historical periods, the political and social relations of pastoral groups with the peasant settlements, towns, and states that are on the periphery of zones of intense pastoral activity have been as important for their livelihood as pastoralism itself. Pastoral nomadism depends upon regular access to settlements for a variety of agricultural products and other goods that can be obtained through trade (or pillage) or, on occasion in the past, by force. Pastoral, agricultural, and trade activities are part of a single economic system articulated by various forms of social and political domination. These forms are complex and the participants do not fall readily into classificatory niches such as nomads, villagers, and townsmen. Both now and in the past, many tribes commonly have had both nomadic and settled components, and political leadership and movements

frequently have encompassed groups pursuing combinations of these forms of economic activity.[67]

*** Pastoral Nomadism: The Past and the Present

Some accounts of pastoral nomadism give the impression that only the political and economic transformations since the eighteenth century have significantly reduced it in scope. Actually, it has probably been the case that nomadic pastoralism has always been part of a larger system including agricultural, settled peasants, and trading urban centers. For no historical period is it possible to think of nomadic pastoralists as an autonomous society. The reasons for the seemingly irreversible decline beginning in the eighteenth century are multiple and vary considerably with region, but among them are the steady expansion of cultivated land to the detriment of lands available for grazing, the declining attractiveness of herds as a capital investment to merchants and other nonpastoralists, the disappearance of significant caravan traffic as alternative investments have become available, and the increasing ineffectiveness of nomads as a military force. Census figures for Iraq indicate the scope of this decline—in 1867 nomads constituted about 35 percent of the population as compared with only 2.8 percent, or 300,000, in 1970.[68] The beginning of the pronounced decline of nomadism varies from country to country, but in almost all cases the rate of decline brought about by large-scale economic and political shifts has been rapid.

The major factors involved in the decline of pastoralism are suggested by the case of Egypt, which in the early nineteenth century became the first country in the Middle East to experience a rapid expansion of agricultural production due to increasing involvement in the world capitalist economy and a consolidation of its central government under the reign of Muhammad ^cAH (1769-1848).[69] To increase agricultural production and tax revenues, Muhammad ^cA1I sought to settle the Bedouin tribes, and to this end he used a combination of tactics which met with varying success. One was to give land grants to Bedouin tribal leaders (shaykh-s) and to tax this land at a low rate. The drawback to this policy was that many shaykhs preferred to lease their land to peasants rather than induce their own followers to settle. Another technique was to appoint Bedouin leaders to government offices, keeping members of their families as hostages in Cairo to ensure their loyalty. In order to carry out their tasks and to enjoy the wealth which usually was associated with such offices, many of these leaders settled in towns and often built palaces for themselves as an indication of their new status. At the same time, they maintained a firm hold upon fellow tribesmen as their formal representative with the government and persuaded many of them to settle, exacting from them tax revenues and other obligations.

An associated tactic to encourage settlement was to allow Bedouin shaykhs to register uncultivated land in their own names, leaving them to induce their fellow tribesmen by whatever means available to settle and cultivate this land. The process of land registration was confusing enough to illiterate tribesmen (who often thought it to be a prelude to military

conscription) so that even when tracts of land were intended for tribes as a whole, tribal leaders found it easy to acquire personal title to such land and progressively to convert their fellow tribesmen into peasants and sharecroppers. A similar process occurred elsewhere in the Middle East, including the former Ottoman provinces of Iraq, Syria, and Palestine.[70]

Although the decline of pastoralism is a long-term phenomenon, many anthropologists recognize a qualitative difference in the sociopolitical context of nomadic groups prior to and after the imposition of sustained and effective central government control. William Irons's study of the Yomut Turkmen of northern Persia is typical of many studies in that he sharply distinguishes between land use patterns and sociopolitical organization before and after the effective imposition of such control in the mid-1930s.[71] Other anthropologistshave based their analyses entirely upon earlier sources. Notable among these is Henry Rosenfeld's account of the military and political role of pastoral nomads in northern Arabia in the nineteenth century and prior to the First World War.[72]

Rosenfeld's account is worth considering in detail, for it sharply delineates the inherent tension between the "tribal" social organization and loyalties of pastoral nomadic groups and the principles of leadership and authority associated with state organizations in the premodem period. "Premodem," like "traditional," is a difficult term to define. Here I use the term, as does Rosenfeld, to signify the period prior to significant Western military and economic penetration and its accompanying decisive impact upon political, educational, and other institutions. The terms "premodem" and "traditional" are often useful provided that it is kept in mind that what is "premodem" for a country such as Saudi Arabia (or even a region within a country) occurs historically at a very different time from what is "premodern" .for Egypt, the first country in the region to be subject to sustained European intervention.

The specific details of Rosenfeld's argument relate to pastoral groups in northern Arabiaj but his main theme is also useful as a starting point for considering the premodern political role of pastoralists in other regions of the Middle East. Rosenfeld argues that the scope of economic and political domination which any social group can exercise is limited by its form of social organization, especially of its military force, and that pastoral nomads are limited militarily because of their "kin-based" social organization. A corollary argument is that pastoral nomadic life contains fewer possibilities for the relatively permanent differentiation by wealth than is possible in settled milieus where, of course, "kin-based" or "tribal" social organization is also found. In the case of pastoral groups, consequently, there is more of a tendency for relationships among individuals to be egalitarian both in ideology and in practice than is the case in oases, villages, and towns. Parenthetically, it is misleading to equate "kin-based" with "tribal" social organization, as do Rosenfeld and many others concerned with pastoral nomads, for reasons which will become clear later in this chapter. For the moment, Rosenfeld's argument is at a level of generality for which a more precise use of terms is not crucial. Essentially, Rosenfeld discusses the different patterns of leadership and social organization among pastoral nomadic groups and the transformations from one form to another which occurred in the political context of the nineteenth and early twentieth centuries.

One possibility was for a Bedouin shaykh to possess only a limited form of domination over his fellow tribesmen, relying primarily upon informal persuasion. Ideologically, Bedouin shaykhs were (and still are) considered to be only the first among equals, although in practice they possess a greater control over resources than their followers which enables them to entertain lavishly and to have a web of relations with nontribesmen. To cite Burckhardt's aphorism: "A shaykh's orders are never obeyed but his example is generally followed."[73] Another practical limitation of the control of Bedouin shaykhs over tribesmen was that ecological exigencies required nomadic groups to break up into small units for large parts of the year and to move quickly to take advantage of available rainfall and vegetation. Pastoral groups coalesced into intertribal raiding parties, especially during the winter months when the search for water and pastures was less demanding than in other seasons, but most raids were carried out by small groups which had neither permanent members nor leaders.[74]

Nonetheless, pastoral groups in some circumstances had an advantage over the militia of settlements in certain irregular encounters, in escaping taxation, in disrupting caravan traffic, and in carrying out sporadic raids against outlying oases or agricultural settlements. Often the mere threat of a raid was sufficient to persuade a village, oasis, or weaker pastoral group to pay for protection in cash or kind. Often such payments were known euphemistically as "brotherhood" (khuwa) obligations.[75] Even the Ottoman government found it expedient to pay regular subsidies to nomadic leaders to ensure the safe passage of caravans (including those associated with the annual pilgrimage to Mecca) and to ensure the safety of the Damascus-Medina railroad. The railroad was completed in 1908 and destroyed by T. E. Lawrence during the First World War. The extent of such tribute depended upon the rapidly fluctuating strength of particular nomadic groups.

Given the dependence of pastoralists upon the produce and merchandise of settled communities and oases, the dominance of settled communities over nomads was a more common occurrence than was the reverse situation.[76] The possibilities were numerous, but usually pastoral leadership was fragmented or weak. Oases often control access to the only perennial source of water, needed by nomadic groups for the summer months. The leaders of oasis communities commonly sought to create rivalry among nomadic groups through subsidies and other tactics in order

FIGURE 4-1 Ja^cda camel driver. Hadramawt. South Arabia. Roads and trucks have profoundly transformed the life of nomadic pastoralists. (From Freya Stark, Seen in the Hadhramaut [London: John Murray, Publishers, Ltd., 1939], p. 3. Courtesy of the author and publisher.)

to keep them in a state of dependence. Also common, however, was a situation of uneasy peace between oasis dwellers and nomads, in which pastoral groups exchanged their animals and animal products (and services as transporters of goods and persons) for dates, grains, coffee, salt, cloth, guns, and ammunition and established ties with cultivators that allowed them to forage their animals on harvested fields. Some pastoralists owned date trees and land in these settlements or had settled kinsmen on whom they depended to facilitate their economic transactions.

In some circumstances, as Rosenfeld explains, ambitious Bedouin leaders sought opportunities to acquire firmer control over trade and oases than was possible through their influence as “first among equals” with their fellow tribesmen. Initially, the ruler of an emerging tribute state acquired control of oases and settlements with the support of a kin-based militia of fellow tribesmen but gradually replaced these with mercenaries and slaves, whose livelihood depended directly upon their obedience to and support of the ruler. Such a shift in type of authority usually was marked by the settlement of a Bedouin leader in a key town or oasis and a growing identity of his interests with those of leading merchants and a Bedouin elite, as opposed to the interests of the majority of his fellow tribesmen who remained nomadic pastoralists. Nomadic groups and settlements peripheral to such a tribute state received no direct benefit from submission to it and hence sought to break away whenever possible. The militia of the ruler sought regularly through raids or the threat of raids to force such nomadic groups and settlements to accept their protection.

Finally, Rosenfeld describes the features of a rudimentary state organization which he calls episodic or expanding. In this form of state, kin-based nomadic groups are incorporated but only so long as their interests coincide with those of the ruler of the state and his associates. This occurred when tribal levies were engaged in raiding and military activities directed against external objectives. As soon as such a state ceased to incorporate new settlements or tribes, these levies were not needed and kin-based nomadic groups again sought whenever possible to break away. One example is the Wahhabi, or “Unitarian” religious movement in Arabia, associated with Saudi Arabia’s ruling dynasty.[77] Wahhabi expansion began in the mid-eighteenth century with a raid which involved only seven men and camels, although the movement grew until it encompassed most of the Arabian peninsula by the end of the century. With each successful expedition, more tribesmen and others adhered to the Wahhabi state. Participants in successful expeditions were allowed to distribute four-fifths of the booty among themselves, with the remaining fifth going to the central treasury. This division was legitimated by the fact that it was the same practice followed by the Prophet Muhammad in the early stages of the Islamic movement in seventh-century Arabia. Both in the early phase of the Wahhabi movement and after its revival in the late nineteenth century, there were repeated difficulties in securing the loyalty of pastoral nomadic groups. After 1912, for instance, the Saudi dynasty sought with mixed success to settle nomads in about two hundred military and agricultural encampments. These encampments also served as points from which punitive raids could be undertaken against recalcitrant groups.

The basic tension described by Rosenfeld between authority in “tribal” societies and that exercised by the ruler of a state and his entourage continues to prevail to some extent in other contexts. In some of the states of the Arab/Persian Gulf, for instance, a common pattern prior to the 1950s was to have coastal rulers whose interests were closely tied to maritime commerce and who had only a nominal rule over tribal leaders of the interior, both pastoral and settled. The tacitly contractual loyalties of these leaders were maintained through subsidies, political intermarriages, and associated strategies. These tactics continue to be significant in the region, and tribal loyalties are far from being artifacts of the past.[78] The case is the same in Somalia, where nationalist politics prior to independence in 1960 and political activities since then under both democratic and military governments are significantly associated with lineage and clan loyalties, albeit in modified forms,[79]

The decline in pastoral nomadism has rapidly accelerated with the economic and political transformations that have occurred since the end of the Second World War and the influx of oil wealth into several Middle Eastern countries. For example, roughly 40 percent of Saudi Arabia’s population was nomadic in the 1950s, as compared with 11 percent in 1970. These figures do not reveal an even more significant shift of many nomadic groups from camel-herding to the raising of sheep and goats and a motorized nomadism in which trucks are used to facilitate seasonal migrations.[80] In Libya, 25 percent of the population was nomadic in 1962 as compared with 3,5 percent in 1970.[81] In some regions, notably those adjoining the Sahara and the Hom of Africa, this trend has been accelerated by the drought and famine which occurred in the early 1970s. Prior to the drought, 75 percent of Somalia’s population was nomadic; subsequently, most pastoralists had to be relocated in refugee camps as conditions worsened. The Somali government, like many other governments in the affected zones, responded to the crisis by taking steps to settle the pastoralists permanently and to seek to replace their clan and tribal identities with wider notions of ethnicity and nation.

The range of anthropological studies of contemporary pastoralists indicates that the process of settlement has a variety of consequences for social organization. The Yoruk of southeastern Turkey, who began large-scale settlement only after the Second World War, regard sedentarization merely as one of a number of economic strategies. As the economic rewards of pastoralism became increasingly marginal, households and groups shifted to settled life whenever possible, basing the decision to settle primarily upon economic considerations. This shift implied significant changes in the distribution of wealth (fixed inequalities of wealth are generally not as pronounced among full nomadic groups), but it did not result in any “massive change in formal institutions or social rules.”[82] A similar conclusion was reached by a study of the impact of a government project initiated in the early 1960s to settle the Bedouin of Egypt’s western desert, one aspect of which was to encourage participation in an agricultural cooperative movement in order to weaken traditional lineage loyalties. The socialist cooperatives quickly became popular but not for the reasons envisaged by government planners. Nomads regarded the cooperatives as offering an economically advantageous alternative to traditional herding practices, which

also permitted the strengthening of traditional lineage loyalties and leadership.[83]

In other cases, settlement is resisted even when there are economic advantages to abandoning traditional pastoral activities. This is reported to be the case for some of the camel-herding “noble” tribes of Saudi Arabia, who have opposed settlement because it often involved their mixture with nontribal groups considered their inferiors in the system of social stratification prevalent in the region until recently. Likewise, there was an initial reluctance to shift to the herding of sheep and goats because this was an activity traditionally carried out only by “weaker” (that is, inferior) tribal groups. But because the economic advantages to be gained from such a shift have enabled some of these weaker groups to raise their status, the reluctance of “noble” tribes to adapt themselves to the commercial raising of sheep and goats is rapidly diminishing, only to be replaced by the major ecological problems of lack of water and overgrazing of available pastures.[84]

*** Saudi Arabian Pastoralists: The Al Murra

So far in this chapter I have provided a general view of the historical, economic, and political contexts in which pastoral nomadism has occurred in the Middle East. The remainder of this chapter involves thicker ethnographic description, primarily of one group of pastoralists, the Al Murra Bedouin of the eastern deserts of Saudi Arabia. The Al Murra, numbering around fifteen thousand in 1970, are described in Donald Cole’s Nomads of the Nomads, which is based upon field research conducted from 1968 to 1970. Cole’s monograph is the only modem study of a pastoral group on the Arabian peninsula and for this reason is significant. Cole’s study has a further advantage for the purpose of using it as an illustrative case. It accepts most of the conventional anthropological assumptions concerning the social identity and social organization of pastoral nomads and other tribal groups, yet is thorough enough as an ethnography to indicate the shortcomings of these assumptions.

In 1970 there were still 400,000 to 1,000,000 pastoral nomads in Saudi Arabia—the ambiguity of this estimate in itself indicates one of the problems facing development planners even in the richer countries of the Middle East. The Al Murra have been one of the most “traditional” groups, in part due to the ecological circumstance that part of the grazing lands with which they are traditionally associated is unsuitable for a major shift to the herding of sheep and goats as has been undertaken on. a larger scale by other tribes. Likewise, only a few of the Al Murra had settled permanently as of 1970.[85]

The Al Murra groups that Cole describes in detail are primarily engaged in subsistence camel-herding, so that their activities are closely tied to ecological conditions. In the course of a year, Cole reports, the Al Murra range over some 200,000 square miles of Saudi Arabia, occasionally crossing its boundaries to go with

FIGURE 4-2 Al Murra migrations, early 1970s. (After Donald P. Coie, Nomads of the

Nomads [Chicago: Aldine Publishing Company, 1975] ,p. 29. Used by permission.)

their herds into Kuwait, Iraq, and South Yemen. If only their major moves are considered, most tribesmen travel some 1,200 miles yearly with their herds; together with more limited moves from temporary encampments they travel a total of up to 3,000 miles annually in search of pastures and water for their herds.[86] These movements and the rhythm of social life vary considerably with the seasons.

Because of ecological conditions, migratory patterns also differ from year to year. Cole describes the following movements for a year of relatively abundant rainfall. In the fall, which usually lasts from mid-September through December or January,[87] the Al Murra move some 200 miles to the southwest of their summer camps to the “Empty Quarter,” a region particularly associated with the Al Murra and devoid of permanent settlements. Temperatures are relatively moderate in this season—95°F at noon as compared with up to 120°F in the summer. Tents, the basic household and herding units, are widely dispersed during this season. The 40 tents of the lineage with which Cole lived in 1968, for example, were spread out over 4,000 square miles, with a distance of roughly 15 miles between tents. Every few days, each of these tents was moved in order to take advantage of the sparse vegetation.[88]

During the last days of the fall, the Al Muna carefully follow reports of where rain has fallen. Annual rainfall varies from 10-100 mm (1/3-4 inches) and occurs in highly irregular patterns. Reports on rainfall are frequently imprecise or conflicting, so such news is carefully sifted and discussed. Now that pickup trucks are used to reconnoiter for water and occasionally to obtain it, the danger of herd loss through lack of water is somewhat reduced, although wrong moves still have serious consequences.

The winter pastures of the Al Murra are 400 to 600 miles to the north of the general are£ of their fall encampments. Once rains are reliably reported in the north, the Al Murra move rapidly, frequently as much as 15-40 miles daily, so that the entire move is accomplished in under two weeks. These moves usually involve a more intense cooperation among tents than occurs during the earlier months. Moves are not formally coordinated, but clusters of tents, called dar-s,[89] are formed whose members are often related to each other through affinal ties, or ties through marriage. The Bedouin explain that when such ties of kinship exist among women, visiting and cooperation among them is facilitated because their fathers and brothers are in the other tents, which otherwise they would be unable to visit. According to Cole, the component households of a dar do not share

herding responsibilities, but the men commonly gather for the one cooked meal of the day. These camping units also frequently share the expenses of hiring a truck to transport their women and household goods during the move to winter pastures.[90]

Rainfall is relatively abundant in the winter and water can often be collected from the ponds that form in the desert. The water requirements of camels are considerably less in this season than at other periods of the year. Depending on climate, camels can go from four to six weeks without drinking in winter, as opposed to only four days in the summer.[91] Grazing land is also relatively abundant, with access to land being on a first-come, first-served basis, unlike the carefully regulated seasonal rights to land and migratory routes reported for the nomads of south Persia.[92] Because the Al Murra and neighboring tribes are physically more concentrated during this season than at other times, social life is more intense, with frequent visiting and feasting among the Al Murra and neighboring tribes. Al Murra princes (who do not migrate with the tribe) and non-Bedouin dignitaries also visit during this period. Traditionally, winter was also the season of intense, and now banned, intertribal raiding. Pastoralists carefully regulate the breeding of their animals in this period, so that calving takes place when grazing is abundant in the late fall and early winter.

The end of winter is marked by gradually increasing temperatures and the withering of winter vegetation. Since seasons are determined by the climate and not by abstract calendrical notions, spring is not an annual occurrence in the climate of Saudi Arabia. The Bedouin consider spring to occur only in those years when there are fresh pastures for a few weeks in January or February.[93]

From March to June, the Al Murra return to the area of their summer pastures. Lineages usually camp together during this period around wells which are jointly owned or controlled, although rights to use these wells and the grazing around them are often granted to household groups that do not form a part of that lineage. Camp composition varies from year to year, depending upon ecological conditions and the quality of relations prevailing among specific household units. Grazing land is scarce during this season, herds lose the fat which they may have accumulated in the winter, and the problem of securing adequate water supplies becomes more difficult with the passing months.[94] _

So much for an account of the migratory cycle of the Al Murra. As with other pastoralists, the activities of the Al Murra and their social organization are closely tied to and constrained by the circumstances of ecology and climate; although, as indicated previously, wider economic and political considerations have been_of equal or greater significance both now and in the past. Thus for many of the Al Murra, the work associated with herding constitutes only part of the economic activities in which they are engaged. In addition to the complex patterns of exchange with towns and villages in which some Al Muna participate as middlemen, many households also receive income from occasional wage labor in towns and oil fields and monthly stipends from participation in the Saudi Reserve National Guard. Politically, of

course, the relations of the Al Murra with other tribes, settlements, and the government significantly affect the availability of pastures, water, and migratory routes.

How do the Al Murra themselves conceive of their social organization and what constitutes an adequate anthropological description of this organization and the values upon which it is based? Cole's account centers upon the way in which the Al Murra explain their social identity to themselves and to outsiders. As with many other anthropologists who have studied pastoral groups, Cole does not distinguish clearly between the ideology of the social order maintained by the Al Murra themselves, which emphasizes the equality of all tribesmen and the lack of permanent leadership, and the social anthropological descriptive accounts and analyses of that order. The importance of distinguishing between these two modes of explanation will progressively emerge in this chapter and the next. In any case, the locally held ideology of the social order constitutes an important element of any explanation. As will also emerge, the Al Murra ideology of their social order has many elements in common with those held by other "tribal" groups in the Middle East; for Cole, the Al Murra provide an example of segmentary lineage organization.

Cole's account of Al Murra social organization centers upon five distinct units: the tent, or household (bayt); the camping cluster (dar), mentioned earlier; the lineage (fakhd, which literally means "thigh"); the clan; and the tribe as a whole. These last two levels of society are both called gdbila in Saudi Arabic.

On an abstract level, the Al Murra consider _themselves related through patrilineal descent from a common ancestor. For the Al Murra, all the basic units of society except the camping cluster (dar), which is ideally built around affinal ties, depend in principle upon the relation of persons to each other through a grid determined through common patrilineal descent. These relations can be conceived in terms of a downward-branching diagram like Figure 4-3. At the top of the diagram is an ancestor common to the entire tribe. The Al Murra consider this ancestor to be a quasi-mythical "personage who is said to have lived before the beginning of Islam."[32] Clans, of which the Al Murra presently have seven (not all of which are shown here), also have common patrilineal ancestors who unite all their members. The same thing occurs at the level of lineages, although in this case the common ancestor often is a historical person who was known to elder tribesmen. Of course, such an ideological representation of tribal social organization is not necessarily based upon actual historical persons and is used primarily to explain contemporary

social relationships. Ancestors not needed to provide links between actual groups are quickly “forgotten,” just as other linking forebears are “remembered” when realignments in present-day groups require the existence of a common ancestor to give form and legitimacy to their cooperation. The social obligations that the Al Murra feel are attached to identity (in principle) within this genealogical grid are explained below. _

The tent, or household, is the basic social and economic unit among the Al Murra. There is a range of variation in the composition of tents. A common pattern, for instance, is for an economically viable tent to include an older man and his wife—polygyny, though legally permitted, is relatively rare in practice—their sons and the sons' wives if the sons are married, and their children. The exigencies of herding and domestic life make it difficult for a tent to consist only of a conjugal pair and their children. A moderately prosperous tent often possesses fifty to seventy-five milk camels which must be herded near the tent, twenty to twenty-five pack camels used for carrying the goods of the household and which can graze at greater distances, plus a number of riding camels, giving a total of over one hundred camels. When a household does not have sufficient personnel for herding and the associated tasks, it must hire personnel from other tents or pastoral groups or else entrust some of its animals to other tents.[95] An inability to do so for economic or other reasons jeopardizes the viability of a tent. Another consideration is that the men and women of a tent individually own its animals, although the animals are jointly herded, with the adult males coming to common agreement on pastoral movements. When such agreement cannot be reached, the tents split up. Similarly, if a tent loses large numbers of animals through disease, drought, or other natural disaster and has no adequate supplementary sources of income, it loses its viability as an economic unit and must choose either settlement and agricultural labor or working as subordinates for other pastoralists.

The lineage, the next level of integration of Al Murra society, is a more abstract unit. Cole defines it as "all the people who are descended [patrilineally] from an ancestor who stands about five generations removed from the present adult generations."[96] However, the composition of lineages is more complicated than Cole's definition suggests.

First, let me specify in what ways the lineage is a more abstract social unit than that of the tent. In practical terms, lineages ordinarily camp together only in the summer, usually around wells to which they claim customary rights. Lineages also possess common camel brands, although as stated, ownership of animals is vested in individuals. Such summer encampments are not necessarily exclusive. Tents from other lineages frequently are allowed, just as tents of a lineage may seek to obtain water rights with another group (for example, one with which they have affinal ties) when it is to their advantage.[97]

There are no specially appointed leaders or councils within the lineage, although on occasion it may be represented informally by a mutually agreed-upon spokesman. Most decisions, such as how to defend water rights, are made through an informal consensus.[98] Cole reports that marriages generally occur within lineages, although he provides no clear account of how marriage strategies may vary with status and wealth. In some cases, a marriage contracted with a person of another lineage can give access to needed water and pastures; in other cases, it may cement a useful political alliance. These are important points to consider, for they indicate the inadequacy of assuming that alliances and political obligations are determined primarily by the ideology of patrilineal descent. For instance, the Al Murra told Cole that members of a lineage are jointly responsible for the actions

FIGURE 4-4 Al Murra herder and younger brother. (From Donald P. Cole, Nomads. Courtesy of the author.)

of its members and must seek revenge for an attack upon any of them. Yet in discussing the camping cluster (dar), whose membership is not determined by agnatic (patrilineal) ties, Cole states that each member of a day has an obligation to defend another "against the attack of even his closest male relative."[37] Such inconsistencies indicate the insufficiency of anthropological analyses which are confined to presenting the ideological claims of members of a given society, although such statements are, of course, important in themselves. For the moment I simply call attention to this problem, for it is discussed in detail in the next chapter.

How an essentially ideological claim of this sort can come to resemble the actual norms for action that are followed—that is, how people can come to accept the social obligations associated with such claims—is complex. One crucial requirement lies in the possibility that membership in a lineage can be acquired by means other than birth and subsequently accepted as of "the same" sort of membership as that acquired by birth. There are several reasons why individuals from other Al Murra lineages and from outside the Al Murra entirely often seek assimilation. Occasionally an individual breaks with his own lineage because of a serious dispute and seeks to identify with a different lineage. At other times, a man from a lineage, poor in camels, seeks to marry a woman from a wealthier lineage. Particularly if the wealthier lineage is short of manpower, such an alliance will often be encouraged, provided that the man agrees to live with his wife's lineage instead of his own. Eventually such a man identifies himself primarily with the lineage of his affines rather than his own, although only his grandchildren may "really" be considered

p. 63. part of the lineage. Similarly, a man from a weak lineage may seek to join a more powerful one.[38]

Such shifts in social identity also occur at the level of entire lineages, again indicating the flexibility of claims to patrilineal descent to accommodate contemporary and emerging social realignments. For instance, the lineage with which Cole spent most of his time between 1968 and 1970 was divided into two major groups. One consisted of thirty-five tents whose members were camel pastoralists. The other group was composed of sixteen tents of sheep and goat pastoralists who spent the entire year in northern Arabia. The latter had little to do with the camel pastoralists, and other lineages considered the two groups to be genealogically separate. Shifts of identity are also linked to economic activities and political influence. As has already been indicated, the Al Murra claim that all lineages and members of the tribe are "equals" does not stand close examination. "Weak" lineages are considered to be genealogically separate from "stronger" ones, although as the economic condition of such groups improves in relation to that of other lineages, over several

generations genealogical explanations for their “inferiority” are progressively abandoned by the members of other lineages.[39]

The next two levels of Al Murra social organization, the clan and the tribe, are both known as gabila. This entails no confusion, as the Al Murra rarely think of these “levels” in abstract terms; rather, they refer to the names of specific groups. Thus each of the seven Al Murra clans contains between four and six lineages. Some clans have princes (amir-s) associated with them; the others must depend upon the amir of another clan for assistance in dealing with the government and settling disputes. The clan plays no direct role in the organization of pastoral nomadic activities, but the Al Murra state that clan identity plays an important role in political disputes. No specific examples are provided by Cole, but the Al Murra claim that individuals and lineages of a clan “automatically” lend their political support to others in the clan in disputes with outsiders. Clans, in turn, are said to form coalitions with other Al Murra clans, although these coalitions do not follow the lines suggested by segmentary lineage theory, in which closely related clans should unite against any provocation from a member of a genealogically more distant group.[40]

Finally, the Al Murra tribe as a whole is a significant political and social unit, The tribe has its own myths, legends, and traditions; marriages are virtually all within it; the tribe has customary (although not formal) identification with certain pasture areas; and, most importantly, no individual in the tribe considers approaching the government on any major matter without the “permission and collaborative support of his tribal leaders.”[41]

[3S] Ibid., p. 88.

[39] fbid., pp. 89, 90, 93. Cf. p. 102, where Cole contradicts this recognition of the inequality of wealth of lineages by saying that they are all “roughly equal in power and wealth.”

[w] Ibid„ pp. 91-93,103.

[41] Ibid., p. 94.

*** The Ideology of Equality: Further Considerations

The role of the tribal leaders (amirs) emphasizes the difficulty of regarding the Al Murra as an “egalitarian” society in the past or in contemporary circumstances without exploring the meanings of “egalitarian” in specific contexts. By tribal ideology, Al Murra amirs are only “first among equals,” “slightly differentiated” from other tribesmen.[99] Yet there is

substantial evidence of a pronounced inequality, despite the ideological claim to the contrary. A major role of the Al Murra amirs is to arbitrate disputes among the tribesmen and to serve as intermediaries on all matters, of importance with the government. They possess no formal authority in these roles, but their domination over fellow tribesmen is generally unquestioned. To perform these tasks effectively, the amirs and their households do not engage directly in pastoral nomadism or migrate with ordinary tribesmen. They live in tents or houses near the main towns and close to paved roads so that they can maintain effective contact with their tribal clientele and townsmen alike.

The amirs are wealthier than ordinary tribesmen, but a more significant difference is their ability to control or to have access to a wide range of resources that ordinary tribesmen can obtain only with their assistance. Although most amirs are illiterate, their sons and those of their close relatives have attended school. One amir, the paramount leader of the Al Murra, is also commander of the local unit of the Saudi Reserve National Guard, whose members meet for a few days each month. For this service, each guardsman receives the relatively significant sum of $100 per month. The largest number of guardsmen are selected from the paramount leader’s own clan, which again suggests that some Al Murra are more equal than others.

Another, significant indication that the amirs are more than “first among equals” is that the paramount leadership of the Al Murra has remained within the same lineage since the nineteenth century and has survived a number of major political changes. This ability to maintain political dominance over generations again suggests how misleading it is to regard the Al Murra ideology of equality and their claim that tribal leadership is achieved through personal effort as practical guides to their social and political organization. To maintain their_position, Al Murra amirs cement close ties with powerful outsiders. Unlike other Al Murra, the amirs and their close relations contract a significant number of marriages with outsiders and use the relationships established through such marriage? for political purposes.

Informally, the tribal leaders are referred to by other Al Murra as their “eyes” (dual, ^caynayri), a revealing term which stresses the role of the amirs as intermediaries with the government and with outsiders, for in Arabic the term also carries the connotation of “spy” or “informer.” Although the Arabic word is not as decidedly pejorative as these English glosses may suggest, it does emphasize that tribal leaders owe their positions in part to “outside” interests.[100]

To conclude this chapter, let me more sharply delineate the drawbacks to using the shared ideology of equality among tribesmen as a guide to the relationships which actually prevail by briefly describing the Lur-s, a sheep- and goatherding tribe in western Iran.[101]

Like the Al Murra of Saudi Arabia and many other tribal groups, pastoral and nonpastoral, throughout the Middle East, the Lur-s consider themselves to be political equals. They maintain ideologically that success as a herder is determined by personal qualities and luck. Yet, as their ethnographer indicates, the probabilities are high that the wealthiest 10 percent of the population will be able to maintain or increase their wealth, while the remaining 90 percent will have difficulty in maintaining economic viability. In the sense that the Lur-s possess “no acknowledged leaders, no officers, and no named ranks,” they are equal.[102] However, the majority of the population requires economic patrons from the upper strata of society. The upper strata of society control larger herds, require labor for their herds, and can provide work and salaries for those of the lower strata. Lower strata members have fewer animals, must work for others to make up for their lack of sufficient capital in animals, and are usually obliged to offer the labor of their sons to larger herd owners, so that control over their sons is weakened.[103] Animal mortality figures provide an index to the consistent and marked difference in control of economic and political resources between the upper and lower strata of Luri society. The mortality rate for animals owned by the lower 90 percent of the population is 50 percent higher than that for the upper 10 percent.[104]

Luri tribesmen claim that as equals they are free to opt out of dependent contractual relationships, as Black points out, but doing so essentially means that they must find another patron, which is not always easy to do. The situation of inequality described by Black may be more extreme than others elsewhere in the Middle East, but it calls into question the adequacy of accounts of tribal society which present the locally maintained ideologies of equality as substitutes for social anthropological description. The inequalities of wealth among the Al Murra as described by Cole do not appear as great, but the same practical inequality exists: There are dominant individuals in a few lineages who control access to the government over important matters and effectively allocate jobs and other economic benefits. Other tribesmen consistently lack such resources.

This chapter’has indicated some of the reasons why there has been a pronounced emphasis by anthropologists on pastoral nomads in their study of the Middle East. I have emphasized shortcomings to considering Bedouin society as essentially “closed” and stressed the need to recognize and study the sustained and necessary ties between pastoralists and nonpastoralists, both in historical and present-day contexts. Ecological conditions place significant constraints upon pastoral nomadic groups and their social and political affairs, but I have indicated reasons why the wjder political and social contexts in which pastoral groups exist are of equal if not greater significance.

By providing an extended example of the social organization of a single pastoral group, I have emphasized that ethnographic description necessarily implies a set of theoretical assumptions and have indicated the problems associated with certain types of anthropological explanation. The next chapter examines these issues in more detail and relates them to the more general issue of the cultural nature of social identity.

* Part II: Meaning and Society

** 5. What is a Tribe?

*** Ideologies

In current popular usage, the term ideology often acquires the connotation of a system of illusory “unreal” beliefs concerning the nature of the social (or economic or political) world. The notion that ideologies are illusory is unfortunate and contrary to how the term is used by most sociologists and social anthropologists, who regard ideologies as significant and irreducible components of any cultural order. Ideologies inform social practice and provide it with meaning. The problem is to specify more precisely what is meant by ideology and its relation to society. The authors of such a classical discussion as The German Ideology insisted that ideologies shape and in turn are shaped by the particular social, economic, and historical formations in which they occur.[1] Regardless of the attitude of social theorists today toward contemporary versions of Marxism, the central problem posed by Marx of the relationship between ideology and society continues to inform contemporary social thought. The primary theoretical issue is how the relation between

*Karl Marx and Frederick Engels, The German Ideology, ed. C. J. Arthur (New York: International Publishers, 1970 [orig. 1846]), esp. pp. 46-47. This general principle holds not only for what might be termed social knowledge but also for the underlying assumptions of scientific thought as well, despite the popular notion that “science” is somehow immune from social vicissitudes. See Barry Barnes, Interests and the Growth of Knowledge (London and Boston: Routledge & Kegan Paul, 1977).

RF ideologies and social forms should be described and elaborated, not whether such a relationship exists.

In the past, many sociologists of knowledge have been concerned principally with those ideologies or beliefs that are consciously elaborated and maintained. Such ideologies, especially in the political domain, are of undeniable importance and merit intensive analysis. Yet the term ideology encompasses a wider set of notions than formal ideologies alone. Anthropologists and many other social theorists are additionally concerned with what might be called practical ideologies, sets of beliefs constituted by largely implicit shared assumptions concerning such basic aspects of the social order as notions of tribe, kinship, family, person, sexuality, nation, religion, and world-view.[105] Most

of these notions overlap in various ways and some are more encompassing than others. World-view, for instance, is one of the broader concepts and is used by anthropologists to designate shared cultural assumptions concerning the overall nature of the social order. Many of the practical ideologies remain incompletely systematized by those who maintain them, although forms of conduct such as patterns of naming, marriage, residence, and ritual can be used to document them. The fact that many of these ideologies are so “natural” and taken for granted means that in ordinary circumstances they are not consciously or fully articulated. Thus Americans, in looking at their own beliefs and social forms, are jj not ordinarily prepared to elaborate their shared assumptions concerning family, sexuality, and the like. Or more precisely, to make the anthropologist’s task more intriguing, when some “natives” express formal beliefs concerning family, religion, and economic conduct, these beliefs may only obliquely account for the actual, implicit principles which form the basis of their practical ideology. The same is of course true of Middle Eastern and other societies. In dramatic instances, such as the officially Marxist Somali Democratic Republic, tribalism and lineage loyalties have been declared illegal and no longer to exist, yet through mundane but critical 5 indices such as patterns of livestock investments and the lineage composition of . J governments since the 1969 “revolution,” it can readily be demonstrated that lineage loyalties are thriving, although it is illegal to say so publicly in Somalia? 5

How formal and practical ideologies overlap and influence each other is one of the principal themes raised in the discussion of the idea of “tribe” in later chapters of > this section.

There are genuinely puzzling problems of analytical strategy and substance which concern the basic problem of the relation of ideologies to society. Notions of tribe, kinship, ethnicity, sexuality, and religion all constitute shared cultural J meanings, ways of making sense of the social world and "of informing action within it. All patterns of cultural meaning are generated, maintained, and often transformed through social use. If patterns of meaning are generated through social action, why do so many of them (such as notions of family) appear to remain relatively stable over long periods of time, in spite of the massive economic, political, and social transformations of many parts of the Middle East over the last half century? Or is it just that some patterns of meaning appear more stable, perhaps those practical ideologies so taken for granted that they are not fully articulated (and thus not subject to conscious manipulation). A related issue concerns the limits of ambiguity and multiple interpretations of symbolic statements and how such ambiguity often facilitates the accommodation of major social and cultural changes. In the last half century in countries such as Morocco, Iraq, and the Sudan, and only in the last decade or two in countries such as the Yemen and Oman, there have been massive changes in how people make a living, where they live, how they are educated, and what they expect from each other and from the state. The theme of change is pursued in historical as well as contemporary contexts because the scope of some changes in the past has often posed similar problems of the relation . of cultural meanings to social forms. Such issues are not only of major interest to social theorists, but they provide persons who live in rapidly changing societies with a means of assessing the significance of their own lived experience.

*** The Concept of Tribe

“Tribal” identities at first appear more exotic to Westerners than those based upon kinship, ethnicity, or religion and therefore serve as an apt introduction to a discussion of how ideologies relate to the social order. In part, tribal identities have appeared exotic due to the way in which some anthropologists have chosen to depict such social forms. That is why it is useful to discuss ideas of the “tribe” in writing about the Middle East before considering other bases of social identity. Of course, “tribal’’- identities do not occur in all Middle Eastern contexts, although there are significant nomadic and settled populations that are tribally organized throughout the entire region, from Morocco to Afghanistan.

The first thing to emphasize is that tribal identity, like other bases of social identity including kinship relationships and even citizenship, is something which natives (and sometimes ethnographers) make. People do things with such social forms; these forms do not exist merely as objects that can be torn from social and cultural contexts by anthropologists to be recorded and classified into typologies.[107] Such patterns of meaning change with historical situations. It makes a great deal of difference whether they occur in the context of strong or weak state organizations or a colonial society.

There are four principal forms in which people “make” tribal identity in the Middle East. These are: (1) the elaboration and use of explicit “native” ethnopolitical ideologies by the people themselves to explain their sociopolitical organization; (2) concepts used by state authorities for administrative purposes; (3) implicit practical notions held by people which are not elaborated into formal ideologies, and (4) anthropological concepts? These various notions of tribe are not entirely parallel. All but the last are actor’s notions in the sense that they are implicitly or explicitly held by participants in a society and used as a practical guide to some form of social action. The anthropologist’s notion of tribe is primarily for analytical rather than practical purposes, although the sociological “observer,” whether native or foreign, also participates in the “observed” society in a special sense and is engaged in the “practice” of theoretical discourse. It should be emphasized that •

although these various notions of tribe are separable for analytical purposes, in practice they are by no means mutually exclusive and frequently overlap each <

other. After briefly explaining these notions in more detail, I present two practical examples of them, drawn from Morocco and Libya.

Native, or locally held, ethnopolitical ideologies of tribal identity vary some- ;

what throughout the Middle East, but they are generally based upon a concept of :

political identity formed through common patrilineal descent. A major exception is the Tuareg of the Sahara, where “tribal” identity is based instead upon matrilineal descent. Political action in such tribes has generally been explained by anthropologists in terms of segmentary lineage theory. People in such tribes sincerely believe that the principles of segmentary ideology explain the essence of their political activity, although as Emanuel Marx points out, this is simply not the case? As I shall indicate in discussing the Moroccan notion of qbila (“tribe”), such §

ideologies are differentially elaborated by tribesmen, depending upon their social position. Individuals who are socially and politically dominant often elaborate such ideologies in complex ways and use them to solidify political alliances with members of other tribal groups and to enhance their own position vis-a-vis state authorities. Ethnographers working in tribal societies have frequently based their accounts of kinship relations and tribal organization on information provided by such socially and politically dominant individuals, although the notions of tribal identity maintained by ordinary tribesmen often differ significantly from such formal ideologies of the dominant.

[s] The following discussion is based upon Bourdieu, Outline; Talal Asad, “Political Inequality in the Kababish Tribe,” in Essays in Sudan Ethnography, eds. Ian Cunnison and Wendy James (London: C. Hurst & Company, 1972), pp. 126-48; and Dale F. Eickelman, Moroccan Islam: Tradition and Society in a Pilgrimage Center, Modern Middle East Series, 1 (Austin and London: University of Texas Press, 1976), pp. 105-21.

[6] Emanuel Marx, “The Tribe as a Unit of Subsistence: Nomadic Pastoralism in the Middle East,” American Anthropologist, 79, no. 2 (June 1977), 356; Philip Carl Salzman, “Tribal Organization and Subsistence: A Response to Emanuel Marx,” and Emanuel Marx, “Back to the Problem of Tribe," American Anthropologist, 81, no. 1 (March 1979), 121-25.

The second notion of tribe is based on its use as -an administrative device in contexts as varied as the Ottoman empire, Morocco, and other countries prior to and during the period of colonial rule, and a number of independent Middle Eastern countries. Administrative assumptions concerning the nature of tribes are generally based in some degree upon locally maintained conceptions, but modified for political purposes. Thus administrative concepts of tribe frequently assume a corporate identity and fixed territorial boundaries that many “tribes” do not possess and give privileges and authority to tribal leaders that are dependent upon the existence of a state organization and not derived from concepts of leadership as understood by the tribesmen themselves. In cases such as Morocco and the Sudan, the colonial powers formerly promoted “tribal” identities and developed tribal administration to a fine art in an attempt to retard nationalistic movements. In reaction, the postindependence governments of these and other countries have signaled an ideological

break with the colonial past by formally abolishing tribes as an administrative device, although such identities continue to be highly significant at the level of practical local administration.

Practical notions of tribe, the third analytical category considered here, are those implicitly held by tribesmen as a guide to everyday conduct in their relations between larger social groups. The term practical emphasizes that these concepts of identity emerge primarily through social action and not through abstract reflection upon the social order. Such notions are often difficult for anthropologists to elicit, for they are not always formally articulated by tribesmen in ordinary situations and because social alignments based upon these notions frequently shift. Practical notions of tribe and related concepts of social identity implicitly govern crucial areas of activity, including factional alignments over land rights, pastures and other political claims, marriage strategies (themselves a form of political activity), and many aspects of patronage. These notions are explained in detail in the examples which follow later in this chapter.

Finally there are the analytical conceptions of tribe held by anthropologists. A preliminary caution regarding these notions—I emphasize the plural—is in order. In both popular and anthropological usage, the concept of tribe figures in a variety ■of sociological, evolutionary, and ecological typologies. In some contexts “tribe” is even partially synonymous with “primitive,” a usage decidedly out of place in the Middle East.[108] This variety of meanings indicates that careful attention must be paid to the specific way in which the term is used.

The anthropological conceptions are primarily intended to make sociological sense of “tribal” social relations. Like the “native” conceptions outlined above— and “natives,” of course, also can be anthropologists—anthropological notions also exist for a purpose, usually that of acquiring a theoretical understanding of the cultural bases of social identity, but they parallel the uses of,native ideologies.

Anthropological notions of tribe are not more real than “native” conceptions or superior to them; instead they are intended as a more explicit form of knowledge of social relations.

There is a drawback to providing a general, abstract definition which ignores all of these various overlapping notions of tribe. What an ethnographer “sees" of social forms in any given cultural context depends upon such factors as whether informants attribute the ethnographer with an official capacity, whether the ethnographer is regarded as friendly or hostile or as possessing a greater or lesser degree of understanding of a society. As Pierre Bourdieu points out, ethnographers, whether “native” or from another cultural tradition, are almost inevitably perceived as “learned,” so that their questions nearly always elicit the most “learned” representations of society from informants themselves,, in accordance with their own conception of learning and of conscious literary tradition. In tribal societies such

learned representations generally entail the elaborate use of written or oral traditional (memorized) genealogies. While such ideological representations are important in themselves, they do not take into account the implicit practical cultural understandings of society which are so basic that (to paraphrase Bourdieu) they find expression only in silence.[8] The anthropologist’s problem is not simply to balance out these various conceptions of tribe in order to arrive at one which is more “real.” It is to achieve as adequate an understanding as possible of how persons in a given society conceive of social forms and use this knowledge as a basis for social action.

*** A Moroccan Example: The Bni Batdw

The Bni Bataw is a semitranshaumant, Arabic-speaking tribe of roughly ten thousand persons (as of 1960) located on the plains of western Morocco near the foothills of the Middle Atlas mountains.[9] Their livelihood derives from a combination of pastoralism with seasonal agriculture. Each fall they sow fields of wheat and barley on the plains; then they take their herds of sheep and goats to the forested foothills of the mountains where there is sufficient forage for the winter; although there are running disputes with the government’s forest guards over the use of these lands. In the past, the Bni Bataw often moved their herds far into the Berber-speak- ing highlands, but French colonial restrictions, and now the restrictions of the independent government, substantially limit the timing and extent of these annual moves. In the spring during March or April, depending upon ecological conditions, the Bnl Bataw return with their herds to the plains. Today most of the Bni Bataw

</right>

live in dwellings made of stone and dried mud on the plains and use their tents only in the winter transhumant months. After their fields are harvested in June, the herds are allowed to graze on the stubble in the fields. Water and forage become scarcer as the summer progresses. Eventually they are compelled to move with their herds toward their- winter pastures.

How do Bnf Bataw tribesmen conceive of their identity? Bm is an Arabic word literally meaning “sons of.” Bataw is simply a Berber word meaning “fragment.” Bni Bataw leaders and the government officially consider the tribe to be part of larger tribal “confederations,” but those larger groupings exist primarily as administrative 'entities and as ideological frameworks in which wider political alliances were concluded in the past. There is no historical evidence to indicate that these wider entities ever acted as a collectivity. Within the BnT Bataw itself, tribesmen speak of their identity in terms of agnation, a concept introduced earlier in the discussion of the Al Murra of Saudi Arabia. But how can tribesmen be “sons of a fragment” or the “sons of” the place names that are used to designate certain subgroupings of the BnT Bataw? The ideological nature of social identity becomes clear in the answer to this question.

Tribesmen explain their relation to each other and to outsiders such as anthropologists in terms of metaphors. Sometimes the metaphor is based on the parts of a tree—twigs, branches, and the trunk; at other times such parts of the human body as veins and arteries are used.

Ordinarily these metaphors are applied only in a general sense to the three “levels” of the Bnf Bataw. These are known abstractly as the rural local community (dawwar), the section (fdkhda), and the tribe (qblla). Members of such groups claim common descent or, more specifically, “closeness” to each other. Briefly described, the smallest unit of these levels is the dawwar. Literally the word means circle. the 1930s, tribesmen lived in tents throughout the year. Especially when they moved their herds into the highlands controlled by Berber-speaking groups, tribesmen pitched their tents in a circle, herding their animals into the center at night for security. Few groups camp like this any more, since the French effectively managed to limit most intertribal hostilities and raiding. Today tents are more widely spaced during the winter months, just as the permanent dwellings of the Bm Bataw are located on their agricultural lands, which are individually owned. These dwellings are not clustered into villages. Each local community is composed of 50 to 100 “tents” (khayma-s), also frequently called “households” (dar-s).

The next level is the section, which is composed usually of three or four local communities. The Bni Bataw use a number of terms to designate sections, one of which is thigh (fakhda), a term also used by the Al Murra (fakhd is the exact term used in the Saudi dialect of Arabic). The Bnl Bataw presently are divided into five such sections.

To understand how tribesmen themselves comprehend their society, the first important thing to notice is that they do not consistently emphasize their relations with each other through patrilineal descent, although this notion is associated with the metaphors Of social organization provided by the imagery of blood and the parts of a tree. As one tribesman put it, “We are like the branches of a tree, but each branch is on its own,” emphasizing the fact that the claim of common descent does not necessarily determine the lines of faction and political alliance. Actually, in explaining how the metaphors of the parts of trees and the human body relate to their social structure, tribesmen rely heavily on the concept of “closeness” (qaraba). Qaraba does not necessarily imply real or assumed kinship, even for tribesmen. Closeness flows along a number of lines besides “blood.” It can develop through cooperation with nearby households, mutual herding arrangements, kinship and patronage relations, and other bonds of mutual interest. The notion of “closeness” is an important one and is discussed at length in the following two chapters. On a practical level, moreover, the enumerations of groups and their divisions at any moment never exactly tally. Although all tribesmen conceive of the relations between individuals and groups within the same framework (that is, the metaphor of the tree or of blood), there are regular variations in how these organizing concepts are applied to actual groups.

These variations are particularly clear at the “level” of the rural local community, the most important “level” in terms of everyday activities. Every tent belongs to such a local community. They are not set apart from each other by formal boundaries, only by the tribesmen’s shifting understandings of the identity of groups and their composition.

Tribesmen in a rural local community (and most of their wives) claim patrilateral relation to each other (among other ties), but no one can specifically demonstrate how all members of a group are mutually related. When pressed to indicate exact ties, tribesmen generally say that only “older” persons know or that such ties derive from “early” (bakri) times, an unspecified ahistorical past which is used to legitimize present-day social alignments,[109] Tribesmen do not ask each other for exact demonstrations of such ties. What counts is who acts together in a sustained way on various ritual and political occasions. This flexibility is seen in the council (jma[Q] a) which each local community has. This is not a formal body but is constituted simply by adult male heads of tents who informally consult on such issues of mutual concern as transhumant movements, quarrels over water and pasture rights, the hiring and payment of a Quranic teacher to reside with them and teach their children the rudiments of the Quran, maintenance of the whitewashed building which serves as a.tomb for their marabout, or saint (every local community is identified with one), and similar collective obligations.

Individual tents and groups of tents dissatisfied with belonging to a particular rural local community may seek to break away to join another rural local community or to form their own whenever circumstances permit. Marriage ties, land inherited by a wife, or even the purchase of land from an individual from another rural local community can serve as the basis for such a realignment. Such realignments frequently entail no physical relocation of households since for practical purposes only nearby rural local communities are ordinarily involved. Because of these shifts of identity, “official” administrative designations of rural

local communities are almost always inaccurate and are considered by tribesmen as a separate category of identity used only in formal contact with local officials.

Since rural local communities are constantly re-forming, one way of determining links is to see the camping arrangements at the annual festival (musim) of the major marabout of the region, Sfdi Mhammad Sharqi. His shrine and living descendants are located in the nearby town of Boujad'.This festival occurs each fall, just before the move to winter pastures. Groups are distinguished both by the placement of tents on these occasions and by the competitive displays of horsemanship and shooting (tahrik-s), sometimes called powder-plays (la^cb al-barud), in which they engage. The idea of these competitions is for groups to ride in a gallop in a straight line and to fire their guns simultaneously. Heavy betting accompanies these occasions. Participation in these competitions reflects new social alignments, and some realignments are due to disputes over the competitions themselves. Since the marabout's festival is also the one time in the year that tribesmen gather from a large area, such powder-plays in effect constitute public announcements of new social arrangements. As the conception of patrilineal descent is a relative one which changes with actual social arrangements, the groups involved legitimize their new relations to each other by shifting the way in which they represent their ancestors and links with particular marabouts.

The identity of sections among the Bni Bataw is somewhat more stable over time, although these also shift in composition and identity. One reason for their greater stability is their administrative reality. The precolonial, colonial, and independent governments have invested the rights to collective pastures in sections and still allocate many taxes through the administrative apparatus associated with

FIGURE 5-3 Competitive riding at a musim, Morocco, 1968. (Courtesy of Maurice Grosser.)

sections. Prior to the colonial period, sections also performed significant functions. Each section, for instance, constructed fortified compounds made of mud and stone which were used for collective defense in times of intertribal raiding. Sections also made collective arrangements for grazing rights to pastures controlled by neighboring groups, but there were many other "levels" at which such arrangements could also be made. Individuals from different tribal groups, for instance, could make arrangements among themselves, if they had confidence in each other.

More formal arrangements between relatively stable groups also were common. A common sort were "ritual alliances" (tata) made between rural local communities and sections of the same and different tribes. In such alliances, groups agreed to refrain from fighting and raiding each other and, at least in principle, to aid each other in the event of threats from third parties. Such alliances generally involved the exchange of herding rights

as well. The patterns of such alliances occasionally coincided with “closeness” as reckoned by the formal ideology of patrilineal descent, but such ideology was by no means the primary factor in their formation.

Such ties worked in the following manner. For instance, the Flalha (see Fig. 5-2) local community of the Bni ^cIsa section of the Bnl Bataw concluded an alliance with the ^cAbabsa section of the tribe—the fact that the two groups were considered to be at different “levels” of organization was not considered significant by the Brn Bataw themselves. They met at the shrine of one of the marabouts in Boujad and swore an alliance.

Each collectivity had multiple alliances of this sort. The Wlad Khallu section had three such alliances with other sections just before the colonial era. One section was part of an Arabic-speaking tribe with adjacent agricultural lands; another involved an Arabic-speaking tribe at some distance from their own; a third alliance was with a Berber-speaking neighboring group, the Alt Bu Haddu.

These alliances were concluded by different ritual means. In one case the groups involved had a communal meal, at the end of which all the men present removed one of their slippers and placed them in a pile, one pile for each of the two groups. Slippers from the two piles were then matched at random. The men whose slippers were paired became companions with a special relation to each other. Whenever one needed permission for pasture rights or other matters, he approached his companion in the other group. In another case, the lactating women of the two contracting groups nursed the children of the opposite group after the mtn’s communal meal, thus creating bonds. In the third case, the councils of the two groups had a communal meal in which the milk from lactating women of the two groups had been mixed in one of the plates, thus creating an enduring tie of milk brotherhood. Once such an alliance was concluded, any violation was considered to invite supernatural (as well as human) retribution.

I have said little of the level of the “tribe” so far, for the simple reason that from the historically known precolonial period, it appears to have existed more as a set of vague “tribal” names which provided a range of potential identities for various groups at different times than as a base for sustained collective action, although coalitions of various sections and rural local communities within the “tribes” frequently occurred. When these coalitions did occur they did not come together along strict lines of closeness of lineal descent. This is demonstrated by the patterns of resistance in which persons from various “sections” and “tribes” associated themselves against the French. Precolonial accounts of disputes in western Morocco also suggest that alliances followed much more flexible lines.

The imposition of colonial government in 1912 had a number of important consequences for tribal organization, especially when the colonial regime had become firmly implanted by the

1920s and 1930s. For one thing, the average size of herds was reduced from what it had been in the precolonial era. Part of the reason was that many townsmen had made substantial investments in livestock, making arrangements with the individual tribesmen in most cases. As alternative investments opened up and became more lucrative, such local investments declined. In addition, the colonial government imposed restrictions upon pastoral movements, reducing the flexibility which was possible in the precolonial era.

An interesting aspect of the French colonial understanding of tribal structure is that it depended more upon the ideology of agnatic relationships than did the Moroccan tribesmen themselves. Segmentary ideology was administratively convenient as an “official” representation of local social structure. How were these administrative understandings translated into practice? Each winter, as I indicated earlier, the BnT Bataw moved with their herds to the Berber highlands. Yet, for the French, the Berber highlands were under military rule while the lowland plains were under the civil native affairs administration. In the precolonial period, pasture rights could be arranged even between individuals or several tents of different tribal groups when peaceful conditions prevailed. In some circumstances, the host person or group charged a price for such rights; in other cases, only reciprocity at a later date was expected. Of course, disputes occurred frequently, but these only served to emphasize the wide range which such pastoral arrangements could take. The French found this flexibility confusing for administrative purposes, especially when tribesmen crossed administrative boundaries.

Colonial archives for the 1930s indicate that some administrators went so far as to propose a ban on pastoral movements which crossed administrative boundaries, unaware that such radical restrictions would have the consequence of drastically reducing the size of herds and making the survival of the BnT Bataw precarious. In the end, a compromise was adopted in which movements of herds were authorized but only on a reduced scale and only involving entire sections. The French argued (in line with popular sociological assumptions of the period) that only collective arrangements were “traditional.”

French administrative divisions, however, worked more along the lines of a quasi-genealogical framework than Moroccan tribes. For example, let us say that a pastoral dispute broke out between the Brii Bataw and a group of Berber tribesmen while the Bni Bataw were with their herds in the Middle Atlas mountains. The French civil official in the town of Boujad who was responsible for the Brii Bataw was not allowed to communicate directly with his military counterpart twenty miles away who was responsible for the neighboring Berber group. Instead, he was obliged to communicate with his immediate superior in a neighboring town, who in turn communicated with his civilian superior. This administrator, in turn, contacted the ranking military officer responsible for the Middle Atlas region, who in turn communicated with his subordinates. These rigid administrative hierarchies simply had no counterpart in Moroccan tribal organization, although the genealogical grid used by the French to indicate relations among various groups naturally had important consequences since pasture rights and taxes were determined by them, and local strong men had their privileges reinforced by the support they received from the French by appointment as unsalaried officials.

Now what is important about these complex patterns of association and identity? To say that some rural Moroccans are “tribesmen” tells us very little now or in the past about how they conceive of their social identity and comport themselves politically in relation to other groups. Lines of political cleavage follow no preordained pattern but depend upon complex factors of residence, kinship, herding, and land arrangements, among other considerations. Those interests that are most significant often are legitimized by being thought of in the idiom of genealogical grids determined by concepts of patrilineal descent. “Tribal” man, at least in the context just considered, does not respond in a semiautomatic way to the affairs of the various social collectivities to which he belongs. The notion of “closeness” outlined earlier is a more comprehensive one which allows for considerable variation in the forms which social action can take in Morocco.

Of course, the social organization of a Moroccan tribe cannot in itself be taken as “representative” of all Middle Eastern tribes, as I indicated earlier. But the type of analysis which I have sketched can serve as a guide to understanding tribes in other contexts. Such analysis involves an account of how persons in a given society explicitly and implicitly conceive of the social order and proceed to act on these assumptions. It also involves seeing how these assumptions are modified by and in different historical contexts. Although Middle Eastern countries and'regions within them share numerous economic, social, and cultural similarities, they differ in just as many ways. Comparisons of “tribal” societies in these countries based solely upon a single point of resemblance, such as the ways in which ideologies of patrilineal descent are used and manipulated, can be highly misleading because such ideologies in themselves are simply Inadequate to describe the political organization of Middle Eastern tribal groups.[110]

*** Segmentation Ideology or Segmentary Theory: The Bedouin of Cyrenaica

One reason for the fascination with segmentary lineage theory as it has been applied to tribal peoples in the Middle East, Black Africa, and elsewhere is the extent to which it assumes that the explicit native ideology of the social order (usually one based on patrilineal descent) and the anthropologist’s analytical model of that order were thought to coincide. As I have already indicated, segmentary lineage theory does not account for many crucial features of tribal social and political organization and for this reason is a mistaken way of explaining the working of tribal societies in the Middle East. Yet such theory has played an important role in the social anthropology of the Middle East and elsewhere. When ethnographic accounts developing its assumptions began to be published in the 1940s and 1950s, segmentary lineage theory appeared to provide a framework within which anthropologists could undertake meaningful comparative research.[12]

Figure 5-4 shows the essentials of the idea of segmentation. I am using letters rather than the names of actual groups and numbers to refer to various “levels” of segmentary society so that its abstract features are more discernible. There are three assumptions necessary for

segmentary theory to be valid: (1) A society must conceive of its political relationships primarily or exclusively according to a tree of lineal descent (either patrilineal or matrilineal); (2) groups at each “level” of society must be balanced by another group of roughly equal strength; and (3) individuals within such a society must be considered equals.

Political obligations and relationships in such a society become particularly

FIGURE 5-4 The concept of segmentation. (After Dale F. Eickelman, Moroccan Islam, p. 207. Courtesy of the author and the publisher.)

[12] See, for instance, M. G. Smith’s early review of the use of the concept in ‘‘Segmentary Lineage Systems," Journal of the Royal Anthropological Institute, 86 (1956), 78.

on evident in the case of a feud resulting in homicide. Suppose, for instance, that a dispute occurs between a person from group A and another from group E at level 1. Both disputants presume that they can rely for support upon their fellow group members. If such a dispute involves a person of group A and another of group F, a higher level of escalation occurs. In this case, groups A and E are expected to support the person from group A; groups C and F are expected to support the person from group F. Thus, groups coalesce at level 2. In a dispute involving groups A and H, groups E, C, and F are expected to rally to the support of group A, while B, G, and D are expected to rally to the support of H. Such a conflict involves opposing groups at the more inclusive level 3. Finally, a challenge to the tribe from outside involves the participation of all groups claiming descent from a common ancestor-the tribe as a whole (level 4), This schema of relationships can be expanded, indefinitely, although in practice more than four levels are rarely involved. Real names for groups and their levels can, of course, be substituted, such as tent, lineage, clan, and tribe among the Al Murra of Saudi Arabia and tent, rural local community, section, and tribe among the Bnl Bataw.

The various “higher” levels of segmentation are called contingent social forms by anthropologists because they come into being only when a group or individual is threatened. The groups themselves are acephalous, or leaderless, since in principle all members of segmentary societies are considered to be equals, although temporary leaders may emerge at times. Such a society of equals results in what Evans- Pritchard has referred to as “ordered anarchy.”[13]

I have already indicated the fascination that this concept of the social order held for anthropologists. It raised a basic question of European social philosophy- how was it possible for individuals to cooperate in society? The seventeenthcentury English philosopher Thomas Hobbes had posed the question in the following manner: How could the various wills, passions, and desires of individuals be coordinated so that there would not be a war of all

against all? Given his particular image of man and society, his answer was that while all men sought to satisfy their desires to the full, no one could do so in a state of total anarchy. Hence, men possessed a “spark of reason” which enabled them to agree to at least a minimal “sovereign” control over themselves in order to pursue their self-interest. In segmentary societies, the minimum of such control is certainly reached as no permanent “governmental” authority exists, only the contingent social forms of cooperating individuals organized in groups determined by the metaphor of blood relations. The principle of segmentation thus provides the minimal conditions for a society to exist, in which violence and self-help provide the ultimate sanctions. Segmentation theory had the added attraction of providing a key notion by which a wide range of social forms in certain types of societies could be explained.

Interest in the concept of segmentation, although not labeled exactly as such, is evident in such influential sociological Studies as The Division of Labor in Society (1893), where Durkheim writes of “mechanical” or “segmental” societies in which

^TheNuer (Oxford: Clarendon Press, 1940), p. 6.

individuals and groups tend to resemble each other to the point that he compares their forms to the rings of an earthworm.[111] Even if cut up, each part is capable of existing on its own. One of his primary examples of such a society was the Kabyle of Algeria,[112] although anthropologists later developed the notion of segmentation in Black Africa as opposed to the regions north of the Sahara.

The most thorough ethnographic application of segmentary lineage theory occurred in the context of Evans-Pritchard’s books on the Nuer, the first of which appeared in 1940. As indicated in Chapter 2, it appears likely that Robertson Smith’s analysis of Arab kinship had a profound influence on Evans-Pritchard. In conversation he has even indicated that the full potential of segmentary lineage theory first occurred to him after a series of visits he made to the Bedouin of Egypt’s western desert in the 1930s.[113]

There is no question that segmentary ideologies provide a “native model of tribal society, but the question remains regarding the extent to which it. is an accurate analytical model of the social order of societies so characterized. If the major work of developing the concept of segmentation occurred in the context '

of Black Africa, the realization of its limitations became most readily apparent in <

later work in Middle Eastern and other contexts.

Discussions of segmentary ideology in the Middle Eastern context are numer- j ous. The concept is often used in very misleading ways, so that one scholar discussing Iran has written that the notion “somewhat” describes the political comportment of the Iranian elite over long periods of time and another applies the notion loosely to account for political factions among the Moroccan elite, when all that is meant is that political rulers have sought to “divide and rule” in order to maintain their own hegemony. Here I am concerned with the more accurate use of the concept in a tribal setting, and specifically with an important 1967 article by Emrys Peters on the Bedouin of Cyrenaica, which contains a comprehensive critique of segmentation theory.[114]

Peters’s account is based upon fieldwork carried out between 1948 and 1950, during which time the tribal groups involved still were camel-herding pastoralists. In the first part of the article, Peters explains the social organization of the Bedouin as they themselves see it. Thus, the basic unit of social organization is the camp— that is, groups that herd together. Over 80 percent of the males in these camps, each of which has a population of 200-700, are agnatically related. Acceptance of a common name in such a group implies full political responsibility. Such “tertiary” groups (as they are designated by Peters) are corporate for most purposes. Moreover, each camp has its own wells, ploughland (these groups also cultivate), and pasture. In Fig. 5-4 such groups are represented as level 1, where the irregularly drawn spheres associated with them are meant to indicate the territory possessed by each descent group. The ultimate test of membership in such a tertiary group is conduct during feuds and the payment of blood money. If someone does not participate aS expected in such matters, he risks splitting from the group. Bedouin say that homicide within a tertiary group is unthinkable since the group is supposed to respond to the injury of any of its number as “one body.” Such homicides occur nonetheless, but Peters points out that the Bedouin do not think of them in terms of murders requiring revenge. The most common result is the voluntary exile of a slayer or his expulsion from the group.

As for homicide between tertiary sections, such as A and E on Fig. 54, the payment of blood money or a vengeance slaying is the most probable result. Peters indicates that such collateral tertiary groups are usually neighbors. Although each has a different tract of territory and different wells, social relations between them are fairly intense. A prolonged feud would seriously disrupt such relations, so neighboring groups usually find it expedient to find some way to remain on friendly terms rather than engage in long-term feuds. In most cases, settlement is arranged through an agreement to pay “blood money” (diya). The amount agreed to is rarely paid in full, for, as Peters says, debt, like the feud itself, is a form of social relationship (although the feud is a negative one). As long as the debt is not fully paid, the social relationship endures.

At the next level of segmentary integration (level 2 on Fig. 5-4 and “secondary sections” in Peters’s article), homicide characteristically results in a feud. Most such sections occupy different ecological regions. If a feud develops between them, there is no urgent necessity to make peace, unlike the case for neighboring groups on level 1 of the figure. However, feuds

which occur between groups at the level of what Peters calls secondary sections also have their etiquette. For instance, feuds were not carried on at the market, although in the case of hostilities, rival groups usually arranged to be present at tribal markets at different times. [115]

At level 3 of Fig. 5-4 (“primary” sections for Peters), men of collateral sections often are complete strangers to each other and meet only irregularly. When a homicide occurs, it is unlikely that negotiations will even be undertaken. In this case, reciprocal raiding occurs, often for prolonged periods, but large-scale killing is avoided. Challenges from outside the tribe itself involve the entire tribe, but such hostilities result in wars instead of feuds in which (at least in the nineteenth century) major losses of life occurred. In wars, unlike feuds, there were no conventional restraints upon attacks, at least in principle.

Peters’s article elaborates in considerable detail how the Bedouin themselves make use of segmentary ideology to explain their social relationships. In this he makes a valuable contribution, for many accounts of segmentary ideology are highly schematic and present virtually no specific examples of how this ideology is applied by its adherents to specific, historically known situations.[116]

There are a number of ways in which segmentary ideology fails as an analytical model of social action. As Peters indicates, if all secondary sections were engaged in feuding, for instance, pastoral movements would become impossible. Such contradictions present no direct challenge to segmentary ideology for the Bedouin; a number of contingencies are invoked to explain why segmentary ideology does not apply directly to particular situations. Unfortunately, segmentary lineage theorists have similarly tended to invoke contingencies rather than question its viability as a sociological model.

Peters goes into the weakness of segmentary lineage theory in some detail to document his contention that the lineage model is not a sociological one. He sees such theory as possessing four major weaknesses. First, segmentary groups simply do not occur in a balanced opposition to each other. What Peters calls tertiary groups (rural local communities in the context of my Moroccan example) are not balanced against each other. Resources of land and herds are unevenly distributed, as is the population of various groups. There is a great variation in the number of groups which occur at this level of differentiation.

Secondly, when groups combine, they do not do so in terms of the combinations anticipated through an application of segmentary lineage theory. Similarly, segmentary lineage theory assumes that power is distributed equally throughout the entire tribal political system and doesnot acknowledge the existence of leaders. As Peters indicates, such leaders exist, although lineage theory has effectively blocked the analysis of patterns of tribal leadership. Moreover, such leadership does not occur along the lines of groups as determined by segmentation theory.

Third, there is considerable disparity in the political resources enjoyed by various groups, as opposed to the rough equality of people and resources presumed by segmentary lineage theory. Groups may appear “equal” as descendants of a pair of brothers from a common father, but such equality in a genealogical sense masks a considerable disparity of political strength and of the actions that a group is willing to take. This point applies equally to the Al Murra, the example discussed at length in the last chapter.

The fourth objection to segmentary lineage theory is that it says little about ties of kinship created through women. By Bedouin ideology, women and the ties created through them belong to the nonpolitical realm of domestic relations. Yet there are important political and economic links created through marriage ties and other ties through women.[117] The Bedouin (and anthropologists working within segmentation theory) seek to account for such ties through “secondary” rules that do not involve the principles of segmentation. Yet there are important areas of conduct that cannot be explained by such assumptions. As Peters indicates, killing a relative through marriage is as repugnant to the Bedouin of Cyrenaica as killing a close agnate, and there are numerous marriages that occur between neighboring groups. In many circumstances, one’s mother’s brother may be the only person to whom one can turn to in situations such as access to water rights in years of drought. Similarly, in the payment of blood money, it is not unusual for a mother’s brother to contribute even when there is no obligation to do so in terms of segmentation theory.

The Bedouin also have an explanation for such contradictions in terms of segmentation theory. They claim that they marry whenever possible within their own group so as to avoid conflicts of interest between opposing segmentary groups.[118] As Peters indicates, this is simply not the case. By studying the total marriage patterns of Bedouin groups, a different pattern emerges. Bedouin create a significant number of strategic alliances with other groups through highly selective political marriages which taken together give groups access to a range of ecological resources and other aid. Such ties are of more than secondary importance. As Peters writes, throughout his stay in Cyrenaica he never saw groups assembling along the lines expected by segmentary lineage theory. When disputes occurred over wells or ploughlands, agnatically close groups were often absent while genealogically more “distant” groups often were present. A number of men who took sides in such disputes were not even kinsmen but were related in other nonkin ways to the main protagonists in such disputes.

These are some of the principal objections to segmentary lineage theory. As an ideology of social relations among many tribal groups in the Middle East, the notion of segmentation has considerable importance. As a sociological model, it is inadequate. I have dealt with it at length only because it has mistakenly led many anthropologists to explain virtually every problem in tribal social relationships in terms of the lineage system.

The issue of whether segmentary lineage theory can usefully explain the workings of tribal society has been important only because such theory has been used uncritically to account for common social elements in the entire region. It also has blocked the development of alternative and more satisfactory ways of accounting for social structure. Some anthropologists have gone so far as to construct elaborate theories accounting for how presumably acephalous and egalitarian tribes in the' Middle East coexisted with the inegalitarian social order of the cities and states of the region, at least in the “traditional” past. Unfortunately no clear evidence exists to support such an assumption.[119] Thus Ernest Gellner, one of the main defenders of this point of view, has presumed that the High Atlas region of Morocco on which he based his account of tribal society had “traditional [segmentary] institutions” which until the 1930s “had survived untouched ... in a kind of sociological ice-box” until his own work in the region in the mid-1950s.[120] Yet significantly, Gellner can provide no specific examples of political action by High Atlas Berbers for the pre-1930s period, and the evidence that he provides for later periods is irrelevant or contradictory to his contention that segmentary theory is valid.[121]

It is possible to make general 'statements concerning common elements of religious belief, political organization, economic activity , and other fields of activity in the Middle East, but such statements should take the form more of “family resemblances,” partial similarities that can meaningfully be compared and contrasted, rather than exact identities asserted by simpler,but less accurate theoretical i assumptions. This is emphatically the case with Middle Eastern tribes and with the] subject of Chapter 6, ideas of kinship and family in the Middle East.

** 6. Personal and Family Relationships

*** Kinship Today

Anthropologists today recognize that kinship and family relationships, and cultural ideas concerning them, must be studied in the context of complementary, locally held notions such as patronage, neighborliness, and friendship. This assumption has not always guided ethnographic inquiry and analysis in the past. For instance, a major body of anthropological theory once held that kinship in all societies was concerned with what were essentially biogenetic relationships which could hence be compared cross-culturally. Kinship in such a theoretical perspective is then defined primarily in terms of genealogical criteria instead of other possible bases of interpersonal relationships.

As I see it, there are several rather straightforward arguments that should be made in understanding kinship and family relationships cross-culturally. First, whatever the actual

groupings are of people who feel obliged to one another through “family” relationships, these groupings act in cultural terms which have a biogenetic reference. Nonetheless, how people behave toward one another as “kin”: and “family” cannot be accounted for entirely in terms of norms of obligation defined in biogenetic terms. Hence anthropologists must elicit what are the shared cultural notions of family and relationship prevalent in any given society rather than presume their coptent (for example, shared biogenetic substance) in advance. [1]

[1] Among recent studies which take such an approach are David M. Schneider, American Kinship: A Cultural Account, Anthropology of Modern Societies Series (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1968) and his more recent “What Is Kinship AU About?” in Kinship

-inn

Second, in the past, many American and European anthropologists have implicitly and inappropriately imported their own cultural stress on biogenetic “natural” ties when interviewing people in the Middle East and in analyzing their notions of kinship and family. The result has been to overstress genealogical kin- drip ideologies, which have their main and clearest form for Muslims in the Quranic inheritance code and for all Middle Easterners in the kinship terminological system? Because there are some similarities between the Arabic formulations and American notions, some anthropologists have wittingly or unwittingly extrapolated their own cultural notions much too far into the Middle Eastern data. This has been particularly the case in limiting family ties to blood ties and in assuming that the notions of “clan” and “tribe” have overriding significance in the ordering of behavior and in the determining of choices in moral situations? Such misleading assumptions have in part contributed to the popularity of notions such as segmentary lineage theory, as discussed in Chapter 5. Two related issues are involved here. One concerns how coercive are kinship norms in themselves. The other concerns the independence of kinship norms from other kinds of social obligations.

Studies in the Morgan Centennial Year, ed. Priscilla Reining (Washington, D.C.: Anthropological Society of Washington, 1972), pp. 32-63. See also Rodney Needham, “Polythetic Classification: Convergence and Consequences,” Man (N.S.), 10, no. 3 (September 1975), 349-69;and Hildred Geertz and Clifford Geertz, Kinship in Bali (Chicago and London: University of Chicago Press, 1975).

[2] The form which kinship terminology takes throughout the Middle East is remarkably consistent and can be indicated briefly. The principal kinship; terms for family of origin in

formal Arabic are as follows: father (ab), mother (umm), father’s brother {^camm), father’s sister pamrna), mother’s brother (khil), mother’s sister (khSla), brother (akhj, sister (ukhtj, son (ibn), and daughter (bint}. The principal terms indicating affinal links, or ties through marriage, include husband (zawj), wife (zawja), and father-in-law (nastb}; ansibfi', the plural of naitb, designates in-laws in general. There are a few other terms, such as grandson and granddaughter (hafid and hafTda), and grandfather and grandmother ((add and jadda). The plural of these terms, ajdad, is used to designate one’s ancestors in general. Terminology such as the above is called denotative by anthropologists, because its emphasis is upon specific relatives rather than classes of them. Relatives other than those specified above are generally designated by combinations of these terms. For instance, a father’s brother’s son is ibn ^camm, and a wife’s father is abu zawja. There are other combinations of terms to designate half-siblings, co-wives, and other types of relationships. The exact terminology in colloquial usage varies throughout the Middle East but tends to follow the general pattern described above. For Morocco, see Hildred Geertz, “The Meanings of Family Ties,” in Meaning and Order in Moroccan Society, Clifford Geertz, Hildred Geertz, and Lawrence Rosen, Cambridge Studies in Cultural Systems (New York: Cambridge University Press, 1979), pp. 356-63; for Egypt, see Hani Fakhouri,Kafr el-Elow: An Egyptian Village in Transition, Case Studies in Cultural Anthropology (New York: Holt, Rinehart and Winston, Inc., 1972), pp. 57-61; for South Yemen see R. B. Serjeant, “Kinship Terms in Wadi Hadramaut,” Der Orient in der Forschung (Wiesbaden: Franz Steiner, 1967), pp. 626-733. Kinship terminology in Turkish and Persian, the two other major languages of the region, follows a similar pattern. See Paul Stirling, Turkish Village, The Nature of Human Society (New York: John Wiley &. Sons, Inc., 1965), pp. 151-55; Fredrik Barth,Nomads of South Persia (New York: Humanities Press, 1965), p. 31.

[3] For an elaboration of this argument in an Algerian context, see Pierre Bourdieu, Outline of a Theory of Practice, trans. Richard Nice, Cambridge Studies in Social Anthropology 16 (New York: Cambridge University Press, 1977), pp. 30-71; for a Moroccan example which jndi-

Third, the anthropologist or any other person 'interested in understanding . Middle Eastern life should try to follow “native” constructs and logic as thoroughly as possible. Knowledge of the full context in which ideas of family and personal relationships are held is perhaps especially important for an understanding of Middle Eastern societies because kinship forms and the personalization of social relationships permeates even bureaucratic and industrial settings, perhaps in an effort to make such relationships more reliable. It is not unusual to find the key offices of governments of the region constituted in large part by close relations, presumably because kinship ties in some contexts are assumed to be a guarantee of loyalty. This is the case not only in the monarchies of the region, such as Saudi Arabia, Oman, and Morocco, but in other regimes as contrasting as Ayatullah Khomeini’s (and the significant

roles of his son and son-in-law) If an, Syad Barre’s Somali Democratic Republic, and Anwar el-Sadat’s Egypt. Nor are such actions always regarded as an abuse of political authority.

The study of notions of kinship in the Middle East, like the study of tribes, has been a task often regarded as a distinctly anthropological preserve, although this has not prevented scholars in other fields from making generalizations about the nature of family and group identity without adequate empirical investigation or confirmation. Indeed, such assumptions can intentionally or unintentionally become highly politicized. For instance, Edward Said has taken a distinguished sociologist to task for writing that “co-operation in the Near East is still largely a family affair and little of it is found outside the blood group [sic] or village,” on the grounds that it suggests a diminished capacity of Middle Easterners to organize “institutionally, politically [and] culturally.”[122] [123] Yet because a large number of personal relationships are cast in the language of family relationships, and such ties pervade government offices, the secret police of some countries, and other key organizations, understanding the elastic uses to which the term family is put is especially important in the case of Middle Eastern societies.

As with conceptions of “tribe” in the Middle East, there are no single notions of kinship and family which hold from one end of the region to the other, nor can variations between the kinship systems of the region be used to classify them taxonomically. Cultural notions of personal and kin relationships vary considerably from Rabat to Kabul, from rural to urban settings, and among different educational and socioeconomic categories of society.

*** Cultural Forms

The best way of recognizing why our own notion of kinship should be used comparatively only as a first-order approximation is to look at concepts drawn from different parts of the Middle East which could be glossed as “kin”: These are the notion of qawm (Afghanistan), hamula (Arabs in Israel), and qaraba (Morocco). In Afghanistan, qawm refers to a socially united and territorially contiguous group of people who speak of themselves as if they are also linked by agnatic kinship, although such a group actually includes affines, some neighbors, and others. Significantly, the term does not apply to persons or households who fail effectively to cooperate with other members of the qawm, in spite of close agnatic or affinal ties. A qawm is ideally “a territorially and socially integrated group, joined together through ties of kinship, political action, and religious belief and ritual.”[124] Although qawm can also refer to persons sharing common agnatic descent, it would be incorrect to regard such a usage as primary and its reference to “a territorially and socially integrated group” as secondary. The central feature of the Afghani concept of qawm is the active maintenance by its members of a shared notion of relationship. It is this ideological form which is. primary, not a “native” recognition of “blood” ties, even if such assumptions are metaphorically important.

The same general point holds for some of the shared notions of identity among Arab villagers in Israel. In a study conducted in 1958-1959, Abner Cohen found that most (but significantly not all) households were identified with a number of patronymic associations called hamula-s. The shared identity of the hamula was expressed in the idiom of patriliny, although villagers themselves were aware that not all the claimed patrilineal links were historically valid.[125] To emphasize the fact that he was not writing of lineal descent, Cohen used the term patronymic group in his book to stress that the shared element othamula identity was the name of a claimed agnatic ancestor. To my knowledge Cohen was the first ethnographer to break with the more conventional assumptions of lineage theory in a Middle Eastern context. In a later publication he referred to the hamula by the more appropriate term of patronymic association rather than group in order to emphasize better the flexibility inherent in the cultural principle of hamula and its frequent lack of sharp principles of exclusion in social practice.[126]

For certain specific purposes such as inheritance, a calculation of agnatic relations and affines was made in principle in terms of the tenets of the Quran. However, everyday domestic arrangements and the political alignments of the hamula were governed by principles of social identity that were not based soley upon ties created through “blood” and marriage, as Cohen’s case studies meticulously demonstrate. In practice, hamula identity was based upon a complex web of patrilineal, affinal, and matrilateral ties, neighborliness (most hamula households were located in the same section of the village), and sustained cooperation in political, economic, and ceremonial activities. As political alignments and interests altered, some households even shifted their hamula identity, although such realignments generally occurred only among households not clearly identified with the hamula’s core. Nonetheless, when asked to define a hamula, villagers did so in terms of common descent, although they privately stated to the ethnographer that such claims could not always be demonstrated. As with other forms of social identity, hamula affiliation in itself did not determine the lines of cooperation and political action, despite the fact of such identity being couched in the idiom of patrilineal descent. Cohen provides numerous examples of cross-hamula ties of friendship, patronage, and common economic and political interests which served equally as bases for unity and cooperation. Ties created through marriage were similarly used. Cohen points out that intra-Aamu/a marriages were relatively common, but that marriages outside the hamula could equally serve as the base for close economic and political cooperation.[127]

A third example, from the “far West” of the Middle East, is the Moroccan concept of “closeness” (qaraba), briefly introduced in its rural/tribal context in Chapter 5.[128] As used by urban and rural Moroccans, “closeness” carries contextual meanings which range imperceptibly from asserted and recognized ties of kinship to participation in factional alliances, ties of patronage and clientship, and common bonds developed through neighborliness. Closeness is constituted by compelling ties of obligations. Often closeness is expressed as a “blood” tie, even when no demonstrable linear ties exist, because however such ties are valued in practice, they are considered permanent and cannot be broken. Yet in

contexts other than those governed by inheritance law, closeness based upon family ties is generally not sharply differentiated from closeness based upon other grounds. Most frequently, persons seek to make the various bases for closeness overlap.

There is evidence, that the concept of closeness as used in present-day Morocco is not an accommodation to recent developments. In many respects it resembles the concept of “group feeling” (^casabtya) explained centuries earlier by the North African philosopher Ibn Khaldun (d. 1406). Ibn Khaldun indicates the multiple bases upon which group feeling can be asserted among both townsmen and tribesmen but ultimately opts for the ideological position that the “naturalness” of “blood” ties makes them superior to all other modalities as a basis for group feeling.[129] Nonetheless he makes it clear that the underlying cultural construct of ^casabTya is not based exclusively or primarily upon socially recognized notions of lineal descent.

*** Practical Kinship: Morocco

The significance of the shift from talking about kinship to exploring notions such as qawm in Afghanistan, hamula among Arabs in Israel, and qaraba among Moroccans can be stated as follows: Kinship can be,considered an experience-distant concept. It is one formulated for the purposes of the analytically inclined participant to comprehend a phenomenon or to compare it with others, either typologically or through “family resemblances.” On the other hand, experience-near concepts are those which individuals use “naturally and effortlessly” to define what they see, feel, think, and imagine and which they “readily understand when similarly applied by others.”[130] “Closeness” is such a concept in Morocco.

An illustration of how the notion serves as a guide to practical social relationships is provided by the prominent maraboutic (or “saintly”) patronymic association in the Moroccan town of Boujad, which had a population of approximately twenty thousand persons in 1973. The town is a local pilgrimage center located on Morocco’s western plains, next to the foothills of the Middle Atlas mountains. Roughly a third of Boujad’s population claim descent from the marabout Sidi Mhammad Sharql (d. 1601). Collectively these descendants are known as the Sharqawa-Shaiqaw being the plural for Sharqi in Arabic. The town has twenty-six maraboutic shrines of varying importance; twenty-three of which are Sharqawi shrines. Despite the decline in recent years of popular belief in the efficacy of marabouts as intercessors with the supernatural, the town remains an important regional pilgrimage center and is also' the administrative and market center for its rural hinterland.

Because of the advantages of wealth, prestige, and education which derived from the reputation as marabouts of some Sharqawa in the past, many have managed to maintain prominence in Morocco today as merchants, entrepreneurs, officials, and politicians.

Although today SharqawT prominence is justified principally on other grounds than maraboutic descent, some Sharqawa still derive considerable material and status benefits from the gifts they receive from their largebj rural clientele.

What exactly does the claim to SharqawT descent mean in Boujad today? The Sharqawa do not act collectively as a group and never did so consistently in the, past. Descent was only one of a number of identities which they shared. In Boujad, itself, there are currently eight SharqawT patronymic associations. All of these claim , descent from sons of SIdi Mhammad SharqT, although none are able to trace their , exact genealogical links with him. Nonetheless, this information is said to repose in books and records. Of the eight SharqawT patronymic associations represented in Boujad, the members of two of them additionally claim descent from prominent nineteenth-century Sharqawi marabouts. Each of these patronymic associations is associated with a residential quarter in Boujad. In addition, there are persons who claim SharqawT descent elsewhere in Morocco.

One of the two most prominent SharqawT patronymic associations in Boujad is that of the ^cArbawa. Identification with a patronymic association in itself does not imply an obligation to act in common with other individuals who belong to it, as recent experiences in local electoral politics and disputes over various local issues amply demonstrate. Still, ^cArbawT quarter is one of the most tightly knit in Boujad. Approximately 86 percent of its three hundred or so residents (as of 1970) were born in the town itself, as opposed to an average of 54 percent for the town as a whole. A majority of the households in this quarter claim bonds of kinship with each other. In fact, many of them have shared inheritance rights from agricultural estates and other holdings. More importantly, among the descendants of the leading SharqawT marabout of the nineteenth century, after whom this quarter is named, are prominent administrators, merchants, politicians, a brother-in-law of the King of Morocco, and even a leading sociologist. There are advantages of prestige in claiming identification with this particular patronymic association.

Ideally the households of a quarter are considered to be bound together by multiple personal ties and by common interests. In fact, a “traditional” residential quarter in Morocco can be defined as the extension of “closeness” (qaraba) in physical space. Component households should be able to assume a certain moral unity so that in some respects social space in their quarter can be regarded as an extension of thejr own households.

Ties of closeness in a patronymic association such as the ^cArbawa, especially when many of its component households live near each other, are elaborated and reaffirmed in "numerous ways: the exchange of visits, assistance and participation in the ritual activities associated with the births, circumcisions, weddings, and deaths of its members. For closeness to be said to exist in a patronymic association, as in a residential quarter and in a traditional urban setting such as Boujad—the two significantly overlap—the quarter must be capable of collective social action in at least some significant contexts, This usually

means that there are one or several men of standing (kubbar) with “word” or decisive influence in the patronymic association or quarter who are able to act as spokesmen for the comm'”’ [;] -[J]

FIGURE 6-1 Tetouan, Morocco. Neighbors In traditional quarters such as this often claim "closeness." (Courtesy of the author.)

critical occasions and to mobilize the heads of households of the collectivity. Ideally, the notions of patronymic association and residential quarter converge. When this overlapping occurs in practice, as in the case of the ^cArbawT patronymic association/residential quarter, then mobilization of the collectivity forms a regular part of the fabric of social life.

In many “traditional” spatial settings, neighbors who cooperate effectively with each other will seek to claim to outsiders that they have common descent as a means of enhancing their prestige. Thus the inhabitants of another residential quarter in Boujad, not far from ^cArbawi quarter, claim common origin from a nearby tribal group and assert kinship with one another. Although certain households of the quarter are related by ties of kinship and marriage, others are linked solely by occupation, neighborliness, and by other common attributes not related to the attribute of descent. Again, the one feature common to all the quarter’s households was their ability on occasions to act successfully as a collectivity.

The quarter in question, Qsayra (“The Little Fortress”), is so named because it adjoins a fortified, high-walled SharqawT quarter and, in fact, looks like a scaled- down version of it. How closeness is demonstrated by residents of the quarter will serve to indicate how notions of “family” and “kinship” must be understood in their Moroccan context. Most residents of the quarter claim that they or their ancestors came from Ait Salih, a tribal grouping to the immediate west of Boujad. Without denying their Ait Salih origin, others prefer to stress their,relations with one Hajj Bu Bakr, himself reputedly of Ait Salih, who founded the quarter at the turn of the century and whose household serves as the core with which other households claim affinity.

Bu Bakr was a tannery owner and grain merchant when the French arrived in 1913. Not long after this event, he made a fortune through his commercial activities. Soon he converted his fortune into social honor, first by making the pilgrimage to Mecca and thereby acquiring the title of Hajj (“Pilgrim”), then by constructing an imposing house for himself, and later by marrying a second wife. As his sons matured and married, he built adjacent houses for them, in the manner of other men of prestige. He also constructed a small mosque for the quarter

and made the major contribution toward hiring a Quranic teacher (fqih) to teach in it. He died shortly after the Second World War, but his sons and widows continue to reside in the quarter.

The means vary by which residents of Q^ayra quarter claim “closeness” with Hajj Bu Bakr. Most claim closeness by descent and marriage, although in most cases no exact genealogical links can be demonstrated. There are only some thirty dwellings in the quarter, but when I asked residents to enumerate them for me, several were invariably excluded. These turned out to be living units which somehow did not qualify as households—men sleeping in shops; the dwellings of several poor and often childless couples; and all those people excluded from the circle of closeness for some assumed moral defect. These nonhouseholds did not share the visiting patterns of the counted households of the quarter or engage in their multiple reciprocal exchanges.

It is useful to examine the asserted ties of one informant in detail, since they illustrate virtually the entire range of means by which closeness can be claimed. Ma^ctf (I)[131] , a local shopkeeper, at first claimed that Bu Bakr was of his “blood” (min dammi). This, he elaborated by claiming that the relation was through his “father’s brother” (3), who had married a woman of Hajj Bu Bakr’s household. In itself this notion is interesting for such a tie would not be considered “blood” in our own concepts.

In another context I had earlier asked Ma^cti to tell me whom he considered his kinsmen. I was preparing a “formal” kinship chart, as do many anthropologists, diagramming in an abstract manner his claimed relatives. When I reminded him that previously he had said that his father had no brothers, he replied that, since he was “close” (qrib) to Hajj Bu Bakr, then it must be through a half-brother of his grandfather (5). In other words, the knowledge of closeness came first, then its justifi-

Asserted kinship link

cation. He continued that there “probably” was a second link through the marriage of his mother’s sister (4), who also lived in the same quarter. Again, this tie could not be demonstrated. Finally, Ma^ctf said that Bu Bakr’s people act os if (h-hal) they are related (flrlb')' so they must be; and he cited at length the informal visiting patterns which prevailed between their households. No one can remember such genealogical ties clearly, he said; and although—in perfectly comprehensible Catch-22 reasoning—no one can verify them in any exact way, they must exist.

He went on to link himself in a similar manner with a minor, but locally significant, government official (2) also of the quarter founded by Bu Bakr and related to Ma^cti through the marriage ties of his brother and sister. The tracing of significant kinship ties through affines and the bilateral reckoning of kin in practical social contexts is a very common feature of Moroccan notions of kinship, the formal emphasis upon the ideology of patrilineal descent notwithstanding.[132]

In the “Little Fortress” quarter, as in the ^cArbawi quarter, both “kinship” and involvement in local exchange networks are invoked to justify assertions of closeness. Given the role of the maraboutic Sharqawa in Boujad’s past, one way in which the residents of Qsayra sought locally to enhance their prestige was to build a tomb for one of their claimed ancestors next to some of the Sharqawi" tombs on the outskirts of town. The effort ultimately met stiff opposition from the Sharqawi and failed, but its near success nonetheless managed to raise the prestige of the quarter’s inhabitants in the eyes of most other Boujadis because they successfully managed to act together as a collectivity.[133] Significantly, this process of merging social ties based upon asserted kinship and residential proximity is also characteristic of older residential quarters elsewhere in North Africa and in the shantytowns which have grown up around many of the region’s towns and cities.[134]

The overlapping of kinship identities with other forms of identity, including those of residential proximity, is found throughout the Middle East. Fuad Khuri, for instance, has studied the growth of two contrasting suburbs of Beirut, one settled primarily by Maronite Christians, the other by Shl^ci Muslims from southern Lebanon. In both communities, Khuri emphasizes that ties among households were commonly expressed through the idiom of shared patrilineal genealogies, the image of the large extended family (even where particular links were not known with precision), and shared notions concerning a history of common migration and settlement. He further stresses that the use of joint genealogies often shifted with patterns of prestige and influence. Thus when certain individuals and households emerged as prominent, the neighborhood’s conception of shared lineages tended also to shift so that the ideology of social relationships tallied with social realities. Moreover, hotV linkages between persons and groups were expressed remained quite fluid and varied considerably with political and economic circumstances. A prestigious house, with prestige derived from the control of wealth and people, was called a “known” house (bayt maFruf), and “lineages” tended to be built up . around such houses.[135]

Khuri also found that how asserted kinship ties were elaborated and utilized varied significantly with the religious affiliations of the two communities. In both the Maronite and Shi^cI communities, many extended families were organized into family associations, legal entities which served the collective interests of their members in a variety of ways and which depended upon the entrepreneurial abilities of their organizers. Associations founded by Shl^cT extended families exceeded those founded by Maronites at a ratio of 19 to 2. Khuri attributes this significant difference to the fact that the Maronite church has an effective organizational structure which provides a number of community services, while among the Shl^ca, who lack the equivalent of a

“church” structure, such community structure depends more exclusively upon family associations.[136]

*** Practical Kinship: Some Analytical Considerations

So far in this chapter I have emphasized the flexibility with which notions of family and interpersonal relationships are conceived and utilized. Because of the many variations in cultural concepts of social identity which occur throughout the Middle East, it is especially important to understand how anthropologists seek to explain and to document these notions. For this purpose, the best available account in my judgment is Hildred Geertz’s “The Meanings of Family Ties,” based upon extensive field research in the town of Sefrou, Morocco, in the 1960s. Essentially what she does is to describe (1) prior anthropological approaches to the study of Middle Eastern kinship; (2) the living arrangements—the use of space and the “webs” of relationship in which cultural notions, of kinship are used to inform and to interpret social action; (3) cultural understandings or “constructs” concerning family; and (4) how marital choices are made and their significance in the study of kinship. Geertz’s account has the crucial advantage of thoroughly stating her theoretical assumptions, unlike other outstanding but more specialized studies in which such assumptions and issues of methodology remain largely implicit. The sections in which Geertz describes why she became increasingly uneasy with the earlier anthropological assumptions concerning kinship make her analysis particularly worthwhile.[137]

After a brief review of prior studies of Middle Eastern kinship, with their emphasis upon lineage theory and the so-called “preference rule” for father’s brother’s daughter (bint ^cnmm) marriage, Geertz situates the study of kinship concepts and ties in the wider context of the complementary notions of friendship and patronage because the lines between these various forms of relationships are not sharply drawn in the Moroccan context. To document the practical contexts in which notions of personal and family relationships are elaborated, Geertz describes in detail the kinship ties and living arrangements of one of the wealthier and more conservative extended families of high status in Sefrou. This extended family is admittedly not typical, but, as Geertz argues, the fact that it is tightly organized and possesses other unique characteristics makes it easier to discern in it “the underlying patterns which inform familial relationships.”

The houses of the ^cAdlun extended family tend to be clustered in a neighbor-

hood or quarter (darb) which bears their name. Geertz proceeds to describe in detail how space is used in this quarter and more particularly in one of the oldest, largest, and most distinguished of the ^cAdlun houses, called Dar Bu ^cAli (“the house of Bu ^cAE”). As she points out, many of the larger houses in the older sections of North African cities now tend to be subdivided and tenanted by unrelated poorer families, but in the case of Dar Bu ^cAli, eleven related adults, including

several married couples (and in the past, their servants), share the same house, j Twenty-five other adults living elsewhere are also associated with the household. [As Geertz emphasizes, the notion of “house” deserves particular attention.

The house is known by the name of the dominant adult male (or ancestor) associated with it. Such a person is known as the “owner” or “master” of the house □ (mul ad-dar). In this case, Bu. ^cAU was the paternal grandfather of the older residents of the house. The inhabitants of the house, including its women, are collectively known as the “masters” of the house (mwalin ad-dar). But there is no sharp dividing line between members of the household and other relations. Bu ^c All’s claimed descendants are sometimes referred to as “Bu ^cAJFs people” (rias Bu ^cAli); ! “Adlun refers to the entire extended family, but there is no sharp division made

! between rias ^cAldun and nas Bu ^cAfi. The connotations of both these terms and of

I family (^ca ’Ha) are multiple and refer to a number of overlapping categories of kins- I men. Bu ^c All’s people (rias) are not just a neatly delineated subdivision of the ^cAdlun people. The two terms have a variety of connotations, none of which is necessarily primary. The categories cannot be accommodated by lineage theory.

In the past, a number of material circumstances encouraged the daily interaction of quarter residents, especially the women. To a more limited extent this remains the case today. In the past, when there was no piped water-many of the poorer households are still without it—the women of the household had to use a public fountain. The shared fountain, a public bath in the quarter constructed by the ^cAdlun family, inheritance laws which tend to subdivide the ownership of houses among relatives who thus share common economic interests, and the use of space such as rooftops (from which Women from different houses often can talk with each other as they do their chores) all continue to facilitate interaction among neighbors and kinsmen and frequently to blur the distinction between the two categories.

Geertz’s discussion of the web of actual social relationships has a special interest for the anthropological study of kinship because she poses a series of related questions which form comprehensive guides to the study of practical kinship in a number of contexts. As she explicitly acknowledges, her own study is □ based primarily upon the study of a single high-status urban extended family, an example appropriate for her own particular argument because of its complexity. The issues she poses, however, can be used to make sense of practical kinship in a number of other situations, as I shall suggest by indicating how they

can be elaborated and clarified by studies of kinship and domestic organization carried out elsewhere in the Middle East.

Geertz's first issue concerns the size and scope of the daily interacting group of relatives and neighbors, especially women. In the residential quarter described by Geertz, the clustering of houses, the shared water resources, the communal expenses such as the maintenance of a small mosque, and the large number of kinsmen living with each other mean that many relatives have intense daily contact. Of course "relations" means not only persons patrilineally related, but also those related through marriage and matrilaterally. Often through generations of marriage, kinship ties become extremely dense so that people are related to one another in all three ways. Muslims are permitted to marry their first cousins and when such marriages occur the result is to strengthen the multiple ties among relatives. As Geertz explains, "one's cousin is also one's brother-in-law, one's ex-husband has married a woman next door, one's uncle is one's father-in-law, one's husband is a former playmate, and one's child seemingly is shared by everyone."[138] Additionally the feelings and activities of neighbors and relatives in such close physical proximity mean that their behavior is "entirely a matter of open argument

FIGURE 6-3 Returning from market In town, Morocco. Lack of vailing often indicates rural origin or lower social status In North Africa. (Courtesy Paul J. Sanfaqon.)

and explicit social pressure."[139] This constant pressure of "publicity," to use Geertz's appropriate term, is an integral part of Moroccan family life and makes privacy and concealment often difficult to obtain.

Of course, residential patterns do not always place relatives in such close physical proximity, but such a pattern is frequent. Khuri's study of two suburbs of Beirut, already discussed, provides an example in historical depth of a pattern

FIGURE 6-4 Woman spinning, southern Iraq. (Courtesy Robert A. Fernea.)

broadly analogous to that described by Geertz. as does Antoun's study of a Jordanian village. [140]

Geertz's second point draws attention to the boundary between informal ("private") and formal ("public") spheres of social action. In the "conservative" setting that she describes, the higher the status of women, the less they are seen in public, although there is considerable variation between generations and according to whether women are young or old and unmarried or married. Age, social status, education and many other complex factors

enter into how and when a veil and other covering garments are worn. How these clothes are worn symbolizes the division between the public and the private spheres of action.

In rural settings in North Africa, for instance, women often go unveiled, although they will conceal themselves and act with socially appropriate modesty when strangers are present. In urban settings, women commonly are unveiled before marriage but assume the veil after marriage. The use of the veil can often serve as an indicator of higher social status, although once again there is considerable flexibility as to when and where it will be used. Younger educated women, for instance, are socially freer not to use the veil and to find other means of indicating propriety and status. In comments on the use of veiling in Iran, Michael Fischer suggests that it , serves as a “complex moral device” which operates in the domains of modesty where “proper” comportment varies with social space and behavior, status manipulation, and religious-political identity and serves as a marker of the religious group—Muslim, Jew, Bahai, or Zoroastrian. The veil is also at times a powerful political symbol. Fischer’s analysis of. the component of status manipulation in the use of the veil indicates just how complex this dimension (and the others) can be ,.

Not only are veils rough markers of stratification, from villages (in the past and still today often headcloths without chadors) to lower-class urban (veils tied around the waist to allow free use of hands when working) to traditional upper class (full veiling whenever in public); but veils are also markers of intimacy from sons, brothers, husbands (no veils) to close friends and near kin (loose veiling) to the stranger (veiling to the point of covering all but one eye). Modern status, today, is marked by being without veil or with a pastelcolored or transparent veil, or by wearing the veil halfway back on the head so as not to cover all the hair.[142]

Based on their work in western Turkey, Lloyd and Margaret Fallers point out that one of the consequences of the traditional separation of the worlds of men and women outside the domestic realm is that Turkish women have been at least psychologically more independent than their American counterparts. As they participate increasingly in the academic, business, and professional worlds, Margaret

FIGURE 6-5 Vailing and head covering can communicate a variety of statuses and attitudes. Group of women wearing the traditional San^cS' cloak (sitara). (Photograph by Dr. Ronald Lewcock, from City of San^ca', ed. James Kirkman [London: World of Islam Festival Publishing Company Ltd., 19761. Courtesy Middle East Centre, Cambridge.)

Fallers claims that women in Turkey appear to have fewer obstacles to professional advancement than has been the case until recently for American women, although as economic and social circumstances increasingly favor the emergence of singlefamily households, women somewhat paradoxically again become more dependent upon men.[23]

The third issue in the analysis of practical kinship is the prevalent patterns of hospitality and visiting that prevail among relatives and nonrelatives. In the Moroccan context, there is continuous visiting among relatives and neighbors, and when relatives are neighbors, these patterns of activity are particularly intense. There is also considerable visiting among relatives and close friends at greater distances. AsHildred Geertz indicates, men are considerably more mobile than women, but even their travel patterns are “to a striking degree determined by the location of family connections.”[24] These patterns vary considerably according to whether members of the family are urban or rural, wealthy or poor, concentrated in one particular locality, or widely dispersed. Even with the impact of the modern

[23] Lloyd A. and Margaret C. Fallers, “Sex Roles in Edremit,” in Mediterranean Family Structures, pp. 243-60. The Fallers’ study is particularly useful because it presents sketches of a variety of Turkish men and women, thus indicating the nuances of how the division between the public and private spheres shifts according to circumstances of wealth, education, region, generation, and other considerations.

[24] In H. Geertz, “Family Ties,” p. 334.

economy and its pressures, at least among the educated middle classes, who occupy modern housing in which it is difficult for relatives to be immediate neighbors (as was traditionally the case), Geertz finds a persistence of strong familial ties expressed in patterns of visiting, a trend largely confirmed by studies conducted elsewhere in the Middle East,
[143]

A fourth issue in the analysis of practical kinship is the relative importance of the conjugal family in Middle Eastern settings. In the residential quarter described by Geertz, the conjugal bond is only one of many cross-cutting ties of kinship and affinity, so that household units are not built primarily around the conjugal bond. In an older pattern of polygamous marriages (by Islamic law men are permitted up to four legal wives) which is rapidly diminishing in incidence, affinal links through women were used by wealthier individuals to secure complex political and economic alliances. Still, the overall trend throughout the Middle East is toward separate housing for each nuclear family and the strengthening of the conjugal bond, with the consequences of shifts in the tenor of relationships among members of the family. Mubeccel Kiray argues that a wife’s sfttus rises when she lives alone with her husband and children rather than under the same roof with her husband’s relatives, although the woman also becomes more dependent on her husband. She shares more in the decision making of the household and in many of the activities of her husband. Extended families remain very important even when such relatives are not living in the same house or immediate neighborhood. Kiray argues that the changes which have occurred with large-scale labor erhigration to Eutope-a trend now diminishing in importance-and other economic and political shifts have brought about fundamental reinterpretations of family and kinship

roles. At the same time, she sees a continued importance in the role of the extended family and in the bonds of obligation and trust which unite family members, facilitate their movement from one region of the country to another, and secure employment.[144]

The complexity of housing patterns and variations in them must be noted. In a study of 140 households in Isfahan, John and Margaret Gulick report that fifty- five compounds, or housing units, were composed of a single nuclear family, but eighteen of these also had other patrilineal and matrilineal relatives present. The rest of the compounds consisted of multiple households in which two or more married couples resided. A particular value of the Gulick study is that it provides almost case-by-case descriptions as to why persons have chosen or were compelled to accept particular residence patterns. Studies conducted elsewhere, including the

Egyptian Delta region, similarly emphasize the considerable variations' in household composition, many of which are not related directly to issues of tradition or modernity but to changes in the domestic cycle as persons marry, raise children, age, and establish some degree of autonomy by setting up independent households when economically feasible?[7]

A final consideration is the linkage between kinship and patterns of social status, influence, and authority. Hildred Geertz suggests that economic and political achievement in Morocco is “almost entirely an individual matter. An ambitious man may use the help of kinsmen in his climb, and in return may help them, but these exchanges are personally arranged and by no means obligatory.”[18] Significant, ranges of wealth can be found within a single extended family, and Geertz provides numerous case studies indicating this variation. At the same time, it remains true that the presence of powerful and influential individuals within a single extended family substantially increases the likelihood of the next generation of that family possessing a competitive advantage in retaining their social status. Studies of rural leadership in Morocco suggest that despite the changes from the precolonial regime to colonial domination and later to independence, economic and political advantage has often remained within the same extended families, although not without substantial challenges?[9] The same phenomenon holds for local and national leadership in Saudi Arabia, as the earlier discussion of Cole’s study indicated, and elsewhere in the Middle East.

Similarly, how family ties are articulated depends substantially upon the economic situation of the families involved. Maher, in her study of a small town in Morocco’s Middle Atlas region, suggests that marriages are much more stable among the urban middle classes than among the less economically affluent in rural areas. When the main inheritance is land, men and women are likely to retain important shared property rights and service obligations with their own kin, and such ties tend to be incompatible with a primary allegiance to the spouse. Marriages in such circumstances are arranged less with a view to conjugal happiness than to serve the temporary interests of those who arrange them, the parents of the spouses and the

intermediaries.[145] Maher estimates that for 70 percent of the population of the town she studied, marriages served to maintain the economic and social status quo of the couple. For another 20 percent it meant cultural assimilation to the Arabized and politically dominant group (she studied in a Berber-speaking region); for the remaining 10 percent, the urban elite, women possessed movable capital as opposed to land rights. Marriage with such women was regarded principally as alliances with long-term economic and integrative significance between extended families and hence marriages tended to be more stable. For groups lacking such capital, divorce entailed no significant loss of capital as there was none to lose. This was decidedly not the case for the urban elite.[146] Clearly any study of kinship which neglects the practical domain of economic relationships, as many studies have tended to do in the past, must b,e treated with some caution.

*** Marriage

“Arranging marriages is a highly serious matter, like waging war or making big business deals.”[147]

As the above statement suggests, marriage in most Middle Eastern contexts involves not only the personal wishes of the man and woman concerned but the responsibility of many of their respective relatives. In the past, at least among wealthier families, marriages could be said to have been almost entirely the ultimate responsibility of the father or guardian of a

boy and girl, although under contemporary circumstances this is no longer the case. Actual marriage practices vary significantly throughout the region, so that studies of particular locales must be consulted for appropriate ethnographic detail. In general, however, the fact remains that marriage choices usually are made by a group of people from the extended families of the conjugal pair, whether the marriage is among Muslims; Christians, or Jews and that marriage notions like those of ideas of family can serve as another indicator of shared assumptions concerning the nature of the social order.[148]

Since some of the principal examples stressing notions of kinship have come from Morocco, where many of the critical reappraisals of notions of kinship have been conducted, let me provide a further example from that country. Much depends upon the social status and educational background of the couple to be married. Half a century ago in upper-class families, in general the persons to be married had litfle say in the choices imposed upon them; today, of course, this is no longer the case. In the case of a young man with a living father, his father is expected to take a significant role in the negotiations, and the same is true for a young woman. Now men, if questioned, will aver that marriage negotiations are their concern alone, since they claim to have an understanding of the social obligations involved superior to that of women. Women will take a very different view of the process involved and will in fact take quite an active role in the suggestion of marriage partners and in preliminary negotiations.[149]

In the first stages of such discussions, informal go-betweens are often used. These are chosen from among kinsmen and friends thought to be trusted by both parties. For example, a young man might use a trusted school friend to sound out the other family - or his own sister or mother. Who is selected to explore such possibilities depends upon the social ties between the parties involved and cannot be predicted from abstract considerations of kinship roles alone. Women’s baths and social gatherings involving women exclusively are one place where exploratory talks can take place. After all, as one Moroccan woman explained to me, since. Moroccan men presume that women tend to have less “reason” (fqal) than men, with reason being defined as the ability to act effectively in a wide range of social situations,[150] women are especially useful in such exploratory discussions since anything said by women can be denied by men as not accurately representing their views. Although formally the initiative is supposed to come from the groom’s family, the bride’s family often takes the initiative, especially if there have been previous marriages between the two extended families or if the marriage is within the extended family itself, as is the case for father’s brother's daughter, or “parallel cousin” marriages, which are permitted in Islamic law.

If the suggestion of a marriage is accepted, then discussions follow concerning the probable date of the wedding and the conditions to be included in the marriage contract (a woman can, for instance, specify that her husband may not take a second wife without granting her a divorce). The subject of the most protracted negotiations is the size of the bridewealth (sdaq), or the sum which the groom’s family must pay over to the bride’s family, part of which goes for the provision of certain furnishings which remain the personal property of the wife. The bridewealth payment is not usually paid in full but is used as a

device to discourage a husband’s seeking divorce since in such an event the wife or her family can demand the balance of the agreed sum.

The amounts involved in bridewealth payments have escalated significantly in recent years, and a discussion of how much is involved will indicate why negotiations are taken very seriously. Rosen reports that in the late 1950s the amount involved for a well-to-do family was only a few hundred dollars but had reached as much as $ 1,000 by 1970.[151] Yet the bridewealth is only a part of the costs involved. Because the ceremonies involved in marriage importantly indicate to the wider public the social standing of the couple, the expenses for gifts and entertainment are often excessive. A 1975 study conducted in Fez estimated that the cost of marriage for a young junior civil servant, including all gifts and the multiple entertainments of guests, came to approximately $14,000. Of this, the groom’s family contributed $5,000 and the bride’s family the rest. The overall cost was approximately that of the income of the married couple for a period of four years. For the more modest wedding of an ordinary worker, costs were estimated at $1,900, with $1,314 paid by the groom’s family and the rest by the bride’s. The overall expense equaled the man’s estimated income for the first twenty-two months of his marriage. With the cost of marriage so high, many couples prolong their engagement for several years In order to acquire the resources they need in order to afford marriage.[153]

Once the negotiations of financial arrangements are satisfactorily concluded, the fathers of the bride and groom or the relatives acting as their guardians sign a formal agreement before a notary, although there still are marriages in rural areas where the older tradition prevails, at least among families with very modest resources, of simply concluding agreements in front of reliable witnesses so that the matter, if contested, can later be brought before a court. Either procedure is regarded as legally binding and closely precedes or follows the khatba, the public formal request for the woman’s hand during a ceremonial dinner at her home.

The engagement, or khatba, usually is preceded by a large gift of sugar, publicly delivered, to the woman’s household. If the families involved are well-off, this will be delivered with musicians and a number of women from neighboring households joining in. In general, the more socially prominent the families involved, the more public is the delivery of the gift. Families of lesser social prominence and wealth will tend to be more circumspect in the announcement of an engagement. If their gift is not declined, then the engagement feast takes place the following day.

As stated earlier, the actual wedding may be delayed considerably after the formal legal agreement. Not only are financial considerations involved, but in many Middle Eastern cities there is an acute housing shortage, so that many couples postpone living together and having children until suitable accommodations can be found and until they can afford to live together.

Shortly before the actual wedding, the bride's family delivers to the groom's house the various goods purchased with the bridewealth—mattresses, blankets, trays and silverware, cups, clothing, cooking utensils, and so on. For modest families, the procession may be very short and circulate only in the immediate residential quarter. For the weddings of more substantial families, goods are carried on flat-bed trucks and are circulated throughout the town; accompanied by musicians drumming and playing woodwind instruments and clapping and dancing by at least some of the women of the households involved and their neighbors. These occasions are clearly ones of considerable status competition, for they are the means of publicly announcing the social standing of the couple and the prestige of their respective extended families.

On the day of the wedding, a farewell celebration is held at the bride's house. At the groom's house, in the meantime, there is a long evening of feasting and talking. Later, some of the groom's relatives, but not the groom himself, set out to take the bride from her home. There is much weeping and crying as the bride is taken away from her family.

Upon arrival at the groom's house, the bride is ceremonially dressed in wedding clothes—heavy layers of fine brocades and jewels, often rented. The groom finally leaves his guests, lifts his bride's veil, and drinks milk with her and offers her dates. Depending on the region of the country, close relatives and kinsmen may visit the new couple briefly at this stage, or not at all. Wedding gifts are presented at this time, with each gift publicly announced and displayed. The wedding party continues throughout the night, culminating, so to speak, when proof is brought in to the guests of the bride's virginity. In country weddings, this is done by having a hired female dancer place a tray of fruit on her head, over which is placed a handkerchief spotted with the bride's virginal blood. As more Moroccans become exposed to western and urban sensibilities, the practice ofinsistingupon such direct confirmation of virginity is gradually disappearing. Several days of feasting often follow, during which the bride is expected to feign exhaustion and remain immobile, visited only by her close female friends. Perhaps in part to accustom the bride to her new surroundings—when indeed the bride and groom are not previously related—and to accommodate her to new patterns of domestic authority, the bride will not see her father, brothers, and other male relatives for at least three months.

Moroccans, as well as other Middle Easterners, stress the multiple forces involved in marriage arrangements, of which the feeling of the man and woman for each other is only one factor. The total social networks of the two are more or less directly involved and enter into calculations as to what is a good marriage. Statistics on marriage and divorce are hard to come by because most experts acknowledge that divorces which do not involve property settlements go largely unreported in most Middle Eastern countries. In one village setting in Morocco studied by Vanessa Maher, 49 percent of all marriages ended in divorce and this figure appeared to be relatively constant for those born between 1895 and 1915 and in later generations. Maher's study brought out significant contrasts between marriage stability in the rural setting and in the neighboring town which served as a regional administrative center. Divorce rates were highest in the village—52 percent—as against an average of 38 percent in the town.[154] Maher states that the crucial factor in determining the rate of

divorce was the economic and social situation of women. If inheritance was in land instead of liquid assets, if minimal bridewealth was paid, if the bride was young (80 percent of marriages of women under the age of fourteen ended up in divorce), and if each marriage partner retained stronger links with their natal family than that of their spouse-all factors more prevalent in the village as opposed to the town—the divorce was more likely. Another factor is whether a couple has children, Until a woman has children, it is often the case that her primary source of moral—and sometimes financial—support remains her own kin. She can always go back to them if the need arises, and this option is often exercised and remains open even after the couple has children.

*** The Importance of Kin and Family

Marriage strategies and patterns of kinship obligations reveal underlying notions of personal identity and conceptions of the social self. There has been a tendency in earlier writing on the Middle East to treat kinship rights, practices, and obligations as self-contained objects that can be reduced to fixed rules or normative structures which generate the various practices analyzed by anthropologists. As a consequence, much of the literature on Middle Eastern kinship has for a long time been dominated by an emphasis placed upon the importance of father’s brother’s daughter marriages and upon the significance of genealogies as a means of determining social and political obligations in a wide range of contexts. The prior attraction of these two topics is worth considering in detail.

Father’s brother’s daughter (bint ^camm) marriages are permissible in Islam, as stated earlier, and at least in some social contexts Middle Easterners assert that such unions are preferred, to the point of saying that if a woman and her family choose not to marry a father’s brother’s son, his consent and that of his family must first be obtained.[39] Proverbs are sometimes cited as evidence for this preference, but proverbs stating contrary opinions toward such unions are equally prevalent. Thus the Moroccan proverb in favor of bint ^camm marriage, “He who marries the daughter of his father’s brother is like him who celebrates his feast with a sheep from his own flock“ (that is, one who shows wealth and prestige by having sufficient resources within the family on which to draw) has its contrary in “Keep away from your blood before it defiles you” (in quarrels between the relatives of the spouses).'[10] Some anthropologists have sought to document the statistical rate of actual occurrence of such marriages, although, as has been indicated in earlier contexts, how certain relatives are designated in social practice is not so straightforward but depends upon the tenor of existing social relations. Other authors have confined themselves to assuming that such marriages are normative and preferred. For those interested in the statistical incidence of bint ^camm marriages, they appear to vary from 43 percent in tribal Kurdistan to 2 percent in Lebanon.

[39] For example, Antoun, Arab Village, p. 74. Donald Powell Cole, Nomads of the Nomads: The Al,Murrah Bedouinof the Empty Quarter (Chicago:

Aldine Publishing Company, 1975), pp. 71-72, states that the Al Murra “prefer” bint ^camm marriages but explicitly states in practice this means that marriages within lineages or with persons of equal status are preferred. Because the topic has held such fascination for anthropologists concerned with the Middle East, it is useful to present a brief listing of the standard articles dealing with the subject. These are as follows: Fredrik Barth, “Father’s Brother’s Daughter Marriage in Kurdistan," Southwestern Journal of Anthropology, 10 (1954), 164-71; Millicent Ayoub, “Parallel Cousin Marriage and Endogamy: A Study in Sociometry,” Southwestern Journal of Anthropology, 15 (1959), 266- 75; Robert Murphy and Leonard Kasdan, “The -Structure of Parallel Cousin Marriage,” Arneri: can Anthropologist, 61 (1959), 17-29; Raphael Patai, “The Structure of Endogamous Unilineal Descent Groups',” Southwestern Journal ofAnthropology, 21 (1965), 325-50; John Gilbert and Eugene Hammel,< “Computer Simulation and Analysis of Problems in Kinship and Social Structure,” American Anthropologist, 68, no. 1 (February 1966), 71-93; Robert Murphy and Leonard Kasdan, “Agnation and Endogamy: Some Further Considerations,” Southwestern Journal of Anthropology, 23 (1967), 1-13; Harvey Goldberg, “FBD Marriage and Demography among Tripolitanian Jews in Israel,” Southwestern Journal of Anthropology, 23 (1967), 177-91; Fuad I. Khurl, “Parallel Cousin Marriage Reconsidered: A Middle Eastern Practice That Nullifies the Effects of Marriage on the Intensity of Family Relationships,” Man (N.S.), 5, no. 4 (December 1970), 597-618; Jamil Hilal, “Father’s Brother’s Daughter Marriage in Arab Communities: A Problem for Sociological Explanation,” Mid East Forum, 46, no. 4 (1972), 73-84; James M. B. Keyser, “The Middle Eastern Case: Is There a Marriage Rule?,” Ethnology, 13, no. 3 (July 1974), 293-309; and~an article which like Keyser’s has a broader perspective-Michael E. Meeker, “Meaning and Society in the Near East: Examples from the Black Sea Turks and the Levantine Arabs,” International Journal of Middle East Studies, 7, no. 2 (April 1976), 243-70, and no. 3 (July 1976), 383-422. Peters, in “Aspects of Affinity,” p. 61, refers to the analysis of “explanations” of. bint ^camm marriage provided by one author as “a veritable thesaurus of errors.” By far 'the best account of the whole issue, despite the author’s difficult style of presentation, is contained in Bourdieu’s Outline, pp. 30-71, which includes a historiographic discussion of why anthropologists got interested in this issue to the exclusion of other issues in the first place.

[40] Cited in Edward Westermarck, Wit and Wisdom of Morocco (New York: Horace Liveright, Inc., 1931), p. 72.

In most communities, Richard Antoun estimates that its incidence is approximately 10 to 15 percent of all marriages, although such estimates often are made from incompatible assumptions and should be treated with caution.[155]

The enormous literature on the subject must be consulted to savor fully the nature of the bint ^camm debate, but examples of several of the issues involved are appropriate here. Keyser, following Patai, indicates that there are four principal reasons advanced by Middle Easterners for the bint ‘own preference:

1. It preserves the patrimony within the agnatic unit.

2. It strengthens the defensive unit.

3. It confers stability on the household unit,

4. 4. It insures that the status of the partners is equal.[156]

As he summarizes them, the grounds against such propositions are the following. In regard to the first one, women do not inherit equally with male children in Islamic law and in practice often do not inherit at all. Moreover, although such marriages may appear endogamous to Western eyes because in our own system of kinship reckoning such marriages are prohibited, this is not the case in the Islamic Middle East. Bint ^camm marriages do not fall within an economically defined corporate group. There may be economic gain in such unions, but there may be economic gain in a number of alternative unions as well.[157]

The second argument is related to the notion of kin-vengeance groups, examined in some detail in Chapters 4 and 5. Keyser points out that the proponents of such arguments, notably Barth, have failed to provide specific examples and to indicate that persons who contract such marriages are better off economically and politically than those who do not. As.for its conferring greater stability on household units, again evidence is lacking. Maher’s evidence on marriage stability indicates that a number of other factors enter into consideration as to whether marriages and households are stable or not.[158] Keyser rather nicely states: “If it is possible for people to like each other only if they know each other, it is also possible for people to hate each other only if they know each other, and marrying within one’s own household could be as disruptive and traumatic as not.”[159] The final argument concerns the “equal” status of the marriage partners. Equality (kafa’a) is a principle enshrined in Islamic law, but whether this principle is defined in economic, social, or other terms is a contested matter. For bint ^camm marriage to insure equality of status, however the notion is defined, it is necessary to make the further assumption that brothers are always equal, which is decidedly not the case.

The explanations for bint^camm marriage preferences, as Keyser points out, often take curious turns, as when a discussion of parallel cousin marriage for the

entire Middle East is supported by evidence solely from the Bedouin of the Syrian desert or when kinship ideology is confused with the biology of descent. Keyser's own argument, based upon plausible documentation from field research in Turkey, is that the "preference" for bint ^camm marriage can best be interpreted as a metaphorical statement which expresses what respective relatives through marriage should ideally be.[45] In reference to the particular issue of bint ^camrrt marriage, this is the most plausible argument put forward, for it focuses attention upon the cultural values of family and kin relationships instead of a single, exotic (for nonMuslims) marriage strategy.

The emphasis placed upon genealogies, especially patrilineal genealogies, can be dealt with more summarily as it already has figured significantly in Chapters 4 and 5. Some anthropologists' emphasis upon bint ^camm marriage has unduly highlighted only certain of the "most remarkable" marriage strategies rather than the entire range of available marriage strategies. Similarly, many anthropologists have taken the importance of genealogies for granted and have analyzed them as static ethnographic artifacts, ignoring how they are used. In my own ethnographic experience, people's use of complex genealogies tends to be correlated closely to wealth and social class. Individuals who have something to gain by imposing their interpretation of genealogies upon the social order tend to do so. It would be considered inappropriate in both tribal and nontribal settings for persons without claims to high social status, as such status is variously defined, to make elaborate claims of descent. Although the anthropological literature is filled with downward-branching diagrams such as Figure 5-4, a number of anthropologists have found that such charts can often be constructions based on the anthropologist's ideas rather than on a meaningful representation of how kinship relationships are conceived by Middle Easterners themselves. Hildred Geertz describes with some amusement her frustration at trying to show informants how to construct logically ordered kinship diagrams. Her findings are better approximated by Figure 6-6, in which informants first thought of a prominent ancestor or living person, then of clusters of indi-

FIGURE 6-6 A Moroccan conception of ''closeness." {From Dale F. Eickelman, Moroccan Islam, p. 208. Courtesy of the author and the publisher.)

viduals related to each of them.[161] The relationships among the various prominent ancestors were not clearly defined but were spoken of as being of "one family." Such a means of representing notions of kinship may not work everywhere in the Middle East, but it is useful to present an alternative to the earlier analytical frameworks which are proving increasingly unsatisfactory.

In discussing the significance of genealogies, Bourdieu argues that anthropologists have in the past tended to neglect the role of genealogists and the significance of the occasions when a genealogical representation of relationships (as opposed to other representations) is invoked. In drawing up genealogies for analysis, he argues that anthropologists easily forget that genealogies are the product of multiple strategies and thus treat the meaning of kinship relations genealogically defined as a resolved question.[162] Instead, anthropologists should seek to specify the types of situations in which the use of genealogies and relationships defined by them are particularly dominant. Although emphasis is placed upon patrilineal relationships, matrilateral relations can be shown to have equal importance in many social situations, although they have tended to be neglected as they are not “official” genealogical representations of the social order.[163] As Bourdieu illustrates through detailed examples drawn from the Kabyle of Algeria, marriages which are genealogically identical may have different, even opposite, meanings and may be the outcome of very different strategies involving a wide range of symbolic and material interests such as fertility, filiation, residence, inheritance, marriage, and the values of honor and prestige.[164]

A brief practical example from the Morocco of sixty years ago might prove useful. Just after the French gained effective control of one of the southern regions of the country, a new, rather brutal Moroccan qa’id, or tribal administrator, was put in charge of a region which included a large village in which one of the most respected notables was a pious, aged notary who was regarded almost as a saint by surrounding tribesmen. The qd’id soon had a falling-out with the notary and slapped him on the face in public during one of the weekly markets. Soon after, the qa td was told by one of his confidants that a tribal rebellion was in the making because of the slap. So at the next weekly market, the official brought one of his daughters and publicly threw her at the feet of the notary’s eldest son (then in his twenties), saying: “She’s yours. If you don’t take her, she can go kill herself.” Confronted with such an act, the notary’s son was. compelled for the sake of Ms honor to marry the girl. Essentially, her father publicly declared that he repudiated all responsibility for her honor and transferred it to the notary’s son; marriage was the only legitimate sort of relation he could have with the girl. (The formalities for a valid Islamic marriage were subsequently resolved.) The offer of his daughter effectively neutralized the offense of the slap.

The marriage turned out to be a success in both personal and political terms. A few years later, a younger son of the notary married his older brother’s wife’s sister, further strengthening the bonds between the two families. The initial act was a boldly successful political move. The second marriage had a political element, but there were other considerations, including relations between the two brothers, who were at the time living in the same household. Most marriage decisions show a subtle combination of various strategies which cannot be derived from rules or prescriptions, and the anthropologist’s principal task is to see the underlying assumptions toward the social order which these strategies reveal, not to reduce their complexity to a single, simplistic “rule,” such as bint ^camm marriage.

A good way to conclude this chapter and to place the legacy of earlier anthropological studies on kinship in the Middle East in perspective is to cite a recent essay by Constance Cronin on kinship among the Iranian elite. Cronin's earlier work concerned Italian immigrants in Australia, so when she began to work in Iran, she did not share the presuppositions that many scholars working principally in the Middle East took for granted concerning what Middle Eastern kinship was all about.[165]

Cronin writes that most of the work on Iranian kinship was a poor carbon copy of the prevalent assumptions concerning Arab kinship, placing undue stress upon the importance of patrilineal genealogies, extended families as corporate units, and rigid marriage rules concerning parallel cousin unions. In speaking both of the "traditional" (Cronin is decidedly uneasy with the term) family and contemporary ones, she says there is no marked discontinuity between past and present. Data which she collected from older informants suggested that they had a bilateral kinship system, despite the fact that patrilineal genealogies were verbally displayed for limited purposes such as responding to questions put by anthropologists. Whenever economically possible, nuclear families lived apart, and close- knit families (in the sense of taking collective actions) were the exception rather than the rule. There were few jointly held investments; important decisions were made household by household without necessarily consulting others in the extended family; patterns of obligations toward relatives were highly flexible and often indistinguishable from those of close friends.

Richard Antoun has written that any scholarly approach which concentrates almost exclusively upon one type of kinship tie or social relationship and the "problems" derived from it constitutes a "museum" approach which creates artifacts of kinship exotica.[166] Although it can be argued that his comment unjustly characterizes current trends in museology, I concur with the intention of his comment. Kinship relationships should be treated as something which people make and with which they accomplish things. Such a notion is not exactly startling in its novelty, although meticulous descriptions of how social identities are elaborated and manipulated and which do not treat them as fixed ethnographic objects are still fairly rare. Kinship studies have often been considered to be an arcane anthropological preserve, except when more general writers choose to make sweeping generalizations concerning the importance of family ties in the Middle East. This chapter has suggested a less arcane way of looking at Middle Eastern notions of social identity and how they work.

** 7. Change in Practical Ideologies: Self, Sexuality, and Ethnicity

The paradox of studying cultural meanings, and the practical contexts in which they are generated, maintained, and transformed, is that the relationship between the two is not always direct or predictable. For one thing, patterns of meaning concerning such concepts as kin, family, person, community, and sect do not occur in isolation but are interconnected with each other in complex ways so that change in any one domain is often irregularly

accelerated or impeded. Second, rapid and massive economic and political change affects such notions, but again the influence is often uneven and not fully predictable. In periods of crisis or rapid transformation, new ideologies concerning ideas of lineage, tribe, kinship, sect, religion, and nation are often formulated. As indicated earlier, the mere reference to lineage identities is illegal in Somalia, although such identities can be shown to have a continuing, decisive influence on public and private life; Morocco has abolished tribes as political units and replaced them with “communes,” although most communes follow tribal boundaries; other countries have legislated changes in the personal status of men and women which often contrast dramatically with popularly understood rights and expectations. This chapter looks at three of the most sensitive contexts of cultural projections of persons and cultural self: naming, a practice which, because usually not consciously systematized, is a good index of implicit notions of persons and change; sex roles and sexuality, which also are in part regarded as firmly private, immutable, and implicit; and ethnic identities, which have posed special theoretical challenges (discussed later in this chapter) concerning the role of ethnic identities in modern economies.

*** Naming

Patterns of naming provide privileged insight into the assumptions concerning cultural ideas of the person, as S. D. Goitein indicates in his ingenious analysis of female names in the Geniza documents. These documents depict the social life of the Jewish (and Muslim) communities of the southern Mediterranean in the tenth through the thirteenth centuries. Goitein’s analysis has produced a description of the social life and values of the period which is more thorough than that provided by many contemporary ethnographies. In the Geniza documents, women rarely speak for themselves; many were illiterate and even if not were frequently constrained to speak through male guardians. From Inheritance papers, correspondence, and other fragmentary evidence, Goitein nonetheless managed to elicit the implications of naming patterns and what they reveal of attitudes toward self. Names were “living words,” the meanings of which were well known to,those who bestowed them. Moreover, women were primarily responsible for the names which they gave their daughters, so that the meaning of a name and the frequency of its occurrence are therefore good indicators of what a woman wished for her daughter and, by implication, for herself. [167] The wide variety of names given to women possessed a number of common characteristics. In contrast to the names of men, which often contained references to God or to religious concepts, women’s names almost consistently emphasized secular themes. The exceptions were principally confined to upper-class families. Goitein takes the sexual dichotomy in naming patterns to imply a “chasm” between the worldwide Hebrew book culture of the men and the local popular subculture of the women. Additionally, many female names—over 70 percent encountered by Goitein, and an equivalent proportion among Muslim names—suggest ideas of “ruling, overcoming, and victory,” such as Siti al-Kull (“She who Rules over Everyone”), Sitt al-Nds (“Mistress over Mankind”), Sitt al-Fakhr (“Mistress of Glory”), and Labwa (“Lioness”). As he argues, such names suggest a self-image of women other than that of frailty, domesticity, or dependence upon men. Indeed, names implying chastity or fertility, attributes regarded by men as praiseworthy, were almost entirely absent, perhaps because such attributes were so taken for granted. Other names implied noble lineage, or a mere

welcoming of the newborn, such as Muna (“Wishes Fulfilled”), Ghunya (“Gain”), Yumn (“Good Luck”), Sakada (“Long Life”), and Baqa (“Substitute”— for a child who died). Because such names were fairly common, Goitein suspects that they were a protest against the male preference for boys.

In Goitein’s studies and in those of other scholars, changing fashions in naming can also be used as documentary indices of shifting religious and national consciousness, another crucial dimension of ideas of self.[168] One such study is.

Richard Bulliet’s discussion of trends in Turkish naming patterns from the early nineteenth century to the 1950s.[169] For instance, the Turkish names of Mehmet, Ahmet, and Ali are all derived from Arabic and have religious connotations. These names were highly popular prior to the secularizing Ottoman reforms (called the Tanzimat) which were enacted from the 1840s onward. There was a sharp plunge in their popularity until they reached a low in 1885-1889, when the reforming spirit was most intense. Afterward, religious names slowly recovered in popularity, only to reach a new low in 1905-1909, when the Young Turk movement was strong. Later there was a gradual but steady recovery of the incidence of religious names through 1920-1924, after which they maintained a fairly stable level of incidence.

Concurrently, the political circumstances from the rise of the Young Turks in the final years of the Ottoman Empire through the declaration of the Turkish Republic in 1923 were correlated with the replacement of names of Arabic origin with those that were Turkish and secular, reflecting a distinctly Turkish national identity. Such names comprised only 8 percent of the total of the sample in 1910- 1914, rose to 65 percent in the decade of 1930-1941, and have declined only slightly in the years since then. Yet, as Bulliet emphasizes, the new trend in the popularity of Turkish secularized names was not at the expense of names with a religious base, suggesting that despite the militantly secularist ideology of the Turkish state promulgated by Ataturk and his successors, a significant component of the population retained its distinctly religious identity. The recent resurgence of Islamic fundamentalism throughout the Muslim world, including Turkey, reaffirms the continuing importance of religious identity.

Another important dimension of naming as a key to the idea of the person in the Middle East is the fact that there is considerably more flexibility as to how persons can be referred to and addressed in Middle Eastern contexts than in our own. In the early years of French rule in Morocco, for instance, when letters of safe conduct and a system of land registration which required the precise legal identity of persons was being put into effect, it was not uncommon for the French to issue papers which referred to individuals by numerous alternative (and equally appropriate) names.[170] For example, a man called Ahmad could also be known as:

Ahmad wuld Driss al-Baqqal

Ahmad wuld Driss wuld Mustafa

Ahmad “wuld ^cMsh”

Ahmad al-TadilT

Ahmad, son of Driss, the Grocer

Ahmad, son of Driss, son of Mustafa

Ahmad, “son, of the man with poor eyesight” (a nickname)

Ahmad from Tadla

al-Tadili

Wuld Driss

or Ahmad wuld Driss ash-SharqawT

the one from Tadla

son of Dnss

Ahmad, son of Dnss, of the Sharqawi (patronymic association)

Only with the spread of the legal registry of births and the necessity, principally for administrative reasons, of identifying persons unambiguously by a single name, has the variety of naming choices been lessened somewhat. Moroccan naming patterns suggest how flexible are the ways in which persons can identify themselves, although there are variations in how these different components are emphasized through the Middle East. Moroccan names can be composed of the following elements: (1) personal names, such as Muhammad, Ahmad, and Buzkri; (2) nicknames (laqab-s), generally relating to some predominant personal identifying feature, such as “the one-eyed,” “the colorful,” or “the fast one”; (3) names derived from occupation and origin (nisba); (4) patrifiliative names; and (5) “family” names (kunya-s), made obligatory by the government in the 1950s but earlier maintained by wealthy government officials, merchants, marabouts, and descendants of the Prophet (pl. shurfa).[171]

Personal, or “first” names, can be drawn from a range of religious and secular sources. By themselves these names are not always distinctive. In one set of census material, Hildred Geertz found that out of 982 male names, 156 were called Muhammad.[172] . Quite a few names reflect little more than the time of year a child was born. An infant born near the Feast-day of the Prophet (^cId al-MHud) often is given the name MiludT. Similarly one born near the Feast of Abraham (^cId al-Kabir) will often be known as al-KabTr. If an earlier child has died, the later child may be given the same name or a name indicating that he or she is a replacement. A child may also be named after an admired person among his immediate relatives who has recently died. Naming a child after a living person is considered an ill omen for the child in Morocco and is therefore not done. There are fashions in naming, and names often acquire a political significance. In earlier generations almost all male names were religiously based (in a pattern reminiscent of that described by Goitein, many female names were not). A name once given is not ordinarily changed, although in some regions such as the Sultanate of Oman a man or woman may change his or her personal name at marriage if the name is thought to be incompatible with that of the proposed spouse. In such contexts, each letter of the alphabet is thought to be correlated with certain values (such as fire and water), some of which are incompatible with others. If the names of a couple intending marriage lack the proper correspondence, then the name of one of the two is changed,[173]

Nicknames can be acquired for a number of reasons. Usually they refer to a distinctive personal characteristic, or an incident in a person’s life which stands out. A Moroccan in one small town was named “Bin Shaqrun,” after a prominent Casablanca merchant of the 1890s, because he used to sell things as a child to other children in his quarter. In a Jordanian village, one man is called al-Hamshan, a Turkish word meaning countryman, because his father served in the Ottoman army in the First World War. Upon returning to his village he greeted the first man he saw with: “How are you, hamshart'l” using the Turkish term. Another man known for his piety was called al-Shihadi (“Testifier” of faith in God), because a male child was born to him at the end of his life.[174] Nicknames easily fall into two categories. Those of persons

and groups that convey either neutral or positive images tend to be public and used in the face of the persons involved. Names conveying less desirable invidious personal characteristics, such as dagger (“busybody”), can be used as effective means of social control in the contexts of everyday use.[175] There is an inherent ambiguity in many such terms which permits them to be used either pejoratively or simply as signs of intimacy. One Moroccan secondary student is called al-muqayhir (“the down-and-out”) because, unlike his classmates, he ostentatiously dresses in his oldest clothing. The same nickname might be applied of course to a student who really was in desperate financial circumstances.

Names derived from occupation, origin, and affiliation (for. instance with a religious brotherhood) are called nisba-s, “ a combination morphological, grammatical, and semantic process which consists of transforming a noun into what we would call a relative adjective, but what for Arabs becomes just another sort of noun.”[176] Thus the location with which people are identified Can become part of their name: al-MarrakshT for a man and al-Marrakshiya for a woman who comes from Marrakesh. Depending on context, the same people can be referred to by the name of a quarter in Marrakesh, or by the name of a tribe in the region or subgroup of it, or by the name of a larger geographical or social entity. For example, in Cairo, Hasan al-MarrakshT might be known as Hasan the Maghribi (“the Moroccan”); in Morocco itself such a nisba would be hardly distinctive, nor would be al-Marrakshi’ln Marrakesh. Nisba-s also can be derived from occupations, such as al-Khayyafi (“the tailor”) and al-Baqqafi (“the grocer”); from affiliation with a religious brotherhood, for example, an-Nasiri for a member of the Na$iriya brotherhood; and from the name of a maraboutic descent group such as ash- Sharqawi (of the Sharqawl patronymic association); or ^cAlawl from the son-in-law of the Prophet (and thus indicating prophetic descent). The characterization of a person by nisba is highly flexible: “Calling a man a Sefroui is like calling him a San Franciscan; it classifies him but it doesn’t type him; it places him without portraying him.”[177] Combined with other types of naming and situating persons in social contexts, it provides one more means by which notions of self can be specified and expressed.

Patrifiliative names, such as Abu Bakr bin Fu’ad (Abu Bakr, son of Fu’ad), situates persons in the social context of their familial predecessors and elder contemporaries. In ordinary usage, the name of only one ascending generation is indicated, although for clarity or to emphasize particular features of one’s genealogy, a string of claimed predecessors may be added, as in Abu Bakr bin Fu’ad bin Driss, in which the grandfather’s name is also added, Occasionally, a mother’s name is added ,as a sort of nickname, especially in the case of plural marriages. Occasionally a matriflliative link is also indicated, as in Fafimabint Zahra (Fatima, daughter of Zahra). Children and young adults are commonly referred to only as someone’s child, as in Bint Hasan (Hasan’s daughter), until with maturity their own social identity becomes distinct.

Teknonyms, in which people are known after the name of their children, are also common: Abu Nasir (Nadir’s father), Abu ^cUmar, and Umm Muhammad (Muhammad’s mother) are examples of this usage. There are variations within and between regions in the

use of such names, with their use being more prevalent in the Levant and the Arabian peninsula, for example, than in North Africa. Among some nomadic tribes in Oman, for instance, a man can be given a teknonym based on his daughter’s name, although among the settled population of the coast and in the Jabal Akhdar region, a teknonym is based inevitably upon the name of a son.

One of the principal ideological features of patrifiliative name-chains is that while ideally they can be extended infinitely into the past, in reality they rarely extend further back than two generations. When someone asserts that such a namechain can be traced over many generations, it usually indicates the assertion of high social status, “noble” antecedents, or descent from the Prophet Muhammad. Middle Easterners sometimes claim that even elaborate genealogies are “real,” which in a certain sense they of course are, although the social base of such claims becomes apparent when it is noted that the most assiduously elaborated genealogical claims are associated with political, religious, and social leadership. [178]

Until fairly recent times, the use of family names, or kunya-s, was largely confined to members of the elite in many Middle Eastern countries. In Morocco such names became obligatory only in the 1950s and are still known in rural areas and small towns as “government” names. Sometimes family names were chosen for individuals from printed lists of available names, if the person did not suggest one. Some illiterates in fact have to ask other persons to read their “government” names for them, so little are these names a part of ordinary social contexts. Often names that can be thought of as nisba-s, such as SharqawT, are adopted as family names, and names connoting place of origin and of occupation imperceptibly merge with those of family.

As a basis of social identity, names primarily signify the actual person carrying the name, not abstract groups or genealogical “lines” with an extended temporal reality. The very structure of possible ways of naming a person ensures that the temporal depth is markedly attenuated, as is the notion of the person having a . fixed social location. Naming patterns and how they are used thus indicate that there is a considerable flexibility in how persons are identified and can choose to identify themselves. In American and European contexts there is also a certain flexibility: The terms of address used with persons, such as the use of the first name without titles or honorifics, can suggest intimacy or disrespect, according to context and the speaker. The same is true of course in Middle Eastern situations, but the fact remains that the variety of means by which a person can be identified is considerably greater.

*** Women, Men, and Sexuality

Some of the recent writings on women and sex roles in the Middle East assert that these subjects were neglected in earlier studies. Yet Roxann Van Dusen, the author of a

comprehensive review of Middle Eastern women's studies, has pointed out that it is not so much that women have been neglected in earlier studies, it is rather that portrayals of them have been unidimensional. For instance, analyses of marriage and domestic life have concentrated principally upon formal roles and procedures. In community studies, women were generally described as "a world apart," or as inhabitants of a "private" sphere of limited "social" significance. In a number of studies, even those concerning family planning and population patterns, there is similarly a significant but incidental coverage of women. Recent literature concentrates explicitly upon such topics as women's economic roles, patterns of friendship and visiting, and the role of women in rituals and in mediating disputes.[179] After criticizing the noncumulative nature of much of the recent research on women and women's roles, Van Dusen suggests that more substantial analytical work can be achieved through intraregional comparisons and, even more importantly, comparisons among social strata. Her specific suggestions are to concentrate upon differences of age and generation, patterns of residence (urban and rural), length of time in various locales, and education and its relation to family background. She also suggests the need to conduct comparisons over time and to develop a more critical attitude toward some of the more common themes which run through the past literature on Middle Eastern women: the significance of the public/private dichotomy, male distrust of female sexuality and its implications, women's selfimages and patterns of socialization, family interactions, economic roles, and political roles.[180]

Since the appearance of Van Dusen's review, two major collections of essays have appeared which substantially answer these questions and indicate the contribution that the study of women and sex roles can make to the central concerns of social theory.[181] I emphasize the potential contribution of such studies rather than what has been realized to date for the reason that most of the research discussed here has appeared very recently and with few exceptions has been in the form of articles rather than full monographs. For this reason it has been difficult for scholars concerned with such topics as sexuality and the role of women to take substantial account of one another's work. The following discussion is thus necessarily confined to assessing the resources upon which more comprehensive discussions can be elaborated and made to contribute to the main currents of social thought.

Anthropological knowledge has a way of calling into question the most fundamental assumptions concerning "human nature" and the assumption that there are two gender roles is no exception. Based on research in Suhar, a town in the northern coastal region of the Sultanate of Oman, Unni Wikan asserts that in the case of this particular region of Oman there are three and not two genders: man, woman, and khanith. A khanith in Oman is a male transsexual prostitute. Wikan argues that such prostitutes are defined by "a socially acknowledged role pattern whereby a person acts and is classified as if he/she were a person of the opposite sex for a number of crucial purposes."[182] Such a statement in itself suggests a variety of role patterns, but not the existence of three genders. In the article, j however, Wikan argues that whereas women are always women on the basis of their

: anatomical features, for men it is their role in the sexual act and not possession of

the appropriate sexual organs that is constitutive of gender.[17] She claims that the

; existence of this “third sex” in the Omani context is a means of protecting the vir- tue of women, for the “third sex” can act as a safety valve for men’s sexual drives.[18] Moreover, Wikan states that members of the Omani “third sex” can | redefine their identity simply by marrying and acting as men and can shift back 1 and forth in how they represent their gender in public because each individual in

[Oman “is his own master”; the world is recognized as imperfect, so that men

i! strive to criticize the actions of others as little as possible unless it directly affects I their interests. As several critics of Wikan’s argument have pointed out, her discussion rests upon a confusion of cultural definitions of gender and of sex roles. These critics offered alternative explanations which do not invoke claims to the existence of a third gender but instead examine the social roles of male transsexual prostitutes. Wikan’s discussion is clearly argued, but many of its key assumptions are flawed. Thus in logically eliminating all possibilities of men’s seeking sexual “release” in forms other than male prostitutes, she argues that masturbation is discouraged in part because of the “Islamic fear” of polluting the right hand.[19] (Surely use of the left hand could overcome such a “fear”?) And the implicit Quranic injunction against homosexuality contained in the story of Lot (Sura 26, verse 165) surely can also be considered “Islamic” and be used to neutralize the normative base on which this element of Wikan’s argument rests. Despite the faulty construction of Wikan’s discussion, its presentation and subsequent discussion have served to clarify numerous issues concerning sexuality. The article remains one of the relatively few extensive discussions of the values underlying prostitution in the Middle East'(as opposed to its mere incidence) and their relation to notions of person and sexuality.[20]

Apart from Wikan’s discussion, most studies concerning sex roles in the Middle East point to the markedly different patterns of socialization of the two sexes. As already indicated, the different types of names which tend to be given to boys and to girls strongly suggest the different attitudes toward the two sexes and their roles in society. Ammar’s discussion of childhood socialization in an Egyptian . village remains one of the best available accounts and is a significant point of

'’’ibid, 309.

[19] Wikan, “Man Becomes Woman," 315.

[20] The following letters concerning Wikan’s argument have been published: Gill Shepherd, “Transsexualism in Oman,” Man (N.S.), 13, no. 1 (March 1978), 133-34; Robert Brain, “Transsexualism in Oman?” Man (N.S.), 13, no. 2 (June 1978), 322-23; Gill Shepherd, G. Feuerstein, and S'. al-Marzooq, with a reply by Unni Wikan, "The Omani Xanith," Man (N.S.), 13, no. 4 (December 1978), 662-71; and Unni Wikan, “The Omani Xanith-. A Third Gender Role,”Man (N.S.), 13, no. 3 (September 1978), 473-76. departure. Boys, he writes, tend to be regarded as a capital investment in peasant settings and a greater contribution to the social prestige of the family. A man with a number of sons is thought to be able to speak with more authority as the sons mature. Consequently, midwives are given more substantial presents on the birth of a boy than that of a girl. Ammar indicates the lesser enthusiasm which greets the birth of a girl, yet points out that normatively It is reprehensible (makruh) formally to evince dissatisfaction at their birth. Villagers are frequently reminded of the pre-Islamic custom of burying female infants alive and of Islam’s superiority in this regard as the Quran forbade the practice. Nonetheless, villagers say they regard girls as burdensome and a potential source of shame to the family,, so that girls must be carefully protected until their marriage. [21] Ammar lists what villagers consider to be some of the positive attributes of women, such as greater compassion than men are supposed to possess, yet the structure of his account clearly indicates the greater reserve that tends to accompany the birth of women. A practical index of attitudes toward the two sexes might be the infant mortality rates of female as opposed to male infants. The claim is made for Iran that the female infant mortality rate is higher than that for boys.[22] Although Ammar provides detailed statistics concerning overall infant mortality rates—but without regard for sex differences— and such detailed data as the relation between divorce and the number of surviving children, he says only that the family treatment of infants is more protective and more attentive compared with the later period of childhood.[23]

In the village studied by Ammar, girls are shown comparative indulgence in infancy but are expected to reach “sociological adulthood” more rapidly than boys. They soon form separate play groups and are differentially treated throughout their childhood and young adulthood. Perhaps' the most striking experience that the two sexes undergo is circumcision, which is practiced on both sexes in the Aswan region of Egypt. For boys, this occurs between the ages of three and six and is accompanied by a public communal celebration involving both adult male relatives and friends and a separate meal for women. Girls are circumcised (that is, the internal labia are cut off) at the age of seven or eight, ostensibly “to prevent any suspicion on the bridegroom’s part that the bride is not a virgin.” While the occasion of male circumcision is regarded as a religious occasion, that of female circumcision is confined to women, and men are not even supposed to evince an interest in it.[24] On reading Ammar’s account, it is easy to concur with Paul Vieille’s

il

Ammar, Growing Up, p. 113.

[2i] Ibld., pp. 116-18. Despite legislation prohibiting female circumcision in Egypt enacted in 1959, the practice continues in some areas. See Nikki R. Keddie, “Problems in the Study of Middle Eastern Women,” International Journal of Middle East. Studies, 10, no. 2 (May 1979), 240. An even more radical practice—infibulation—occurs despite legislation forbidding it in the Sudan and certain other Middle Eastern countries. Inflbulation involves the deliberate mutilation of the female genitalia so as to close off the vaginal opening almost completely. It is an statement concerning the status of women in Iran that the “progressive devaluation” of women is apparent despite the value placed upon their fertility and their importance as counters of exchange in “good” marriages.[183] When a girl is married at the average age of twelve or thirteen, despite the legal requirement that she be sixteen, as reported by Ammar, or on the average between the ages of thirteen and fifteen, as the Gulicks report for Isfahan, Iran, clearly she has only a minimal say in her fate.[185]

As with, other topics of key concern in a region so vast as the Middle East, it is important to consider how such practices fit in with other key social assumptions. Singling out a single attribute of local custom, such as the practice of veiling (in any case not a specifically Islamic practice despite popular assumptions to the contrary), often turns out to be relatively unimportant in comparison to overall patterns of sexual ideology and practice.[186]

The need to examine comprehensively the obligations, rights, and division of labor of both sexes is a main theme of Emrys Peters, who undertook a comparison of women in four different Middle Eastern settings.[187] Among the Bedouin of Cyrenaica, he states that there is little separation of the sexes until girls are nubile; there then follows a pattern of strict control and arranged marriages. After marriage, the formality of male-female interaction decreases somewhat, with men managing the “external” affairs of the household and women managing the domestic side. Women generally agree to renounce their inheritance rights at marriage, but at’ the same time after marriage acquire a certain amount of political status. Wives do not own tents, as is the case with other Bedouin societies including

the Al Murra of Saudi Arabia, but their bridewealth includes a number of furnishings for the tent for which women possess full rights of inheritance.

In the ShT^cT peasant village of south Lebanon studied by Peters, he found that women of higher status (the “Learned Families” discussed in Chapter 3) were veiled their entire lives and confined in their practical activities. In contrast, peasant women wore only head scarves and could move about with relative freedom. Among higher-status families, marriages were carefully arranged within their own circles; among peasants, there was a freer range of choice, and many marriages were love matches. Women inherited, and for peasants the world of men and women often was interchangeable. In contrast to women in Bedouin society, however, peasant women in Lebanon tended to have a low political status.

The two remaining comparisons that Peters makes are with recently settled Bedouin who replaced the Italians as olive farmers in Libya and Maronite Christian women in Lebanon. In the Libyan case, Peters argues that the ethos of sexual segregation was transferred to settled life. But whereas women in the semidesert had freedom of movement within camps, in the settled situation this freedom shrank to the house itself, isolating women and diminishing their status “to the point of degradation.”[59] In the case of the Maronites, the impact of male emigration was an Important consideration, as women often could assume significant political roles if left to manage households on their own for long periods of time; as with Muslim peasant women in Lebanon, personal and familial compatibility is a serious consideration in marriage and there is a latitude of individual choice.

Peters’s observation that the status of the two sexes is strongly correlated with the division of labor is echoed in many writings on the implications of sex roles in the Middle East. For this reason a number of studies have concentrated on the impact of greater educational opportunities for women, legislative reforms, and the effect of changing economic and political conditions upon women’s roles and the image of women in society. In countries such as Egypt and Turkey, some women of the middle and upper classes participate in organized movements for the explicit purpose of ameliorating the status of women, and such associations exist today with varying degrees of influence in most of the countries of the Middle East.[188] A notable exception is Saudi Arabia, where among other restrictions women are not allowed to drive, are not allowed to attend university classes with men, and are allowed access to library facilities only at specified and highly limited hours when no men are present.

Legal reforms which have benefited women to varying degrees have been enacted in most Middle Eastern settings, with substantial improvements in the status of women in countries such as Tunisia, Iran, and Turkey.[190] There are notable omissions in such reforms. Only Turkey, Israel, Tunisia, and the Soviet Union have, for instance, prohibited polygamy altogether, although in other countries, including Iraq and Pakistan, specific legal permission

must be obtained for marriages subsequent to the first marriage. In Morocco and Lebanon, women can insert restrictions into marriage contracts against husbands taking second wives.[191] Minimum ages for marriage are in effect in most Middle Eastern countries, and reforms limiting a husband’s unrestricted ability to divorce have been enacted in most countries. Laws related to inheritance, on the other hand, have met with greater resistance because of the existence of specific Quranic prescriptions. Of course, legal reforms in themselves do not necessarily change social practice, although they may reflect the changing values of legislators or rulers. In Turkey, which introduced fully secular civil and criminal codes in 1926, marriages in rural areas are often never officially validated by civil courts, and inheritance disputes tend to be settled independently of the formal judicial system.[192] Nonetheless, a recent study indicates a gradually increasing assertiveness by women over the last two decades in using the court system when they are involved in disputes with men. The consequences of legal reforms affecting women have emerged only gradually, but their social impact is now becoming apparent and is tied to the current higher educational level and greater political sophistication of women.[193]

The status of women in revolutionary situations is more difficult to determine. Women in the regions of heavy Muslim population in the Soviet Union appear to be the only ones to enjoy equal legal rights and educational opportunities. Revolutionary countries such as the People’s Democratic Republic of South Yemen and liberation movements throughout the Arab world often proclaim the full equality of women with men, but actual practice is virtually impossible to assess.[33] No clear pattern has yet emerged from the Iranian revolution of 1978-1979, but the participation of Iranian women in political life, educational opportunities, and the exercise of legal rights enacted on their behalf by the regime of the last Shah are now being held up to question. During Algeria’s struggle for independence, some women participated fully in the revolutionary movement. Because the French rarely searched them, women often were used for carrying bombs and as couriers. Since independence, however, women have continued to be treated as minors, have had lesser de facto access to education, and have been discouraged by public policy from competing with men in the labor market.[36]

Access to education is a prerequisite in many ways for a change in women’s status throughout the region. In the Middle East as a whole during the 1960s the average percentage of adult women (fifteen and over) who were literate was only 13 percent, ranging from a low of 4 percent for Algeria, Libya, and Morocco to a high of 30 percent for Turkey.[37] Of course, the higher proportion of school-age girls in primary schools as of the early 1970s as opposed to earlier decades indicates the capability and commitment of particular countries to provide for women’s education, yet popular resistance to the inclusion of women in mass literacy

campaigns (as in Afghanistan) suggests an unwillingness to reconsider the traditional forms of male domination. Enrollment rates vary from 83 percent of school-age girls in primary schools in Tunisia, constituting 55 percent of total enrollment, to the respective figures of 36 percent and 33 percent for Morocco, 50 percent and 29 percent for Iraq, 61 percent and 41 percent for Turkey, 85 percent and 43 percent for Jordan, to less enviable records of 18 percent and 28 percent for oil-rich Saudi Arabia, 21 percent and 33 percent for the Sudan, and 1 percent and 2 percent for the Yemen Arab. Republic.[195] In every case there are significant regional disparities, with the percentage of rural women having access to education markedly lower than urban women in every instance and the proportion of women remaining in school after the age of fifteen dropping very rapidly as compared to the proportion of men .

Most studies suggest that the higher the direct involvement of women in nondomestic economic activities, the more open the social roles they can perform. At the same time, recent intensive studies of the economic role of women have documented a greater traditional and nontraditional range of roles that women can occupy than has often previously been reported. Davis reports a total of twenty- two different income-earning activities engaged in by rural Moroccan women. Some of these can result in increased social status; others, such as field labor and prostitution, result in a decrease.[196] Adopting a more global perspective, Maher presents a complex picture of categories of women in Moroccan society and how recent economic transformations have affected their status. These include women of “high bourgeois” origin who have been able to use their status and access to higher education to win a considerable measure of political and social autonomy; “new women,” educated women of the “petty bourgeoisie,” who have assumed professional roles as teachers, nurses, and secretaries; dependent wives of upwardly mobile petty administrators and teachers, for whom a rise in social status usually means a strict seclusion from men and the organization of activities in time and space so that the social worlds of men and women rarely coincide; “free” women— professional dancers, some divorced women, some wives of migrant workers, and prostitutes—often of rural origin, who trade off their ambiguous status for autonomy from the male tutelage;[197] and women who because of their precarious economic situation—widowed, divorced, kinless, or with husbands unable to work—' are forced into factory work and other work considered as socially marginal.[198] Fatima Mernissi’s interviews with women working in various craft industries such as weaving textiles and rugs indicate how dependent women are upon men as intermediaries, a

situation that only increases their precarious economic position. She concludes that the increasing capitalist penetration of such industries has had the consequence of further degrading women's status.[199] As Maher points out, the progressive impoverishment of the Moroccan countryside with recent economic transformations has had "particularly devasting" consequences for women and children, as a result of their subordination to men and their exclusion from the labor market.[200]

Similar conclusions have been drawn elsewhere in the Middle East: Whether it is the replacement of camels by trucks in nomadic encampments, or more complex economic processes, the most dramatic changes in women's status appear linked to economic transformations.[201] Michael Fischer's analysis of the changing situation of women in Iran might be taken as a general guide for most of the region. He writes that in Iran there has been a conservative ideology which allocates women a subordinate status to men. Until recently this ideology had its base in "small- scale peasant and merchant communities."[202] As this economic-political base has undergone radical transformations, the conservative ideology concerning malefemale roles has increasingly been eroded. Changes in state ideology favoring women's suffrage, the admission of women to all levels of education, legal enfranchisement, and access to public employment all have, served further to call into question traditional assumptions concerning women's roles.

How the erosion of this conservative ideology will be resolved is a matter open to debate. Economic "modernization" has just as often brought a worsening of women's practical status as an improvement in it. Nonetheless, economic transformations have in almost every instance brought the traditional ideologies concerning male-female relations into question. Even when changes in the status of women appear to move at a glacial pace, women in remote rural areas are increasingly aware of the opportunities available to them and are beginning to question the roles assigned to them in the past or by prevailing conventional ideological assumptions. As one colleague has suggested, the general lack of participation of Muslim women in public life in the past means that when they assume modern professional roles, they experience fewer obstacles to their careers than has been the case until recently for women in the United States.[203] While this observation certainly holds in the case of professionals in countries such as Egypt, no one has demonstrated a "trickle effect" upon the status of women with less extraordinary qualifications or upon their ability to participate in public life in government and commerce.

Change in the status and roles available to women is not a process confined to recent times or to major social upheavals such as the advent of Islam in seventhcentury Arabia or nineteenth- and twentieth-century European domination of many parts of the Middle East. Additionally, the ideological conventions concerning women vary considerably in different Middle Eastern societies. To ignore these differences of time, place, and social condition in order to speak of a pervasive "Islamic attitude" concerning sex roles leads to serious distortion.[204] In the West, use of a term such as "the Christian woman" would immediately signal a partisan conception not clearly related to specific historical or social contexts. Yet precisely this sort of transhistorical abstraction is commonly used in writing about women and sex roles in the Middle East, both by outsiders to the region and by those living within it.

One cause for the contributing popularity of such ahistorical abstractions comes from the way that both those advocating maintenance of the status quo and those advocating a rethinking of sex roles, like other significant aspects of social identity and social policy, seek legitimacy for their views. Revolutionaries, modernists, and traditionalists all assert that their positions are identified with the “authentic” message of the Quran and of Islam. Thus, those who wish to emphasize the constraints which Islam places upon women in society emphasize Quranic verses such as the following:

Your women are a tillage for you; so come unto your tillage as you wish.

(Sura 2, verse 223)

Men are the managers of the affairs of women for that God has preferred in bounty one of them over another . ..

And those, you fear may be rebellious admonish; banish them to their couches, and beat them.

(Sura 4, verse 3S)[205]

Taken in a literal sense, as do many conservative Muslims, such verses can be used to legitimize the effective relegation of women to an inferior status in public life and in relations with men. However, it is equally possible to read these verses in a more liberal sense by emphasizing the contexts in which these verses occur: legal prescriptions which specified the rights of women and frequently improved upon existing customs at the time they were revealed in seventh-century Arabia. The verse following the second of the above quotations, for instance, recommends that if a husband and wife should quarrel, arbiters should be appointed from the kin of each to seek a resolution of the conflict. Moreover, through various judicial and customary interpretations of Islamic doctrine, considerable modifications of doctrine and practice can occur despite the fact that the authors of such changes legitimate them by claiming that no change is involved other than a “return” to pure Islamic principles. Unfortunately, the ideological claim that no change occurs has blocked some analysts from perceiving variations which are often dramatic.

One of the earlier approaches to the study of sex roles in Islamic society was to signal the disparity between what was considered to be the “Great Tradition”—a distillation of what was taken to be Islamic law and Quranic ethics—and locally elaborated practices and traditions as studied by anthropologists throughout the Islamic world. When the study of sex

roles and ethics is conceived of in terms of transcultural norms and local comportment, the anthropologist then sees various village practices as “accommodations” of what is taken to be the normative tradition of Islam to the exigencies of village and urban life. The first studies of this kind to appear, notably Antoun’s essential 1968 article concerning the “modesty” of Arab village women, performed the valuable service of assembling relevant Quranic citations and aspects of Islamic tradition, of culling appropriate ethnographic sources, and of reporting on his own meticulous Jordanian research.[206] The principal drawback to this approach is the somewhat artificial normative tradition against which local practices are assessed. Muslim intellectuals ranging from Saudi fundamentalists to liberal modernists each construe a particular Islamic tradition and measure contemporary practices and expectations against it. Antoun’s attention to translocal norms (as locally understood) and locally accepted practices is useful. Yet by asserting that there is an identifiable Islamic normative “tradition” somehow independent of particular situations and carriers, anthropologists who study the “problem” of accommodation tend to ignore the continuing debate among Muslims as to just what is normative and arbitrarily select one normative construct against which actual practice can be measured.

Another major approach to the study of women in society is what can be called the structuralist approach, perhaps best exemplified by the writings of Pierre Bourdieu on the Kabyle Berbers of Algeria. Bourdieu situates his discussion of women in the broader context of issues of honor and a wide range of social relations. As he writes, honor “is the basis of the moral code of an individual who sees himself always through the eyes of others, who has need of others for his existence, because the image he has of himself is indistinguishable from that presented to him by other people.”[50] Hence the dynamics of honor necessarily involve those of social exchange in general. When speaking of dishonor in Kabyle society, the formulas employed generally refer to how certain problems appear before others. Social honor in general, he argues, is maintained through a series of challenges and ripostes. Kabyles distinguish between two complementary forms of honor: nif (a term which literally means “nose”) and hurma (“all that is prohibited under the penalty of committing sin, or is sacred”).[51] Bourdieu translates hurma as “honor” and nif as “point of honor.” Hurma implies both that which is sacred and that which is respectable. The integrity of honor requires a “punctilious and active vigilance” of the point of honor (mf). At times, matters of points of honor can be manipulated as in a game of two parties seeking to outbid the other, but any challenge to honor deals with the “most fundamental divisions” of Kabyle culture, “those which control the whole mythico-ritual system.”[52] Bourdieu proceeds to identify hurma with all that concerns femininity, the “sacred of the left hand,” sexuality, food, magic, and privacy, while he identifies nif with the sacred of the right hand, masculinity, all which concerns social and political exchanges, religion, and public life.[53] The propriety of women and the privacy of the family is thus for Bourdieu a crucial component of the broader discussion of the implications of the role of women and sex roles. Indeed, in a complementary essay he links the architecture of the traditional Kabyle house, the practical functions associated with each of its sections and its cultural connotations with a series of dualistic categories (male/female; house/fields and market; day/night; upper/lower; right/left) which make the house a microcosm of “the same oppositions which govern all the universe.”[54] Women and sex roles in this view are components of a more

comprehensive set of cultural assumptions concerning the world that are shared by persons in a given society.

A broadly analogous approach is the intensive analysis of specific rituals as a means of eliciting attitudes toward sexual differentiation. This type of study is perhaps best exemplified by John Mason's analysis of wedding rituals in a Libyan oasis community. His analysis suggests the confluence of three opposing forces, a principal one being the generalized assumption of female inferiority, in which male honor and the "kinship group requirement of protecting female virtue (via the modesty code)" are opposed to women's assumed "ethical incapability of controlling [their] animalistic sexual appetite [s]."[207] As with Bourdieu's structuralist approach to the study of honor, Mason refers to the changes taking place in Libyan society and their impact upon sex roles, but these observations do not figure into his structural analysis as such.

A more comprehensive approach to the study of sexuality and sex roles is exemplified by the work of Lawrence Rosen. For Rosen, members of a single society may share "a broad set of cultural assumptions [yet] may nevertheless possess diverse interpretations of reality."[208] One such set of assumptions concerns the nature of sexuality and sex roles; although, as he argues, the possession of such common assumptions does not necessarily imply that both sexes will elaborate their shared assumptions in quite the same way. After reviewing the essential features of male and female roles in Morocco—the markedly separate patterns of socialization for boys and girls, the expectation that women are predominantly confined to domestic roles, a differential access to resources in which women in general are economically more insecure—Rosen graphically depicts some of the assumptions which Moroccans make concerning how men and women differ as persons.

The essential contrast which Rosen draws is between the complementary concepts of nafs (“passion, appetite”) and ^cqdl (“reason”).[209] Nafs is possessed by all living creatures—angels, men, animals, and jnun (sing.,/mn-s). It is composed of all the passions and lusts; unchecked it can lead men to do bad and shameful things. ^cQal is “reason, rationality, the ability to use our heads in order to keep our passions from getting hold of us and controlling us.”[210] Through following God’s word as it is known from the Quran and the teachings of Islam, man can avoid being a slave to his passions, can distinguish right from wrong, and can live as God intended man to live. Through discipline and learning, a child learns gradually to control his passions. Women also possess reason but cannot develop it as fully as men have the ability to do. “It’s just in their nature. Women have very great sexual desires and that’s why a man is always necessary to control them, to keep them from creating all sorts of disorder. ... ‘A woman by herself is like a Turkish bath without water,’ because she is always hot and without a man she has no way to slake the fire.”[211]

As Rosen points out, the notion that women are subordinate to men is an ideological assumption shared by both sexes, but in practice it is elaborated in different ways by men and women. Men tend to emphasize the supposedly natural differences between the two sexes when they seek to “comprehend their actual ties with women” and how they ought to handle concrete situations regarding them. Women, for their part, tend more to emphasize the social relations of the two sexes and “ways in which men can be ignored, outflanked, or outwitted by the arrangement of various social pressures within the household or family.”[212] In short, their actions suggest that they regard their subordination as more social than natural. Rosen proceeds then to document how the definition of what is “reality” is negotiated in crucial situations such as marriage negotiations.

The advantage of the analytical approach exemplified by Rosen is that no implicit assumption is made that the “nature” of social reality is fixed and derived from rules. Both the cultural assumptions concerning reality and their articulation in practical social circumstances are regarded as subject to redefinition through changing political and economic circumstances.

Michael Fischer employs a similar approach in the study of Persian women, although he places greater emphasis on the circumstances engendering social and cultural change than does Rosen.[213] Paul Vieille, also concerned with Iran, seeks to depict attitudes concerning sexuality in peasant society and does so by tracing the interrelationships among virginity as a female “capital,” fecundity, and the comple- . mentarity of the sexes (with women considered to be “incomplete,” submissive, and inferior). He writes that in peasant society, “sex is ... a constant subject of dreaming, of preoccupation, of conversation” and goes so far as to say that Iranian peasant society is “a society centered on sexuality.” Yet he proceeds to depict sexual practice as remarkably contrary to-the ideal. He writes that the only contact in

the course of the sexual act is between the genital organs; caresses are virtually unknown (despite there being no specific religious or cultural prohibitions); there is no communication between spouses regarding the sexual act; and the “avowal of pleasure is inconceivable from woman to man and also from man to woman.” Even in married life the woman must refrain from showing her desire; deficiencies such as sterility are almost always attributed to the woman. In sum, and perhaps with hyperbole, Vieille writes: “Comradeship or friendship among men and women is inconceivable and cannot exist; all verbal communication and all physical approaches take on sexual content and are suspect.” A woman is “a sexual good at the disposition of a man,” yet as Vieille implies, assumptions concerning sexuality suggest a “contradiction” between the level of institutional values, where sex is overrated, and that of actual sexual practice.[214]

Although Vieille’s essay makes an attempt to treat sexuality comprehensively by speaking of male-female relations and other forms of sexual gratification, he is not entirely successful. He writes that the laments of popular songs and “the frequency of other forms of sexuality such as masturbation, homosexuality, and bestiality” all suggest a masculine dissatisfaction with heterosexual relations despite the lack of “direct indexes” of what men think.[215] Here Vieille reiterates what might be labeled the underlying “hydraulic” theory of sexuality, in which any impediment to heterosexual relations is thought to result directly in the practice of other forms of sexual gratification.

When explicitly stated as above, the deficiencies of “hydraulic” theories of sexuality can easily be recognized. The liberalism of some European countries and parts of the United States has not demonstrably resulted in any shift between homosexual and heterosexual orientations and, if anything, has resulted in a more tolerant attitude toward what Vieille would call “other” forms of sexual gratification. As suggested thus far in this chapter, ideologies of sexuality involve complex dimensions, including notions of domination, authority, intimacy, friendship, economic hegemony, and other essential definitions of, and practical control over, self and social honor.

Nonetheless, or possibly because sexuality in the Middle East as elsewhere is such a crucial component of notions of self, it is difficult to elaborate a more comprehensive discussion of the issue because of the lack of a solid base on which to build. So little reliable discussion has taken place to date in the scholarly literature on the Middle East that Burton’s “Terminal Essay” to his translation of 1001 Nights—an encyclopedic inventory of hearsay and what he considered to be the sexual wonders and extravagances of the “Sotadic Zone” (a region which for him stretched from Tokyo to Tangier, his “Orient”)—is astonishingly referred to even today as authoritative in some general books on the region.[216] Most discussions of sexual conduct make cursory references to male and female homosexuality and other forms of sex, as when Snouck Hurgronje wrote of nineteenth-century Mecca that there were many men “who gave themselves up, to the vice called after Lot” and their female counterparts as well.[217] The “Orient” writ large was used as a screen against which Western images of its supposed excesses could be projected. Pilgrimages such as that made by Andre Gide in 1893 to Algeria in search of the “golden fleece” of moral and sexual

liberation only served to reinforce the Western notion of the “Orient” as different and exotic, in sexuality as in other spheres.[218]

Such images persist in the travel literature of the present, as when Gavin Maxwell suggests that the marsh Arabs of southern Iraq “are not very selective in their direction of sexual outlet; all is, so to speak, grist to their mill.”[219] With sexuality treated superficially as the exotic, it is not surprising that even nineteenth-century ethnographers such as Snouck Hurgronje noted that Middle Easterners, especially educated ones, spoke with circumspection concerning sexual attitudes and beliefs. As ethnography, isolated comments such as those I have cited above only underscore how little is known of sexuality in theory or conduct.[220]

A sketch of what a comprehensive study of sexuality should be and an indication at least of the documentary sources on which it could be built is provided by the Tunisian sociologist, Abdelwahab Bouhdiba. His La Sexualitken Islam (Sexuality in Islam) analyzes attitudes toward sexuality in the medieval Islamic world and in the contemporary period both through texts and (by reference to a few relevant colonial and contemporary studies of Tunisia alone) sociological accounts. He insists that although the Islamic community considers itself rightly as a unity, Islam is fundamentally “plastic” in its essence, so that nothing of the ambiguities of existence or of life are “sacrificed,” including the serious and playful, collective and individual components of sexuality. For Bouhdiba, one can speak of a Malay Islam, an Arab Islam, and Iranian Islam, a Tunisian Islam, and other Islams, each of which suggests essential comportments and attitudes which cannot be reduced to “folklore.”[221] His text is resplendent with suggestions of how the sexual dimension of identity has been elaborated in the context of various expressions of Islamic belief and practice and a multiplicity of social structures.

*** Ethnicity and Cultural Identity

Ethnicity is no less complex a notion than the other aspects of personal and cultural identity so far considered. In a provocative essay written in the late 1960s, Fredrick Barth briefly reviews the drawbacks to defining ethnicity in terms of shared biological features and, as he understands the term, cultural identities and suggests instead that analytically the crucial elements of any definition of ethnic group are those characteristics “presumptively” determined by origin and background, which actors use “to categorize themselves and others for purposes of interaction.”[222]

When Barth’s discussion of ethnicity first appeared, it provided a useful corrective to those discussions which either took ethnicity to be a fixed and unchanging element of personal identity or which regarded the notion of culture as composed of set, prescriptive “traits” or rules. However, most modern anthropological notions of culture emphasize how cultural meanings are socially employed, produced, and maintained in social action and interaction.

The social production of meaning is a component of such an approach to the study of culture.[223] Barth sought to consider the “socially effective” to the exclusion of all considerations of cultural meaning, except insofar as notions of ethnic group identity produced or maintained perceptions of boundaries of groups, as opposed to what he called “cultural stuff,” which he saw as merely content filling in social form.[224] As this essay has reiterated in various contexts, the notion of culture as “stuff’ is not analytically useful.

FIGURE 7-2 Shabak men, northern Iraq. (Courtesy Amal Rassam.)

As logically elegant as Barth’s essay is in some respects, it is limited in theoretical value because it lacks an adequate notion of how social processes are related to the production of cultural conceptions with which people distinguish themselves from “other” ethnic categories and with which they account for, evaluate, and weigh the importance of those distinctions. Instead, Barth focuses upon the organizational forms of social groups whose principle of unity is presumed rather than demonstrated to be that of ethnicity rather than alternate or complementary attributes which could form the base of organizational cohesiveness. For example, the essay concerning Fur cultivators and Baggara pastoralists in the Sudan explicitly avoids consideration of the historical process of personal shifts of ethnic identity between the two groups. It is explicitly assumed that when persons change the means by which they utilize certain resources, their ethnic identities change as well. Even were this to be the case, little attention is paid to precisely what ethnicity means in the setting of the Fur and the Baggara and, indeed, only Fur views of social identity are provided in any detail.[225]

An analytic framework which presented the principles of ethnic stereotyping (notions concerning the motivations of the members of “other” ethnic groups and what can be expected of them) of both groups and how these notions were maintained in changing historical contexts would have been much more useful.[226] In his own case study in the volume, Barth is concerned with elaborating the economic and productive contexts in which it is useful for Pathans to stress their identities as Pathans and when it is not. By confining his discussion to “traditional” Pathans, and to social groups distinguished by their exploitation of particular ecological “niches,” some of the most significant tests of the precise ramifications of ethnicity in contemporary and complex settings are ignored.[227]

The identity of the Shabak of northern Iraq as studied by Amal Rassam (Vinogradov) gives some notion of just how complex ethnic identities can become and why it is misleading to study them as if such identities were part of a fixed ethnic “mosaic.”[228] The Shabak are a Muslim Shi[0] ! sect of about fifteen thousand persons located in some thirty-five villages to the east of Mosul. The area in which they live is fairly delimited, they speak a Kurdish dialect (with most men today bilingual in Arabic), and until recently they worked as sharecroppers on land owned by a group of wealthy Arab families who live in Mosul and who claim descent from the Prophet. In recent land reforms the Shabak have become landowners themselves. They largely marry only among themselves and tend to be secretive toward outsiders with

respect to their religious beliefs. In the immediate vicinity of the Shabak are a variety of ethnolinguistic communities: ShI^cT Turkoman tribes in villages along the Tigris, ShI^cT Kurds, Sunni Muslim Arabs in Mosul, Christian villagers (Monophysites, Assyrians, and Nestorians), Jews in both Mosul and in agricultural communities (until 1958), Kurdish-speaking gypsies, and tribally organized Sunni Arabic-speaking Bedouin.[77]

Rassam writes that “the Shabak are completely ignorant of their history and cultural affiliations” yet states that an analysis of what is known of them historically is essential to consider their self-identity and how it is changing. The Shabak claim that their name derives from an Arabic term, shabaka, which means “to interweave” or “to tie together,” and thus alludes to the fact that they are an amalgam of peoples.[78] Unlike other groups in the Mosul region, the Shabak “claim no common descent and keep no genealogies; neither do they have lineages which provide political leadership.” Their social integration is provided almost exclusively by their religious beliefs and practices. As Rassam writes, the very weakness bf the Shabak protected them. They made no claims to social honor on the basis of corporate strength, which indeed they did not possess, and they carried no weapons. “Thus, they avoided any involvement in the kaleidoscope of political alliances and feuds that raged around them.”[79]

At the same time, the Shabak were in a patron-client relation with their landlords (the soda), a relation that continues today despite the fact that the patrons are now their former landlords, as the land has been expropriated and distributed to the tenants. Similarly, there was nothing inevitable about the sada, as the descendants of the Prophet are collectively known, acquiring their favored position. The Ottoman administration in the nineteenth century settled five families of sada in the Mosul region in order to use their religious prestige and influence to buttress their authority. In return for their cooperation as representatives of the state and

Society: Religious Alignments in the Hindu Kush. Anthropological Papers, 50 (Ann Arbor: University of Michigan Museum of Anthropology, 1973). A later series of short papers on the same theme is contained in Ethnic Processes and Intergroup Relations in Contemporary Afghanistan, eds. Jon W. Anderson and Richard F. Strand, Afghanistan Council, Occasional Paper 15 (New York: Asia Society, 1978). Anderson’s “Introduction and Overview,” pp. 1-8, is particularly useful in suggesting the limitations of using the notion of ethnicity in non- Westem contexts.

^Ibid., 210.

Change in Practical Ideologies: Self, Sexuality, and Ethnicity 161 as intermediaries charged with keeping the population of the region peaceful and politically inactive, the Ottoman government gave the sada families large tracts of land. As landlords of the Shabak, the sada gave their peasants a place to stay when they came into Mosul to sell their produce and buy provisions, and “acted throughout as advisors, creditors, and protectors” on their behalf.[80]

Under the conditions of relative insecurity that prevailed under the Ottoman administration, the Shabak had few alternatives to being sharecroppers; a few individuals managed to acquire funds (for example, by working for the British army in Iraq in the 1920s) to buy lands themselves and to become upwardly mobile, one sign of which was to speak Arabic exclusively and to adopt urban life styles. Some even claimed sada status for themselves, and all sought to downplay their former identity as Shabak. In post-1958 Iraq, with the consequences of land reform and rural education having a major impact on social and cultural identity, Shabak can emigrate to other regions of Iraq or leave their villages to work in nearby factories.[81] As Rassam insists, it is not sufficient to define the Shabak in the context of locally existing ethnic groups and to locate them in time and space: “Equally important is to discover the basis of their differential access to resources, religious, social or economic, and the patterns of their articulation ... an historical analysis becomes crucial for the proper assessment of the factors involved in the formation of these groups.”[82] A sociological comprehension of ethnicity necessitates a historical understanding of how ethnic identities articulate and are manipulated.

The situation depicted for northern Iraq is not dissimilar to the ethnic complexity of neighboring countries, notably Turkey and Iran, both of which contain minority populations which differentiate themselves according to ethnic, religious, and linguistic criteria. Perhaps the most complex country of the region in terms of such identities is Lebanon. The country was on the verge of civil war several times in the 1950s and 1960s prior to the tragic conflagration which began in 1975. Often the fighting is simplistically reported in the foreign press as between “rightists” and “leftists” or between Christians and Muslims. Actually the situation is considerably more complex. By 1975, Lebanon, a country roughly the size of Connecticut but only thirty-five miles wide, had an estimated population of three million, with seventeen officially recognized religious sects. Because Lebanese electoral politics were linked to the strength of the various sects as recorded in the official census, there had been no official census since 1932. Nonetheless, most accounts assume that 30 percent of the population was Maronite Christian, 20 percent Sunni Muslim, 18 percent ShI^cT Muslim, 10 percent Greek Orthodox Christian, 6 percent Greek Catholic, 6 percent Druze, 5 percent Armenian Orthodox (many of whom arrived as refugees from Turkey in the early part

of this century), with the remaining 5 percent of the population divided among Armenian Catholics, Protes-

[82] Rassam (Vinogradov), “Power,” pp. 157-58.

tants, Jacobites, Syrian Catholics, Syrian Orthodox, Nestorians, Latin Rite Catholics, Jews, and others. An estimated one-third of Lebanon’s inhabitants as of 1975 were noncitizens. These included 500,000 Syrians (both Christian and Muslim) and an estimated 300,000 Palestinians (again both Christian and Muslim). Although earlier immigrants to Lebanon, including Armenians and many of the Palestinian refugees who arrived in 1948 were accorded Lebanese citizenship, most of the later arrivals were not. Joseph estimates that 60 to 75 percent of Lebanon’s population lives in cities, with over 50 percent of the urban population being in the greater Beirut area.[229] As the fighting in Lebanon’s south continues, the refugee population of the capital has increased, further exacerbating the various potential cleavages in Lebanon’s society. Furthermore, distances in Lebanon are so short that incidents in one part of the country immediately affect other parts.

Although Lebanon’s civil war is characterized as sectarian, this notion must be carefully analyzed. Khuri’s enumeration of sectarian differences between a predominantly Maronite region of Beirut and a neighboring ShI^cT one indicate that there are considerable differences of education, occupation, marriage and household patterns, life styles, and other nonreligious identifying features between the various sectarian groups.[230] For example, Christians tended to have contact with European missionaries from the nineteenth century onward and have benefited from educational facilities superior to those available to most Shi^ca. Such educational differences explain in part the marked occupational differentiation between the two confessional groups, with the ShT^ca tending to be concentrated in professions which can be acquired by apprenticeship or which require no specialized training.[231] Although neighborhoods are not distinguishable by class, there has been a marked settlement by sect, but the geographical and social boundaries between Muslim and Christian communities (and various divisions within them) are not always sharp. In general, areas of concentration of one sect tend to serve as a magnet for other persons of the same sect. As Khuri writes—in a study completed prior to the 1975 civil war—“interaction between confessional groups is, by and large, limited to business transactions and to formal occasions: festivals, weddings, and funerals. To interact openly and freely with other confessions requires both knowledge and

hypocrisy: knowledge of the etiquette, manners, and cultural sensitivities of the other group; hypocrisy in pretending to appreciate the ways of others while manipulating them."[232]

Joseph emphasizes in her writings on sectarianism in Lebanon that the boundary markers between various sects have varied historically and that the sects should not, even under present circumstances, be taken as fixed religious and political identities.[233] Her study of Burj Hammud, an independent municipality about 5 kilometers from downtown Beirut, clearly depicts the practical implications of sectarian identity.

Like other parts of Lebanon, population movements in and out of Burj Hammud reflect the political and economic currents affecting the entire country. In 1920, the municipality had a population of 2,000 persons, which increased to 20,000 in 1942 and to about 200,000 in 1973, with a high population turnover. Every one of Lebanon's 17 major confessional groups is represented in its population.[234] Less than 1 percent of its present-day population is composed of the original settlers of the town.

Joseph stresses the importance of the period when various waves of migrants settled in the community, a factor which Khuri also mentions. The first major wave of migrants were- the Armenians who came to Lebanon following the massacres in Turkey in 1920. Through the assistance of various Armenian organizations, they bought land in the region and encouraged other migrants to join them. Through the end of the Second World War the Armenians predominated numerically in the region, set up a number of small industries, and built schools, clinics, clubs, and churches. They likewise gained control of the municipal board and have retained that control to the present. Palestinians began arriving in the community after 1948, with the wealthier ones settling directly in the community and the more impoverished ones living in a nearby camp. Following political upheavals in Syria in the 1960s, a large number of Syrians, mostly Sunni Muslims but also of other Muslim and Christian confessional groups, arrived. Later refugees in the 1970s were largely Shl^ca from Lebanon's south. As a consequence, Joseph estimates that the present population distribution is roughly 40 percent Armenian Christians, 40 percent Shl^ca, and 20 percent Palestinian. Some of the municipality's neighborhoods are mixed in confessional orientation, but in most cases a single group predominates.

Several sorts of bonds emerge from daily interaction. Almost every street constitutes a neighborhood, with households of various confessional groups mixed together. Neighbors tended to share their various goods and to participate in each other's feast days and other special occasions. Women tended to form interconfessional friendship and visiting networks which often served as the basis for maintaining some semblance of security, social control, and unity in the street even in the face of deteriorating political conditions.[235] On the other hand, the sectarian identities and the armed militias maintained by the strongmen of

various groups have become increasingly part of the regular fabric of social life. Here the national (and international) repercussions of Lebanese “internal” politics become apparent. In Bug Hammud as elsewhere in the country, each confessional group can call upon its compatriots elsewhere. In fact, many of the Lebanese residents of Bug Hammud did not vote there when elections were held (one of the reasons that the Armenians maintained their local political strength) but in their villages of origin where they were indebted to particular strongmen (zzz^czm-s).

Similarly, groups that might be strong locally but weak nationally coalesce with others. Thus the right-wing Kata’ib party, whose principal base of support is the Maronite Christian community, usually tends to be supported by the Armenians, just as the Palestinians (both Christism and Muslim) tend to be supported by the Shl^ca of Lebanon’s south or refugees from that region. When any one group is threatened, it can call upon compatriots elsewhere to support its conceived interests.[236] These various armed militias are organized almost entirely along confessional lines, as Khuri points out in his comments upon patterns of political leadership in Lebanon. In fact, he goes so far as to say that ideological political parties, such as the Ba^cthists and Communists, appear to appeal primarily to the young, semieducated, and unmarried, many of whom desert these parties after marriage when they have more responsibilities and material interests to protect. Some alliances cross confessional lines, but these usually are among particular leaders.[237] Hence sectarian affiliations and the importance of asserting confessional identity can be more flexible than may at first be apparent.

Several researchers recently have questioned whether the strength of organizational forms along confessional lines is real or apparent and have placed great stress upon the relation of economic realities to political structure and notions of authority. Virtually all accounts of organized violence and political leadership in Lebanon acknowledge that the followings of various strongmen are primarily along sectarian and factional lines. However, Michael Gilsenan, among others, has argued that although sectarian politics of the “Boss Tweed” variety and their associated patron-client relationships were important in an earlier era in Lebanon, fundamental economic transformations have profoundly altered the structure of Lebanese society. One consequence is that despite appearances, there has been a cementing of ties among favor givers (Lebanon’s zzz^czm-s) irrespective of sectarian affiliations to the exclusion of all other Lebanese (the favor seekers), in order to keep the favor seekers dependent and to ensure that they continue to think of Lebanon’s politics as a spoils system in which only ties to successful strongmen can bring any semblance of security. This “alliance and consolidation at the top” suggests to Gilsenan that class conflict has become the root of current Lebanese political unrest, not locally held ideologies concerning how that society is divided.[238]

j Amal Rassam’s conclusion regarding the ethnic and sectarian divisions of

j northern Iraq might equally be applied to the situation in Lebanon: “Ethnicity and its attendant patronage system represented an organizational solution through i which weak, special-interest groups managed to protect their identities and insure their survival.”[93] As this argument stands, it is somewhat circular for what the

' identity of ethnicity “solved” organizationally were problems of economic and

! political advantage-seeking. Such identities lost their importance once economic

and political circumstances were significantly transformed. The same observation concerning ethnic and sectarian identity and advantage-seeking has been put forward for Lebanon, stating that the major divisions of Lebanese society since the first major capitalist penetration in the nineteenth century have been economic and not religious ones and that such divisions are tied to specific historical circumstances and an intraclass struggle among political leaders.[94] To the extent that such organized factional violence is supported by international political forces, such an argument gains credence. Lebanese political leaders have managed to obtain arms and money from a variety of external political sources, thus prolonging their own tenuous command over their following.

Any consideration of ethnic and factional alliances must look beyond purely local ideological beliefs to understand the particular forms they take. The Kurds are a case in point, and their situation serves in some ways to indicate the difficulties involved in treating ethnic identities as either primordial givens along the lines of Carleton Coon or merely as locally held “apparent” ideologies of identity a la Barth.[95]

Kurdistan is a region which crosses several international boundaries. The majority of Kurds are located in Turkey (7 to 12 million), Iran (4 to 6 million) and Iraq (2 to 3 million), with smaller numbers in the USSR (600,000 to 1 million) and Syria (500,000 to 600,000), and perhaps 400,000 elsewhere.[96] The number of

[95] The Kurds are very poorly known from specifically anthropological studies, as most ethnographers have spent only brief periods of several weeks to two months in Kurdistan and were not familiar with Kurdish or the other languages of the region. With these reservations, the principal studies are E. R. Leach, Social and Economic Organisation of the Rowanduz Kurds, London School of Economics, Monographs on Social Anthropology, 3 (London: Percy Lund, Humphries and Co., Ltd., 1940); Fredrik Baith, Principles of Social Organization in Southern Kurdistan, Universtetes Ethnografiske Museum Bulletin, 7 (Odo: University of Oslo, 1953); and Henny Harald Hansen, The Kurdish Woman’s Life: Field Research in a Muslim Society, Iraq, Nationalmuseets Skrifter, Etnografisk Raekke, 7 (Copenhagen: National Museum, 1961).

[96] Figures derived from “Kurds on the Move,” The Middle East (London), no. 55 (May 1979), 47-52, which provides a useful summary, of the political situation of Kurds today. Similar political ambiguities plague the substantial disparity between the population claims of Egyptian Coptic spokesmen (7 million) and official estimates (2,600,000 as of 1976). See Makram Samaan and Soheir Sukkary, “The Copts and Muslims of Egypt,” in Joseph and Pillsbury, Muslim-Christian Conflicts, p. 130.

Kurds is itself a significant political issue, with the Kurds themselves suggesting the upper figures and those wishing to diminish their political importance advocating the lower estimates. In Turkey, a recent survey of Kurdish affairs indicates that there has never been official discrimination against Kurds, who have provided prime ministers, millionaires and members of parliament to the country. There is, however, a cultural discrimination: The teaching and writing of Kurdish is banned, and younger Kurds advocating autonomy and independence are carefully watched by the police. There is evidence that the Soviets have encouraged the autonomy of Kurdish Turks (although presumably not of Kurds within the boundaries of the Soviet Union). In Iraq there has been sustained guerrilla warfare against the Baghdad regime, with arms and money supplied in part until 1975 through the Iranian and U.S. governments. One component of the 1978-1979 Iranian revolution was an uprising against garrisoned troops in an effort to gain regional autonomy and official recognition of their cultural and linguistic heritage.[239] Thus, ethnic and sectarian identities are forged and maintained in historically specific economic and political circumstances. As with a range of other attributes of identity, these ideologies have profound practical significance and are actively manipulated, often with requisite cynicism, for reasons of political or economic advantage.

Since ethnic and religious considerations are rarely if ever the sole attribute shared by persons and groups in the Middle East, it is crucial to consider how such social distinctions figure in the overall context of social and personal identity and not to stop at a mosaiclike’enumeration of distinctions such as ethnic group, sect, and occupation which indicate their complexity but which provide no, clear indication of what they mean in practice. An excellent analysis of such identities in a Moroccan context is provided by two complementary articles by Lawrence Rosen, one concerning the significance of “ethnic” distinctions between Arabs and Berbers, the other concerning Muslims and Jews.[240] Both articles deal with politically volatile aspects of cultural notions of self and community. The essential background is as follows. French colonial administrators, first in Algeria in the nineteenth century and subsequently in Morocco, sought to nurture a notion that “Berber” identity was distinct from that of “Arab and Muslim.” It was politically useful for the French to emphasize real and imagined differences of “Berbers” (largely residing in mountainous regions and in Morocco’s south) from the “Arab” society of the towns and agricultural plains, but this turned out to be politically disastrous in some respects. In 1930 the French issued their famous “Berber proclamation” in Morocco which legally excluded regions designated as Berber from the jurisdiction of Islamic law courts. The proclamation set off violent protests in all of Morocco, but nonetheless the French continued to treat the “Berbers” and “Arabs” as antagonistic to the end of their rule, implemented a number of policies regarding military recruitment, local administration, education (“Berbers” were forbidden to learn Arabic in schools, although most students found the means to do so anyway), which were designed to cultivate a distinctly “Berber” elite. The issue continues in many ways to be a delicate one for the present Moroccan government, many of whose French-educated administrators from the urban milieu, even if skeptical of The ideological justifications of French colonial policy, assimilated its basic assumptions concerning the structural divisions of Moroccan society."

Another major identifying axis in Moroccan society, as with other Middle Eastern societies, is that of Muslim and Jew. The Jewish community in Morocco remains one of the largest in the Middle East outside Israel itself, although significant Jewish minorities remain in other Middle Eastern countries as well.[241] A number of recent studies have suggested major cultural similarities between Moroccan Muslims and Jews. As Rosen writes, the status of Jews in the Middle East has historically differed significantly from the status of Jews in Europe and has in some ways been superior. Through the advent of French colonial rule in Morocco, Jews were scattered throughout the country. Many were in larger towns, where they often, but not always, lived in separate quarters called mallah-s', in many of the smaller centers-, regions of Jewish residence were not so sharply set off from their Muslim neighbors.[243] Jews practiced a range of occupations—they were butchers; sellers of charcoal, shoemakers, artisans in gold and silver, money-changers, grain traders, cloth merchants, and itinerant traders in rural regions.[244] Various European Jewish organizations made contact with Jews in Middle Eastern countries in the 1880s, and eventually the Europeans set up Jewish schools and community services of various sorts.

As a consequence of these early efforts and the provision of separate schools for Jews with the establishment of the French protectorate in Morocco, the Jews had a competitive edge in commerce, often serving as the local representatives for European commercial interests and as minor functionaries in the protectorate administration. By the 1930s, primary education

of a European sort became almost universally available to the Jewish community, while in the same period fewer than 2 percent of Moroccan Muslims had access to such education. After 1948 large numbers of Jews began to emigrate, especially from the smaller communities of the interior. A larger wave of emigration, however, began with Morocco's independence in 1956, with wealthier, educated Jews tending to emigrate to North America (especially French-speaking Quebec) and France and those with fewer skills or connections to Israel.

Even during periods of serious crisis, such as during the Second World War when the Vichy regime sought to deport Morocco's Jewish population and that of Tunisia, North African Jews were protected. Morocco's Sultan reminded the French that formerly Morocco was a sovereign nation and that Moroccan Jews were his subjects and had his full protection. The consequence was that Jews of French citizenship were vulnerable and were subject to deportation but not Moroccan Jewish nationals. The same protection of Jews by the Muslim population occurred in Tunisia, and as late as the 1973 Arab-Israeli war, many Moroccan Muslims took steps to ensure the safety of Jewish households with which they had ties.[245]

Now what does the tenor of Muslim-Jewish relations in Morocco have in common with Arab-Berber relations? Rosen's answer is first to indicate ways by which persons in any society can categorize others, using Alfred Schutz's familiar categories of predecessors, successors, consociates ("persons .. . who actually confront one another in intimate face-to-face relations"), and contemporaries (who do not actually confront one another directly but who have a "structural" relationship through stereotyped and anonymous roles).[246] Various cultures emphasize different types of relationships, and Rosen sketches some of the contrasts of Moroccan society, where there is a tendency for persons to seek to turn what Schutz calls ties with contemporaries into ties with consociates—that is, into total social relationships in which relationships with others are rendered stable and more or less predictable through the creation of multiple bonds of obligation. Other patterns predominate in cultures elsewhere, as in Bali where there is a tendency to turn personal relations into those of stereotyped anonymous contemporaries.[247]

Rosen writes that in Moroccan society in general (for "Berbers" as well as "Arabs" and for "Jews" as well as "Muslims"), personal obligations are not prescribed by kinship roles or any other roles. There is a wide, permissible latitude in how bonds, even of kinship, are expressed and a considerable flexibility in how an individual can "actually choose, or contract, particular kinds of relationships with his kinsmen just as, in the absence of strong sanctions to the contrary, he can contract such ties with outsiders.... Like ties of kinship, occupation, residence, and so on, inherent ties to other members of a particular ethnic division contribute to but do not wholly typify a given individual."[248]

Within this general framework the meaning of Berber identity becomes more apparent. Berbers are chiefly distinguished from other Moroccans by the fact that they speak a Berber dialect, but even this feature in itself says little of personal identity. Rosen then.proceeds to

consider patterns of occupation, residence, marriage, urban and rural origin, and other factors to show that distinctions in these areas do not coincide with languages spoken, as well as the modalities of political conduct and ordinary commercial transactions. His analysis bears out his assertion that Berber ethnicity is “only one among a series of factors operative in various situations, and that it serves as only one among a set of social identifiers.”[249] It provides a minimalist, baseline identity when nothing else is known of an individual, but even in the mundane activities of buying and selling, Moroccans immediately proceed to seek to make the bonds of obligations with other individuals more multiplex. In hardly any context is identity as Berber or Arab “an all- pervasive typification in terms of which one views and relates to another person.”[250]

FIGURE 7-3 Berber men and women. High Atlas region, Morocco. (Courtesy Robert A. Fernea.)

Muslim and Jewish relations in Morocco must be considered from the same overall basis in which Moroccans culturally typify most interpersonal ties. As is the case in the distinction between Berbers and Arabs, it is not possible to differentiate Jews and Muslims in terms of the economic roles they play. The major distinctions are instead between urban merchants and Jews on the one hand, with the distinctive social roles they play, and persons of rural and Berber-speaking origin on the other, although even this distinction is not a sharp one. Nor are Jewish traders, artisans, and merchants treated differently in the marketplace than other participants.[251] There is, however, an element of differentiation. Rosen argues that Muslims as a group share a “sociological pool” of “prestige resources” in which there is an intense and open competition among persons which ranges from economic transactions to political and marital ties. Jews in Morocco are placed outside this sociological pool according to Rosen in the sense that few marital ties are possible and their participation in politics is indirect and restrained. Relations of Jews with the Muslim community, both Arab and Berber, were more purely those of financial transactions, without the open-ended competitive ramifications engendered by more diffuse relations among Muslims. As with most other social ties in Moroccan society, those between Muslims and Jews were highly personal; in addition, however, they were noncompetitive in all but the economic sense. Thus a traditional role of Jews was to act as economic intermediaries between townsmen and the rural, tribalized population in central Morocco. Rosen writes that Arabs and Berbers (and Jews) did not risk their social independence. Often the resulting ties could even be characterized as those of friendship. Even with the transformation of Muslim-Jewish relationships which occurred with rapid identification of part of the Jewish community with European ways and economic interests in the colonial period, Jews continued to be treated as face-to-face consociates rather than as “stereotyped contemporaries.”[252]

Rosen’s account of how the meaning of ethnicity should be evaluated and of

FIGURE 7-4 Interior of synagogue, Tunisia, 1972. (Courtesy

Nicholas S. Hopkins.)

the relationship of ethnicity to other forms of social identity applies specifically to the Moroccan context, as ethnic (and sectarian) identity makes sense only when more fundamental and general Moroccan notions of collective identity are taken into account. Yet the strength of such an approach to the study of ethnic identity is in many ways independently confirmed elsewhere in the Middle East, notably by anthropological studies of the social and cultural context of “Oriental” Jews in Israel.

Briefly, here are some essential features of Israeli society as related to the situation of “Oriental” Jews, a term which I use here to designate Jews of North African or Middle Eastern origin, who emigrated to Israel or whose parents did so. Roughly half of Israel’s Jewish population (about 15 percent of the population is Christian and Muslim) consists of Oriental Jews. Because the majority of such immigrants had little educational background and possessed traditional skills that were of minimal use in Israel, they usually were compelled to become manual laborers and agricultural workers. This reduced status and the strong secularizing influence of Israeli society put severe strains upon them. As an aggregate, such immigrants and their children have considerably less success than their counterparts of European origin; their unemployment rates are significantly higher, the number of cabinet members and members of the Knesset (Parliament) is significantly less than their numbers in Israeli society. The same holds true for the number of Oriental Jews in the upper ranks of the military and in the civil service.[253] Israelis are aware of the aggregate disparities between Oriental and European Jews, but it is clear that they are the result of deliberate discrimination. Yet the perception of these relations among Israeli Jews themselves indicates a significant intercommunal problem. In a public opinion poll taken just after the 1967 Six Day War, 84 percent of Israelis thought that intercommunal relations were good; this figure had dropped to 48 percent by 1971,[254]

What does this situation mean for the perception of ethnic identity among Oriental Jews, especially those of North African origin? As one Israeli anthropologist, Shlomo Deshen, reports, Israel’s official immigration policies have been founded upon the notion of the absorption of refugee immigrants and encouraging them to think of themselves principally as Jews.[255] A common pattern has been that immigrants from North Africa at first tend to shed their traditional practices which mark them off from other Jews, but as they face the realities of adjustment in Israel they gradually resume some aspects of their particular identities, such as the publication of folktales and scholastic writings peculiar to their own communities, the support of particular immigrant associations, the production of unleavened bread (matzot) in forms unique to each of their communities, political support

for candidates concerned principally with the problem of immigrants of North African origin, and maintenance of “local” religious practices such as pilgrimages to Jewish saints (in a manner analogous to the visits to marabputic shrines among some of North Africa’s Muslim population). At the same time, the identities which these immigrants seek to project are not simply reconstitutions of identities which they possessed prior to their arrival in Israel. In fact, many immigrants who previously thought of themselves principally as Moroccan, Yemeni, Iraqi, or southern Tunisian Jews now think of themselves in terms of a new category of ethnic identity, that of Orientals. Deshen concludes that the immigrants “are making a stand for certain elements of their culture which they have retained and want to nurture. They seek to identify themselves also in autonomous subethnic terms, but they want that identification to be within the bonds of their overarching identity as Israelis.”[256] These symbolic transformations of the meaning of ethnicity are comprehensive in terms of the specific historical circumstances in which they operate. Ethnic identities forged in other, earlier contexts in Tunisia, Morocco, and elsewhere are the base from which subsequent transformations of these systems of meaning occur: “The derivation is there, even if continuity is most tenuous and subtle; and often it is quite overt.”[257]

Several conclusions can be drawn from the various studies of ethnic and sectarian identities discussed so far. First, ethnic identities, like linguistic, sectarian, national, family, and other forms of social definition can be comprehended only in the context of more general cultural assumptions made in a given society concerning the nature of the social world and social relationships. Sex roles, ethnicity, kinship and the like are all simultaneous components of social identity and cannot meaningfully be analyzed independently of more general shared underlying assumptions. Second, such identities must be analyzed in the specific historical contexts in which they are maintained, transformed, and reproduced, and not as blocklike units in an ahistorical mosaic. The theoretical points of departure of contemporary studies of ethnicity vary widely: from an emphasis primarily upon ethnicity as embedded in a system of social meanings (Rosen and Deshen) to ethnicity and sectarianism as principally a product of global economic and political circumstances (most of the contributors to the Joseph and Pillsbury volume). Nonetheless, the majority of the current studies recognize that research into notions of identity entails attention to both cultural meanings and the practical contexts in which they are produced. Anthropologists like other scholars concerned with social theory are not in a position to produce comprehensive schema for indicating the precise interrelationships between economic and political transformations and the ideologies of society and social identity maintained in them. But they recognize that both of these dimensions must be carefully analyzed and that systems of meaning cannot be treated as if they were unchanging, as they have been treated in the past and have sometimes been presumed to be in “native” ideologies. A final observation might be treated as a corollary to the above. Ethnic distinctions, like those of region, sect, sex, language, and even tribe, are not necessarily being erased, as an earlier generation of analysts once facilely assumed, but provide the base from which newer social distinctions are forged and maintained.[258] Even when there is a popular consensus or a desire among intellectual and political leaders to facilitate the reshaping of identities and responsibilities, be these in muting the importance of ethnic or sectarian identities or transforming the roles of women and men in society, the point of departure from which such transformations are made must be considered in assessing their direction and tenor.[259] Some governments and political leaders often seek to ease possible tensions that arise from making such group definitions by denying their

existence, but it would appear more reasonable to recognize them for what they are and constructively seek to harness them. Shared notions of community by ethnic group or region often can provide the basis of trust and solidarity necessary for effective functioning of and participation in modern industrial society.[260]

** 8. The Cultural Order of Complex Societies

*** World View

Institutions such as kinship, community, tribe, responsibility, and trust are subjectively held ideas about social relations shared by members of a society and embodied in rules, customs, symbolic actions such as ritual, and most everyday actions. Such patterns of meaning have been analyzed by some anthropologists as parts of formal systems of classification and symbol systems. For some purposes a formalist approach which is not concerned with social action is entirely legitimate. A complementary approach, emphasized throughout this book, focuses upon how meanings emerge, from a social practice.[261] Patterns of meaning are generated in the everyday world of social experience, shape that experience, and in turn are modified by it. This emphasis upon the production of meaning through practice (praxis in the vocabulary of some theorists) sets apart most contemporary analyses of world view (shared cultural assumptions concerning the nature of the social world) from those earlier studies that were primarily concerned with the “logical fit” among the key symbols of a cultural tradition. Notions of world view overlap with and build upon more specific conceptions such as family, community, ethnicity, and sexuality discussed in Chapters 5 through 7, but differ in that they are more explicitly integrative and comprehensive.

The idea that cultural meanings are socially produced has been introduced in the last few chapters through the discussion of specific topics such as tribe, kinship, the use of genealogies, sex roles, and ethnicity. I have stressed that these specific topics can be comprehended analytically only through the matrix of social definitions of reality through which everyday life and actions become subjectively meaningful to Middle Easterners themselves. The elaboration of concepts of world view in the Middle East, as opposed to how world views (or cosmologies, as many English anthropologists use the term) are represented in “primitive” societies, is in the context of historically known societies. The concepts which comprise particular systems of meaning, by being considered Islamic or otherwise universal, are not contained by the frontiers of any particular country, tribal group, or other social division. These concepts change historically in relation to the political and economic circumstances in which they are elaborated; any accounting of them must take account of the patterns in such variations.

As with any sociological study, prior approaches to the understanding of world view or, as it has often been called in the past, “national character,” must also be taken into account. In the past, the national character of a particular region was sometimes considered to be virtually unchanging. The attitudes and practices of Egyptian peasants of the twentieth century were thought to be nearly directly similar to those of Pharaonic times.[262] Such portraits of changelessness could be used to justify colonial domination. French colonial ethnographers drew upon those elements of European social thought which emphasized the fixed “primitive mentalities” of certain populations as one means of legitimizing the colonial enterprise. Handbooks prepared for European teachers of Moroccan children emphasized the fixed values and traditions of Moroccans, disregarding the impact of European domination and economic penetration. Such guides advised that “respect” for religious and social beliefs and practices required European teachers to limit what they conveyed to their students, so that education could not be used as a means of transforming what was conceived to be the “traditional” social hierarchy, the status of women, or other sensitive topics.[263] France’s “civilizing mission,” to use the phrase of the epoch, had its clear limits. Comparable accounts of “Oriental” character were prepared for areas under English colonial domination. As Edward Said and others rightly insist, the “mosaic” representations of Middle Eastern societies that deliberately avoid discussion of the impact of political and economic changes lend themselves readily to such assumptions, as do vague assertions concerning the “Arab mind” or “Islamic thought.”[264]

Contemporary anthropological discussions of world view are at once more ambitious and more limited in scope. They are more limited in that they do not assume that such representations are shared in quite the same way by all members of a given society, let alone from one end of the Arab and Middle Eastern world to the other. They do not purport to represent all implicit shared understandings, but only those most related to the comprehension of particular patterns of social action—the bazaar economy, kinship, participation in maraboutic (“saintly”) cults, friendship, and lying, to mention only the specific examples that will be elaborated in this and later chapters.

The more ambitious aspect of contemporary analyses of world view is that they seek to articulate those taken-for-granted attitudes and values that make everyday social action possible; social conventions that are so deeply rooted that they flow almost automatically. As Lloyd Fallers has written, an anthropologist interested in analyzing such basic assumptions must learn to cultivate

especially the receptive side of communication—the ability to spend most of one’s time listening instead of speaking, watching instead of acting; he learns to remember and to record in great detail what he sees and hears. These are difficult disciplines requiring rigorous training for academic intellectuals, who usually would rather talk than listen and who find boring or repulsive what they see as the “trivia” of ordinary life, particularly in their own societies.[265]

Taken together, such “trivia” documents a set of “natural” assumptions concerning the social world. These assumptions, which are felt to be “natural" and not “conventional,” are constructed and transformed through social practice and made up of everyday, incompletely systematized common-sense understandings of how the world “really" is.[266] Under ordinary conditions these basic assumptions form the implicit background against which social action is planned and carried out and are so taken for granted that they are not fully articulated by members of a society. Special frames of reference, such as formal religious ideologies, specialized knowledge of commerce and crafts, medicine, political strategies, and the interpretation of dreams, are elaborated against the background of such understandings.

Anthropologists have had different, albeit largely complementary, concerns in the elaboration of systems of world view. Some scholars have been particularly concerned with the logico -meaningful relations among the cultural assumptions which comprise particular world views. Others, while not neglecting this task, have paid particular attention to analyzing how such basic assumptions toward the social world are related to changing economic and political conditions. Because such implicit understandings are not fully systematized they cannot be represented as neatly organized “cognitive maps”; there is a meaningful fit among the assumptions which comprise particular world views, but the fit is best represented as jagged and uneven. In any case, what we hypothesize about any particular world view is documented by the fragmentary and often inconsistent outward actions and statements of persons in a given society . The ultimate test of an adequate description of world view, therefore, consists of its ability to render intelligible wide varieties of behavior in a given society. Many recent studies have sought to depict such matrices of cultural meaning and to place them in the context of historical and sociopolitical change. An assessment of the basic approaches used in the study of world view serves to tie together the discussion of the preceding three chapters and forms an essential backdrop to the discussion in later chapters of religion, politics, and the economy.

*** Morocco: God’s Will, Reason, and Obligation

Several anthropologists have used their various ethnographic studies of Morocco in the 1960s and early 1970s as a basis for exploring complementary aspects of the notions of world view and culture. Most of the resulting publications have also addressed wider issues, so they form a useful point of departure for discussing the theoretical significance of ideas of world view and their importance to the study of the Middle East.

A brief analysis of the relevant sections of my Moroccan Islam suggests some of the decisions facing an anthropologist in any discussion of world view. In that study, I sought to indicate the implicit set of cultural assumptions through which Moroccans make sense of the local interpretations of Islam and of transformations in these interpretations, especially over the last century. I worked with the initial assumption, shared for the most part with the participants in the study of Sefrou and its region—Clifford Geertz, Hildred

Geertz, Lawrence Rosen, and Paul Rabinow —that Morocco's social structure was best conceived with persons as its fundamental units, rather than their attributes or status as members of groups.[267] Moreover, persons are not arranged in layerlike strata or classes but are linked in dyadic bonds of subordination and domination which are characteristically dissolved and re-formed. The relatively stable element in this type of social structure is not the patterns that actual social relations form but the culturally accepted means by which persons contract and maintain dyadic bonds and obligations with one another.[268]

How is such an implicit notion of the social order made to appear natural and taken-for-granted to Moroccans themselves?[269] In a chapter entitled "Impermanence and Inequality: The Common-Sense Understanding of the Social Order," I sought to delineate five of the key concepts through which Moroccans comprehend social experience. These five concepts were God's will (qudrat Allah), reason (^cqal), propriety (hshumiya), obligation (haqq), and compulsion (^car).[270] The emphasis given to these five concepts rather than others was admittedly arbitrary in the sense that any description of world view is largely shaped by the range of social action that it attempts to render meaningful. Had my study concerned notions of sexuality rather than religious ideologies, for example, then emphasis would have been placed on other sets of Moroccan concepts that in my account were treated only in a subordinate fashion.

There is a problem of boundaries to these concepts in two senses. In the first sense, I deliberately used the term Moroccan rather than the name of the particular locale in which I worked, for my experience in research elsewhere in Morocco (and in trying out my formulations on interested Moroccans) suggested that with regional nuances, the same ideas applied elsewhere and in all likelihood did not stop abruptly at the country's frontiers. Indeed, many of the basic Moroccan assumptions concerning the social world are expressed in the form of Islamic ideas that are hardly unique to Morocco or to North Africa.

In the second sense of boundary, the concepts which comprise a world view are not in a fixed relation to one another. They are maintained insofar as they are actualized by individuals and meaningfully explain and render coherent action in the social world. When they cease to do so, they shift in emphasis. This flexibility accounts for their ability to accommodate and accounts for major shifts in the loci of economic and political power. Notions such as God's will and reason, for instance, have rich historical layers of meaning and are used elsewhere in the Muslim world. Both of the terms occur in the Quran and have been the subject of an interesting study of the world view of seventh-century Arabs, as well as an account of changing perceptions of the world in northern Sumatra.[271] The occurrence of these terms in Morocco is not unique, but they appear in a different semantic field, although in ordinary contexts most Moroccans never consider the possibility that these notions could be understood in any way but their own. Indeed, the fact that these implicit notions are tacitly construed by Moroccans as Islamic, as well as human universals, makes the resulting vision of the world all the more reasonable and compelling to them.

Let me briefly sketch how these key notions articulate with each other. God's will is a basic notion for Moroccans. Any expression of future actions or events is almost inevitably prefaced by saying "if God wills" (in sha' Allah), which is also tied to the notion of "that which is written" (maktub). French colonial ethnography glossed this notion as "Islamic fatalism," suggesting a Moroccan passivity and resignation toward the events of this world. This interpretation was congruent with the colonizing power's image of Moroccans but is almost exactly opposite to the way in which Moroccans themselves implicitly use the term. Let us consider the notions of social structure described earlier. For Moroccans, the inequality of men in this world is so matter-of-fact as not to be a matter of speculation. The actual state of affairs in this world at any moment is a manifestation of God's will; being inevitable, it cannot be questioned. An understanding of one's present social situation in terms of God's will legitimizes the momentary—and ephemeral—distribution of social honor as the God-given state of affairs. Men are free to take the world as it Is and to determine action on the basis of their empirical observations. God's will attenuates speculation on why particular projects succeed or fail and blocks metaphysical speculation on the fate of the individual in this world. The wide-awake, common-sense person is much more concerned with adjusting to circumstances as they arise than with considering how things might have been or should be. Pro- visionality, the acceptance of God's will, thus focuses attention upon assessing exact differentials of wealth, success, power, and social honor among particular men as a prelude to effective, specific social action, not upon speculation over the general order of the world. A corollary to this notion is that the responsibility of persons for one another is limited. There are abstract, normative obligations incumbent upon each Muslim, but how the obligations which arise from particular ties are valued varies significantly. Here is how one educated Moroccan explained to me the limits of one person's responsibility toward another:

God created differences among people. . .. Let people do as they want. God distinguishes between them. A Muslim's duty is just to show people the path to those who wish to be with God, and that is that. Either they take it or they leave it. The Prophets allow them the choice. There is paradise and there is hell, and God will select who goes to each.[272]

Linked to the notion of God's will is that of reason, a notion already introduced in the discussion of sexuality in Chapter 7. In Morocco and elsewhere in the Muslim world, the concept of reason is more explicitly tied to social context than is our own use of the term. Reason in the Moroccan context is primarily the capacity to discern the meanings of the actions of other people and, on the basis of such perceptions, to engage in effective social action. Reason signifies adroitness or cleverness (without the pejorative English connotations of these terms) more than a capacity for dealing with abstract rational phenomena. Its possession assumes a capacity to perceive the empirical ties between persons and to adapt them to one's own interests as best as possible, within the shared code of conduct of society. Reason enables a person to perceive what will pass as acceptable and approved conduct in the management of social obligations to kinsmen, neighbors, merchants, Clients, men of influence, and men without.

The word for reason, ^cqal, comes from an Arabic root which also means “confinement” or “control.” It implies an ability of persons to dominate their passions and to act as Muslims. Children are said not to possess reason because they do not yet know the Islamic law and code of conduct. Although Moroccans are highly affectionate toward their children, they say that at birth children are like animals, because only gradually do they acquire the code of conduct and the ability to abide by it that distinguishes them from animals. As children begin to participate in the fast of Ramadan and to assume adult patterns of comportment, they are attributed with reason. Similarly, as was pointed out in Chapter 7, reason is popularly considered to be more fully developed in men than in women. This is not due entirely to any innate masculine capacity but to the fact that women’s activities are confined primarily to the household and its immediate milieu. Hence a woman’s ability to engage in a wide range of social relations and to have full control over expression of her passions is considered to be less than that of a man. Some women are attributed a full capacity for reason, usually when high social class, education, or other circumstances enable them to participate effectively in the wider social world. One Moroccan explained the general difference between the sexes as follows:

A man will think. He sees a quarrel leading to [court]; he knows that the other man has more “pull” with the [court] than he does. He knows how to deal with people bigger and weaker than he is. A woman is light-headed. She doesn’t know how to do these things. If she goes to the [government offices], who pays attention to her? Better that she stay at home, where she can teach her daughters to cook and sew. They don’t know Islam like men do; they even have tricks to avoid fasting.[273]

In the same way that women are collectively considered to be deficient in reason, townsmen often claim that tribesmen are deficient because of their relative lack of skill in dealing with the government and merchants.

The notion of reason is clearly linked to the Islamic code of conduct in the complex symbolism associated with Ramadan, the month of fasting. The ability of Muslims to follow the arbitrary pattern of the fast and to refrain (among other restrictions upon appetites) from food and drink from dawn to dusk for one month each year is taken as a key metaphor by which men can discipline their desires in accordance with the arbitrary code of conduct laid down by God. Men’s capacity to follow the divine model reaffirms that they are not bound by their passions to live in a totally anarchic world. The five ritual daily prayers also symbolize the divine template for conduct, but Ramadan is recognized as a more intensive, sustained discipline of human nature and as an opportunity for the collective exercise of selfcontrol that signals the possession of reason.

Obligation (haqq) fits into the same pattern of comprehension of the social world. Men cannot control God’s allocation of success and prestige, but they can render the actions of others more predictable by contracting and maintaining bonds of obligation. In the Moroccan context all exchanges, invitations to meals, services as intermediaries, and even

offers of rides in a car are seen as obligations which must be reciprocated. Some obligations are minimally prescribed by Islamic law and “the way things are done,” such as certain obligations toward kinsmen and communal religious ties. These obligations can be fulfilled within a wide latitude of acceptable conduct. Even exchanges of greetings, with their complex code of gestures and manners, impose obligations, since they publicly assert what one person would like the other, and observers, to think regarding their relations.

If a person repeatedly asks for a service to be rendered but is incapable of reciprocating, then he falls into a client relationship with the other person. The dominant partner in the relationship is said to hold an “obligation over” (haqq ^cla) or “word” (kalma) over the other. The complex web of personally contracted bonds of obligation are always asymmetrical, just as all relationships impose obligations of calculable intensity. Exchanges of obligations can be very finely tuned. There is a carefully nuanced vocabulary for the discussion of gradations in them which depends upon a wide range of such factors as education, wealth, kinship ties, and networks of obligations held or thought to be held over others.

In general, the reasonable individual strives for flexibility in relations in which he is under obligation to others, while at the same time fixing as firmly as possible relations in which he holds obligations “over” other individuals. Since by God’s will the social world is viewed as in constant flux, an individual strives to be as free as possible to change the weight of obligations within his personal network, yet to remain within the bounds' of| propriety (hshumiya) or acceptable social conduct.

Compulsion (^car), the fifth of the concepts which I sketched in my original presentation, is a special sort of impossible obligation which provides culturally accepted means of mending serious breaks in the web of obligations which bind men together. Essentially, it involves such a profound public effacement of the person or group seeking to oblige another to act in a certain way or to restore ordinary social relations so that refusal to accede risks divine punishment and severe social disapproval. (For examples, see pp. 132-33 and 185-86.)

Taken as a group, all of these five concepts are logically articulated with one another and form a major part of the backdrop against which social relationships are elaborated. There is nothing fixed about these assumptions; some people question them some of the time, but most of the time they are accepted as an adequate and necessary base for daily social conduct and the assessment of the actions of others. These interrelated notions as a group cannot be extended to cover other societies in the Middle East; although, as previously mentioned, some of the concepts figure elsewhere in modified form and in different conceptual contexts.

*** North Africans in Israel

A particularly useful approach toward understanding how basic shared assumptions concerning the social world are modified is through the reanalysis of monographs concerning North African Jewish immigrants in Israel, a topic raised in a different context in Chapter 7. Israeli immigration policy has in many cases sought to “transplant” entire communities of North African Jews, so that villages in North Africa have been reconstituted in Israel and have clearly had to undergo rapid social and environmental change there.

An outstanding example of this genre of study is Moshe Shokeid’s The Dual Heritage.[274] As opposed to some of Shokeid’s later work, in which he is explicitly concerned with changing cultural values, The Dual Heritage is concerned primarily with social change, so some background is necessary to adapt his study to the present discussion of world view. Shokeid uses the sociological notion of reference situation, a complex of values appropriate to a past (or different) situation which continues to be used to discern social order in a novel context. The reference situation for the residents of the Israeli immigrant community he studied was their former village of some 350 persons, located in Morocco’s High Atlas mountains to the east of Marrakesh. To specify the nature of what he terms the reference situation, Shokeid attempts to reconstruct the social organization of this community as it once existed.[275]

For an anthropologist who has studied contemporary Muslim communities in North Africa, the reanalysis of Shokeid’s monograph is fascinating for what it reveals of similarities in shared notions of society between North African Muslim and Jewish communities. The Jewish community studied by Shokeid possessed a myth of how they came to be settled where they were in the High Atlas. He speculates that a quarrel may have led to the splitting apart in the nineteenth century of an earlier village. The event is recalled by the villagers in mythical form: A leading rabbi informed their ancestors not to emigrate to the new location until a fountain was discovered under a tree near the site where they later constructed their synagogue. An analogous type of settlement myth is told by Muslims in various parts of Morocco to account for the location of their villages.[276]

This particular North African Jewish village was surrounded by villages of Berber-speaking Muslims, and the social structure of the Jewish community appears to have significantly resembled that of their Muslim neighbors. Shokeid acknowledges that the memories of the past of the villagers now in Israel are somewhat idealized, so that their recollection of “permanent insecurity” is probably not quite accurate. However, the region was unquestionably insecure at the time of French entry into the area and later, at the announcement in late 1955 of Morocco’s imminent independence, there was a threat of renewed disorder which contributed to the departure of most of the community for Israel in 1956.[277]

Shokeid’s account of the internal differentiation of the community indicates that in the High Atlas mountains and later in Israel it was divided into patronymic groupings or agnatic

clusters, each claiming descent from a common ancestor, a pattern also common to rural and urban Muslims in Morocco.[278] He states that in Morocco these groupings were stratified, with the one possessing the most influential political and economic contacts on the top, skilled itinerant craftsmen next, and the unskilled at the bottom.

On arriving in Israel, the settlers were first assigned to a settlement called Yashuv, organized by one of Israel's leading socialist parties. The first settlement did not succeed for a number of reasons. Representatives of several of Israel's religious parties told the Moroccan settlers that their sponsors were antireligious, would compel their daughters to serve in the army where they would lose their virtue, and would not allow their sons to study the Torah. Additionally there were scandals concerning the allocation of wage labor which resulted in demonstrations and some violence. In 1957 a large number of the settlers moved to Romema, another settlement in the Negev, the principal locus of Shokeid's field study.[279]

According to Shokeid's account, the villagers from the three principal patronymic groupings saw themselves as a single cooperating entity upon their arrival in the Negev. Yet their intention of communal cooperation collapsed when they began to dispute over the allocation of leadership positions. Shokeid argues that the traditional hierarchical stratification of the three patronymic groupings in Morocco broke down in the new situation of the Negev, which was more conducive to egalitarian relations. In fact, by 1958-1959, Israeli settlement officials thought of writing off Romema as a failure and again moving some of the villagers, but by then it was difficult to shift immigrants to new locations.

In reading Shokeid's intricate description of the political maneuvers for land allocations and political office in Romema, I was struck repeatedly by the similarity of his account to those of my own and others describing contemporary local politics in Morocco.[280] The principal alliances were not necessarily along the lines of patronymic groups but along the lines of any available kinship or other form of relationship which could be used as the basis for concerted action.[281] Shokeid acknowledges that kinship relationships in themselves did not necessarily induce cooperation. Only when there were other social links or economic factors or common economic interests did cooperation actually occur.

Perhaps the best indication of the villagers' notion of community is their conception of,the committee which was organized to run their agricultural colony (moshav). The immigrants' use of Hebrew was admittedly imperfect, but the errors they made appear to have accurately reflected their conceptions. Shokeid explains that the proper way in Hebrew to refer to a member of the moshav governing committee was to call him haveir va'ad, "a member of the committee." The committee itself was va'ad. But the villagers consistently referred to this committee as va'adim, "committees," and to each committee member as va'ad, "a committee." The implication of this linguistic fact and of other documentation introduced by Shokeid was that each committee member in himself

represented a committee. Shokeid's conclusion is that each committee member, instead of drawing his status from the fact that he belonged to the committee, contributed his status to the committee. He documents this interpretation through a detailed analysis of how the committee handled the allocation of water during a shortage.[282]

The situation in Romema which Shokeid describes is congruent with the Moroccan notion of social structure in which the basic components of social structure are persons rather than groups and in which the stable cultural element is the means by which persons secure bonds with each other. One of his key examples is an incident in which a member of a lower-status patronymic association kissed the cheek of a higher-status group member on Yom Kippur in a gesture implying "humility and observance of the Jewish moral code." The gesture deprived the higher-status person of the opportunity to demonstrate his superiority through a public display of generosity and forgiveness. In fact, the upper-status man commented that the other man, "who had been his employee in Morocco, was now trying to lord it over him."[283] The entire incident, as with other incidents documented in Shokeid's account, easily makes sense in terms of the notions of obligation (and the constant renegotiation of social status implied by the manipulation of obligations) and the notion of compulsion as they are comprehended in the context of Morocco. Other accounts of immigrant communities of Moroccan origin in Israel, although not intended as analyses of underlying cultural assumptions, also imply similar background values.[284]

Let me suggest what I regard to be an appropriate reinterpretation of Shokeid's analytic framework, made possible by the quality of his ethnographic documentation. Shokeid concentrates upon idealized patterns of social interaction and tends in The Dual Heritage not to analyze underlying cultural values. Significantly, although he occasionally refers to past conflict and strife, he gives no elaborate examples of them. By juxtaposing an idealized past to a present in which the lines of conflict do not follow normative statements concerning the unity of patronymic groups, he concludes that the immigrants suffered a "breakdown" of their prior community.[285] I would alternatively argue that Shokeid's account demonstrates a marked continuity of values and of assumptions concerning interpersonal obligations, an interpretation supported by his passing remark in the conclusion that most Romemites were "fairly modem" in their economic comportment (and adaptation to political life in Israel), despite the fact that "on the whole, their value system hardly changed" and that the "new" forms of behavior were legitimized "within the traditional set of norms."[286]

*** The Market as a Cultural Form

A particularly intensive discussion of the economic dimension of cultural values is contained in a recent study of the bazaar (suq in Arabic) economy of a Moroccan town by Clifford Geertz.[287] The strategy of discussing economic activities as opposed to religious or political ones as a means of furthering cultural analysis is particularly appropriate

because some economists still treat economic activity as if it were isolable from cultural considerations. Geertz's intention is to sketch the bazaar as a theoretical notion implying certain processes as general as those associated with the ideal type of "industrial" and "primitive" economies. He concurrently treats the bazaar as a concrete institution situated in a particular cultural and historical setting.[28]

As a cross-cultural type, the bazaar economy possesses a number of distinctive characteristics that set it apart from other economic forms. Among them is the prevalence of small-scale enterprises with an intense division of labor, the lack of standardization of products, weights and measures, the preference for partnership agreements over employer-employee ones, the importance of negotiating skills (which predominate over managerial or technical ones), weak or informal government controls, the lack of hierarchical coordination of enterprises, the exploration of economic possibilities in depth with a few selected trading partners rather than a diversity of them, and the personal contract as the main form of legal relationship.[29] The information needed to function effectively in the bazaar is "generally poor, scarce, maldistributed, inefficiently communicated, and intensely valued."[30] The search for information is so important a characteristic of the bazaar that "a great deal of the way in which the bazaar is organized and functions .. . can be interpreted as either an attempt to reduce such ignorance for someone, increase it for someone, or defend someone against it."[31] Consequently the principal prob-

[31] Ibid., p. 125.

lem for participants in the bazaar economy "is not balancing options but finding out what they are."[288] Thus ignorance is a known (or known about) characteristic of the bazaar, not just a matter of some participants lacking certain information, and buyers and sellers are aware of this fact. Geertz emphasizes that these various characteristics of the bazaar are not random occurrences but imply each other and together form a coherent system.

Bazaar economies are found in a number of different social historical and cultural settings—Iranian, Moroccan, Chinese, Indonesian, and Mexican, to suggest only a few. Despite their overall similarity in some respects, Geertz's major argument is that there are equally important differences which make it imperative to comprehend each bazaar economy in its particular cultural setting. In the Moroccan case, his argument is that the bazaar is enmeshed in at least three key institutional frameworks. These are detailed in Geertz's presentation, so here it is necessary merely to suggest their wide scope. First is the involvement of the bazaar economy with the "ethniclike" distinctions of nisba identity, discussed in Chapter 7, in which a person can be referred to by a number of overlapping attributes of origin, craft, membership in a religious brotherhood, or other characteristics.[289]

Second is the association of the bazaar economy with popular Islam. One aspect of this association is the system of pious endowments (habus). Many urban shops are habus properties, whose revenues are used for various religious activities. The Ministry supervising these endowments is one of the town's largest landowners.[290] A principal benefit of these habus holdings to the trading community is that the rents for these properties are kept well below market value, largely because of the wishes of the trading community itself. Another aspect of the tiesbetween bazaar and Islam is that the practice of many crafts and trades is associated with participation in certain religious orders, and the fortunes of both appear to have prospered in the period of the late nineteenth and early twentieth centuries when the "region-focusing" bazaar economy in the town studied by Geertz began to crystallize and prosper.

A final consideration spelled out by Geertz was the role of the Jewish community in Sefrou in connecting the regional market of the town with local ones around it. Jews, many of whom were involved in commerce, constituted 40 percent of the Sefrou population toward the turn of the century. In the marketplace, as stated earlier, the activities of Jews were not distinguishable from those of Muslims. Yet there were two distinct roles played by Jewish participants in the trading community. One was to serve as intermediaries in the form of itinerant traders between Berber-speaking tribesmen of the Middle Atlas mountains and the Arab speakers of the plains. The other was for a few of the wealthier Jews both to control the marginal Jewish traders and to serve as sources of financing for the

FIGURE 8-2 Itinerant Jewish vendor of clothes and cloth goods (foreground) at market, Tunisia, 1972. (Courtesy Nicholas S. Hopkins.)

bazaar economy, 'before moving on to the economic opportunities later provided by association with "modern" European commerce in the period of the French protectorate. Geertz merely speculates on why Jews may have filled this intermediary role. He writes that part of the answer may have been their relative political impotence, meaning that their ambitions could be expected to be confined to the economic domain.[291] Geertz's

emphasis throughout is upon patterns of “fit” between institutional arrangements and their associated cultural values.

A final, and crucial, element of Geertz’s account involves study of the vocabulary used by Moroccans for speaking about and making sense of life in the bazaar. For Geertz, “the flow of words and the flow of values are not two things; they are two aspects of the same thing.”[292] Notions of “news,” “crowds,” “trust,” “friendship,” “validity,” “custom” and “convention,” “reason,” “understanding,” and other key terms are presented and analyzed as a means of invoking the “conceptual world” through which the activities of the bazaar are carried out.

In sketching the principal features of Geertz’s approach to the analysis of the Moroccan bazaar as cultural form, little has been said of the social historical context in which such activities take place. On the one hand, his ethnographic presentation documents historical transformations of the political and economic contexts in which the bazaar economy existed as meticulously as oral history and written sources allow. On the other hand, Geertz states that since 1900 “the cultural framework within which the homely business of buying and selling proceeds, the conceptual structure that gives it point and form, has altered but in detail.”[293]

FIGURE 8-3 "The flow of words and the flow of values are not two things; they are two aspects of the same thing." Market street, Mutrah, Sultanate of Oman. (Courtesy of the author.)

This may be so, but if indeed the “cultural framework” has remained so constant in the face of significant political and economic changes, then this is an important analytical insight of the nature of cultural values which deserves to be elaborated with the same intensity that Geertz applies to eliciting how the bazaar economy is comprehended and elaborated in the Moroccan context.[294] The silence of Geertz’s analysis concerning how systems of cultural ideas change notwithstanding, his study remains a major contribution to comprehending the web of cultural meanings through which trading and associated activities in Morocco are carried out and provides an important complement to his studies of other dimensions of the concept of culture.

*** Lying

The studies of world view considered so far in this chapter took the analysis of particular social institutions—Islam as popularly interpreted, community leadership, and the bazaar—as their point of departure. Gilsenan’s study of lying (kizb) in Lebanon takes a key cultural concept as his point of departure and indicates how it is tied to and produced by social interaction. He argues that lying is a fundamental element of specific situations and

individual actions which serves to restrict the social distribution of knowledge over time. Thus it is woven into the system of power and control present in any society. Its presence creates an uncertainty as to the precise degree of lying or truth present in a given situation.[295] The analogy with the “search for information” described by Geertz for Morocco’s bazaar economy and associated institutions is evident.

Gilsenan explains that kizb is an everyday word in Lebanon and that from childhood on persons invest a good deal of time in learning the sport of deceiving others. But the practice of kizb would be misconstrued if read merely as a negative value or as wordplay. A constant theme in Lebanese society is recognition of an essential tension between “appearance” and “reality.” Kizb possesses “its own aesthetic of baroque invention and is part of a style, of a wide range of variations on the cultural theme of appearance and reality, and is recognized at once [by Lebanese] for what it is.” Here Gilsenan’s approach indicates the anthropological rediscovery of how literature and the imagination are linked to cultural constructions of reality.[296]

Lebanese, writes Gilsenan, recognize that access to the true and real are through the Quran and the teachings of Islam, although men recognize that they spend much of their time ignoring it and actively lying. Echoing the phrase of Max Weber, he consequently sets out to document the “elective affinity” between the ideology of lying and social practice in northern Lebanon. He focuses upon the two domains of social honor and religious knowledge. In the domain of social honor, he first describes the social organization of Lebanese villages with the patterns of lords or strongmen (za^cim-s) and their followers. The normative code of social honor in Lebanon is public and uncompromising in its simplicity. In normative terms, the line between honor and dishonor is sharply drawn and prescribes direct, violent action in the case of offense. In practice, to preserve a reasonable balance of social order, Gilsenan argues that Lebanese invest considerable effort in creating ambiguities over how situations can be defined. The collective exercise of kizb manages to avoid confrontation by preserving the appearance that public honor is satisfied so that social life can go on. Those who persist in defining situations in terms of challenge and response threaten collective interests and consequently tend to be ignored or redefined as hotheads or “mad” so that their definition of events can be disregarded.[297] A parallel situation exists in the domain of religious knowledge, where the perception of who are real men of learning or miracle-producing shaykh-s depends upon the judgments and attributions made by relevant others as to who knows, or can discern the apparent from the true.[298]

Gilsenan’s discussion of lying, as with the other elaborations of Middle Eastern world views considered here, looks at complex social situations and the cultural values through which they are constructed. A particularly promising line of argument is his sustained attention to the practical elaboration of social meanings. In addition to evoking the “logical fit” between social action and meaning, he sets himself the ambitious task of at least pointing to the problem of what happens to meaning in circumstances of major political and economic change. He argues that the economic and political bases upon which traditional elaborations

of social honor were based have been undercut in recent years. As leaders have managed to purchase more and more land to consolidate their position and tie others to them, families have lost their autonomy, so that competition over honor reflects less and less the realities of power and social structure. “The cars, tractors, and harvesters that [younger men] drive and the guns that they carry belong to others, not to them.”[299] The ensuing notion of work becomes more a “false” consciousness which masks a situation that more and more persons consciously recognize. These matters are not just ones of style, Gilsenan concludes, for the “ultimate stake” is the definition of who you are, of self.[300]

*** Etiquette

In a practical sense, the best means of advancing discussion of the background conventions and assumptions that make possible the routines of daily life is through the analysis of concrete examples. It has been argued that each culture has at its core a set of common-sense assumptions about reality. These assumptions are usually not regarded as complete, but as sufficient to conduct the ordinary business of life. For this reason, turns of phrase, bodily movements, styles of dress, and patterns of etiquette are all valuable indicators of what these underlying assumptions are.

Within countries as complex as Lebanon, Iran, many of the Arab Gulf states, and Turkey, there is a recognizable diversity of personal and collective interests and beliefs, the commingling of which requires exercise of the virtues of civility, a collective self-restraint, and willingness to coexist with other persons and groups even if they do not share all basic assumptions about the conduct of daily affairs. Moreover, such basic assumptions are not fixed, and fortunately stereotyped metaphors such as “the Arab mind” and “the French mentality” are beginning to disappear from educated usage.

Still, it remains true that there are styles of social conduct indicating such background assumptions specific to particular cultural groups. Anyone who has conducted international negotiations realizes that one of their most difficult components is not what is formally said but the informal nuances of what is not said formally that figure significantly into the development of or lack of common trust necessary for satisfactory agreement. Gestures and complexes of beliefs form coherent rhetorical patterns. To take several obvious examples, for Americans (except New Yorkers?), normal conversational distance is about 3-4 feet apart, with closer distances corresponding to greater degrees of intimacy and greater ones suggesting more formality. Deans, business executives, ambassadors, and other high-status persons often have large desks not out of practical necessity but implicitly to modulate distance with visitors. Such functionaries usually also have couches and less formal seating arrangements (and hidden liquor cabinets) which can set an appropriate tone of lesser formality upon occasion and convey this informality by distance and setting. Among most Middle Easterners, by contrast, normal conversational distance is closer than 2-3 feet, a proximity at which many Americans begin to feel uncomfortable. Male friends or even relative strangers on good terms in the Middle East and Mediterranean will

frequently hold hands or touch during conversation, without such gestures conveying the sexual intimacy that they are often thought to convey in American contexts. Similarly, notions of time and how long a person can be kept waiting have cultural registers capable of subtle reading and orderly interpretation. Successful negotiators in international contexts tend to develop a flair for empirically comprehending such background assumptions; they may not possess the ability to articulate such assumptions, as is necessary for the anthropological analysis of them, but nonetheless acquire a practical mastery over them and over the delightfully complex problem of how these contrasting codes are practically intermingled.[301]

Older ethnographic accounts such as Lane’s Manners and Customs of the Modem Egyptians remain valuable for analyzing such assumptions. His discussions of greetings, for example, can be easily reinterpreted so that his model of a rigid social hierarchy determining the forms of Cairene society can be replaced by one which indicates more clearly the niceties of social rank and its public expression.[302]

A more recent study of the etiquette of guest houses (mudif-s) among the marsh dwellers of southern Iraq shows how rules for manners are closely related to social ranking and the Iraqi concept of person.[303] A few wealthy men have their own guest houses, but most are collective ones maintained by each lineage. These guest houses are the center for most male social life. Persons who attend the guest

FIGURE 8-4 Men of the "lower classes" (Lane's designation). (From Edward William Lane, An Account of the Manners and Customs of the Modern Egyptians [London: John Murray, Publishers, Ltd., 1860],p. 33.)

house are expected to attend fully dressed, with their head rope and outer cloak. One defers speaking before persons of higher status, and jokes and unnecessary laughter must be avoided in their presence. Even in the case of anger and major quarrels, those present are expected to speak clearly and calmly. Salim, the Iraqi ethnographer who has described the etiquette of guest houses, recounts that one day a man who had two quarreling sons ran to the headman of his lineage in the guest house and asked him to intervene. The man had entered with such great haste that he forgot his head rope and'was unable to speak clearly. The headman listened to him, then criticized him for speaking in a confused way, adding insultingly, “I thought one of your old wives had run away with a lover.” The underlying assumption is that in almost all social situations a respectable man is expected to show reason and self-control.[48]

FIGURE 8-5 Tribal guest house (mudif), southern Iraq. (From S. Ml. Salim, Marsh Dwellers of the Euphrates Delta [London: Athlone Press, 19621, plate 5A. Used by permission of the London School of Economics, the publisher, and Dr. S. M. Salim.)

Guest house etiquette in Iraq also clearly reveals relative social ranking. Each person sits in the place which corresponds to his social rank. High-status persons, such as descendants of the Prophet Muhammad, sit in places of honor, usually set off by carpets and pillows. The senior elder or owner of a guest house shows his respect to an esteemed visitor or stranger by personally leading him to his proper place or ordering tea to be prepared for him as well as the usual coffee. When a man enters a guest house, those assembled show their respect by rising to their feet for those of higher status and merely making the gesture of rising for those of lesser status. Then each person present greets the newcomer, who responds separately to each greeting, rising or making as if to rise as each case merits. Overestimating a person's social status makes a newcomer look ridiculous; underestimating it is tantamount to insult. The whole procedure can be quite complicated, and adult Iraqi males are expected to have mastered these complexities. The search for "information" as described by Clifford Geertz is hence an essential prerequisite for effective social comportment. Questions of rank are not explicitly discussed, but their accurate perception forms a necessary component of social life. If, because of long absence, a man is uncertain as to his relative rank, he will sit at a lower-ranking place and wait for someone to correct him.

*** Iran: Ta^caruf

Iranian social forms and etiquette provide a final and highly complex indication of how ideology and social institutions fit together and shape social reality. Iran, like other key Middle Eastern countries, has had generations of observers seeking to discern its central values in all-encompassing categories. A recent study sketches a tension for most Iranians between the opposing concepts of zerangi, which can be glossed as cleverness, shrewdness, insincerity, cynicism, and a lack of social responsibility, and safayi batin, a term which implies integrity and an inner piety. The first characteristics are regarded ideologically as necessary to deal with an uncertain and treacherous world, in which social relationships outside of a narrow circle are unstable and subject to rapid flux. The second term implies an "inner" self, reserved only for a narrow circle of trusted intimates, which is more pure, constant, and which approaches spiritual ideals. In many of the studies of Iranian "national character" reviewed by Ali Banuazizi, such brief sketches of value tended to become psychological profiles with "universal applicability" to all Persians and as such were untenable.[304] Later studies have sought to indicate how such notions inform and shape specific patterns of social practice and as such eliminate the assumption of fixity of earlier approaches.

A promising approach to the study of world view in complex societies is to analyze intensively the relation between conventions of social etiquette and social structure. This approach is particularly appropriate for Iran, where the conventions of etiquette (ta^aruf) are pervasive. In English, etiquette connotes prescribed routine, an unwritten code of honor, and a set of conventions to avoid lowering the dignity of persons or professions. In Iran, according to Beeman, the notion entails a discipline of the inner self in the service of the public self.[305] Only in the most superficial manner can etiquette be “read” as insincerity or the use of empty forms. Indeed, in Iran, knowledge of and use of ta^caruf (and of when to disregard its forms as well) appears linked to concepts analogous to reason as described for Morocco, in the sense that the possession of the “human refinements” of ta^camf are said to separate men from animals in Iran and those lacking such conduct are thought to be “childlike” regardless of their age or not in possession of their senses.[306] Thus the accurate use of etiquette can also be related to the control over and search for information described by Geertz in the context of the market and. Gilsenan in the social implications of lying. The elaborate codes of hospitality found throughout the Arab peninsula, North Africa, and elsewhere in the Middle East can also in part be interpreted in the same maimer.

The meaning of etiquette for Beeman is tied to exact stylistic variations employed in different contexts. In almost every case it involves the concealment (or the ability to conceal) true (or “inner”) feelings or opinions. Such control is regarded as a highly positive public virtue. Beeman further argues that a careful analysis of the use of ta^caruf indicates the shared notion of Iranians that the social order is inegalitarian and without reference to fixed rank or stratification. He argues that in Iran status is relative to specific situations of social interaction and that the weight of social obligations constantly shifts. The control and formal reserve of ta^caruf enable persons to avoid overly committing themselves to one course of action or set of assumptions concerning social ranking that might prove difficult to maintain if the relative position of persons should shift at a later date.

James Bill has concisely described how such conventions are related to social forms.[307] He argues that despite the existence of some formal organizations in Iran, notably the state apparatus, the exercise of political power is played out primarily within networks of informal factions, cliques, coteries, and ad hoc collectivities of all sorts. These networks of personal coteries are called dawra-s. Each dawra—the word literally means “circle”—is an informal group of individuals who meet periodically, usually rotating the place of meeting among its members. These circles may be formed around any of a number of ties: professional, familial, religious, intellectual, political, or economic. This form of consociation has deep historical roots. Sufi mystics and darvishes, for instance, formed dawra-s with their disciples, and many of the groups regularly meet in coffee houses—Bill says there are perhaps 2,000 of them in Tehran alone. Among merchants and craftsmen in the bazaar, membership in dawra-s often partially overlaps with that of guild.

One reason for the pervasiveness of such informal organizations is the suppression of formal ones on the part of the prerevolutionary Iranian state and by all appearances the postrevolutionary one. Even when formal political parties exist, most Iranians assume that real access to authority is through informal channels. The existence of personal ties is considered more important than ideological preferences. Dawra-s tend to fragment and re-form as the interests of their members change, and most individuals belong to a number of these circles.

From the intimate circles around the Shah in the past and the informal coteries that surround Iran's present leaders to the level of informal village politics, the style of the dawra permeates Iranian political life. If a governor visits a village, villagers presume, and with reason, that a request to his driver, secretary, guard, or even his guests constitutes an effective intervention. Iranians expend a great deal of energy in determining how best to approach persons for a given request. Similarly, in the last days of the Shah, members of the foreign press corps were surprised to find announcements as to the Shah's intentions made by persons with no formal capacity but who, in retrospect, were the most reliable sources as to what was going on. The successive postrevolutionary governments have shown a similar lack of clear lines of organization.

The dawra makes sense in a setting where the cultural assumption is that "real" power does not flow from institution to institution, as suggested by the formal apparatus of government, but from person to person and groups of persons who effectively manage to impose their authority. The common force that unites the membership of dawra-s is a personal one; relationships that are not face-to-face and created out of multiple obligations are not as fully trusted. And as each person belongs to a multitude of dawra-s, information is rapidly passed among them.

The underlying conception of asymmetrical interpersonal relationship means that Iranians tend to assume that their survival and success depend upon their ability to cultivate the right personal contacts and to use those contacts to achieve their goals. That attitude in itself does not sharply distinguish Iranians from Americans. Informal "circles," "crowds," and "cliques" exist in every society and are always deeply involved in political ties and administrative functioning. The real difference rests in the degree to which such perceptions and social forms in societies such as Iran are formalized and taken to be normative. "Circles" are culturally recognized or even stressed in Iranian social situations and also given sense and legitimacy through connection to, and meaningful association with, fundamental ideas about "natural" social relationships. To draw a parallel between two Middle Eastern contexts, the Iranian term of nazdik, which means "nearness" and which implies reliable close acquaintances, kin, or friends, has much the same contextual meaning as the North African notion of closeness introduced earlier in this book.

Another point made by Bill is that the Iranian assumption of the instability of social hierarchies is easily borne out in practice. In Iran’s recent past, gardeners, water carriers, stableboys, and the children of drivers have all had excellent opportunities for advancement provided they perform their services close to men of power. There are just as many opportunities for decline, and the scramble for personal power takes these shifts into account. Bill recounts the anecdote of the prominent Iranian who clips obituaries from all the daily newspapers (which contain lists of who attends funerals) in order to fill in and change when necessary a huge chart to figure out the intricate links between the living. When he needs to get something done, he uses the chart to figure but the appropriate persons to contact.[308] Important families and persons at all levels of Iranian society try to spread their members over a number of key positions because of the assumption that all offices and ranks are unstable. Bill even goes so far as to say that Iranian basketball teams are handicapped by how players are selected—personal ties—and the lack of an adequate concept of teamwork, so that “teams” are thought of largely in terms of competing individuals.[309]

In such a social order, the seeming pleasantries of ta^caruf acquire more significance. TaSaruf is a means of avoiding direct, decisive encounters in a political and social world considered with justice to be unstable. Pleasantries, courtesies, politeness, and flattery abound at every level of social encounter just as do uncertainty and doubt. Etiquette buffers opposing views, loosens actual lines of tension, and enables individuals to keep their options open to protect themselves against sudden shifts in political currents. Such styles are not Immutable and of course have their limitations. Some forms of bureaucracy and industrial organization require high levels of technical competence and persons are selected on the basis of these professional skills alone, not just personal connections.[310]

*** Conclusion

Throughout this book and in the present chapter I have emphasized the necessity of considering the patterns of meaning and social practice as they are found in each Middle Eastern setting. Nonetheless, the analysis of ideology and social practice in situations as diverse as Morocco, Lebanon, Iraq, Iran, and Israel discussed in this chapter suggests important points of “family” resemblance. It also suggests the importance of patterns of social order that would be given the approximate label of “informal” or even “nonstructured” in other contexts. Bill uses the term “plastic.” Out of context, such labels can be taken as pejorative. Each of the studies analyzed in this chapter makes sense of such flexible and pragmatic patterns of social action in the context of cultural assumptions concerning the nature of the social world which both informs these actions and serves as guides to them. Finally, an examination of recent accounts of world view and of social identity point to a renewed anthropological interest in how the relation between meaning and social practice changes historically. This is in marked contrast to an earlier generation of anthropological studies and one essential to making sense of events in the Middle East today.

* Part III: Islam and Religious Experience

** 9. Islam in Practice

*** Islam as a World Religion

All major world religions face the problem of how to keep their key traditions vital and meaningful over long historical periods and in diverse contexts. By definition, world religions are not confined to one society or cultural tradition. They transcend specific cultures, including their own culture of origin. The formative ideals and the expression of religious truths at the core of each great religious tradition are considered to be eternal and immutable. Yet for these ideals and truths to maintain their sense of reality in a sociological sense, they must be capable of reformulation and reinterpretation so that they enter meaningfully into local value systems and changing social realities. As with other great religious traditions, Islam is rich and varied in its creativity and expression, so much so that many Muslims, especially those who adhere to certain reformist principles, have difficulty in accounting for the diversity of Islam as it has been expressed over 1,400 years and in the context of varied cultural traditions. As a result, some Muslim and nonMuslim- scholars dismiss local practices which they think not to be in accord with “central” truths as non-Islamic or as incorrect understandings of Islam, even though persons who hold' such beliefs consider themselves fully to be Muslims. One Muslim intellectual, despite the general richness and sensitivity of his account of the Islamic tradition, has gone so far as to dismiss all “mystical” and popular understandings of Islam not in accord with his own notion of Islamic tradition as being perpetrated by charlatans and “spiritual delinquents” and accepted only by the ignorant? To account for these diversities, anthropologists in the 1940s introduced the notion of “Great” and “Little” traditions. When first applied, the Great Tradition/Little Tradition contrast had the effect of rekindling an interest in popular understandings of religion (among other social institutions) and placing these understandings in the wider context of complex societies; nonetheless, in many anthropological monographs this concept subsequently meant little beyond juxtaposing statements of Islamic principles as elaborated in standard Orientalist texts and by educated Muslims with inventories of local religious practices? The study of “trance” and “possession” states has also suffered from being relegated to the Little Tradition side of the Great/Little divide so that only recently has the study of such rites become more clearly related to comprehensive studies of concepts of the person and to religious understandings of the world?

Critical discussion of what is meant by Islam and Islamic tradition is needed both for analytical and practical reasons. Especially in recent years, a number of studies of Islam have appeared that combine attention to textual analyses, a venerable tradition in the study

of Islam, with analysis of the ethnographic and social historical contexts in which notions of Islam are developed, transmitted, and reproduced.[4] Earlier studies of Islam, based primarily upon either the study of key

Eickelman, Moroccan Islam: Tradition and Society in a Pilgrimage Center, Modern Middle East Series, 1 (Austin and London: University of Texas Press, 1976), “Ideological Change and Regional Cults: Marabout- ism and Ties of ‘Closeness’ in Western Morocco,” in Regional Cults, ed. Richard P. Werbner, A.S.A. Monographs, 16 (New York and London: Academic Press, 1977), pp. 3-28, “The Art of Memory: Islamic Education and Its Social Reproduction,” Comparative Studies in Society and History, 20, no. 4 (October 1978), 485-516; Emanuel Marx, “Communal and Individual Pilgrimage: The Region of Saints’ Tombs in South Sinai,” in Regional Cults, ed. Werbner, pp. 29- 51; and John P. Mason, Island of the Blest: Islam in a Libyan Oasis Community (Athens, Ohio: Ohio University Press, 1977). Perhaps the best single study of the Islamic tradition to date is Marshall G. S. Hodgson’s three-volume The Venture of Islam: Conscience and History in a World Civilization (Chicago and London: University of Chicago Press, 1974). Hodgson’s text is difficult but essential. Two brief review essays

concerning his study are useful complementary readings. These are Marilyn Robinson Waldman’s review of Venture, which appeared in the Religious Studies Review, 2, no. 3 (July 1976), 22-35; and Edmund Burke, III, “Islamic History religious texts or of certain types of religious experience (formal ritual of mysticism, for example), tended to concentrate upon the search for an Islamic “essence.” This earlier analytic tradition, which is still vigorous, in part coincided with the ideological premise held by many Muslims that Islamic beliefs and practices are unaffected by historical change.

Recent ethnographic and social historical studies suggest a more complex notion of Islamic tradition than can be extracted primarily from religious texts. As a consequence, the notion of an Islamic “essence” has been difficult to sustain. Although in practice recent studies by anthropologists and social historians of Islam differ widely from each other in analytic assumptions, they suggest that in almost every studied locale there are opposing conceptions of Islam. These opposing (or complementary) conceptions of Islam are distinguished by greater (particularistic) and lesser (universalistic) degrees of compromise with the social order. These opposing conceptions are co-present and in dynamic tension with each other. Some of these ideologies, such as those characteristic of “reformist” Islam and the beliefs of many educated Muslims, tend to be universalistic in that they are explicit and more general in their implications. Others, including what can conveniently be labeled as maraboutism in North Africa (“saint cults,” to be explained shortly, is a misleading gloss), are particularistic in that they are largely implicit and tied to particular social contexts. The co-presence of these alternative universalistic and particularistic ideologies, some of which are not formally elaborated, means that the strength of one or another ideological form cannot be attributed solely to its relation to a specific social context.

In what is perhaps an extreme reaction to the earlier analytic tradition which largely accepted the ideological premise held by many Muslims of the immutability of “true” Islamic belief and practice, an Egyptian Muslim anthropologist has suggested replacing the term Islam by islams, in order to emphasize better the diversity and vibrancy of the religious tradition which he seeks to interpret and to signal an analytic distance both from the Orientalist seeking of “essence” and from the theological tenets of some Muslims.[311] The intent of this chapter is to incorporate social historical materials with a survey of Islam today, in order to indicate the richness and variety of the Islamic tradition and some of the key components that are constantly refashioned to maintain its vitality and to provide a necessary critical perspective for placing monographs dealing with particular aspects of the Islamic tradition in their appropriate contexts.

Recognizing the lack of a common core of dogma, a problem which Zein accommodates by writing of islams, Bryan S. Turner has suggested that in the Islamic case it is better to talk of orthopraxy, the “commonality of practice and ritual,” rather than of orthodoxy, the “commonality of belief.”[313] Even this formula has its limitations, despite the growing consensus among many educated Muslims on at least certain elements of practice and belief. Nonetheless, delineation of some basic features of

Islam and the five “pillars” of faith serves as a useful point of departure for considering Islam as locally received and understood.

*** The Five Pillars

Islam is the only one of the major world religions to have had a built-in name from its very beginning in seventh-century Arabia. Islam (Ar. Islam) means “submission,” submission to the will of God. Whoever submits is called a Muslim. These terms occur repeatedly in the Quran. The word qur’an itself means both “reading” and “recital.” It is the word of God revealed to the Prophet Muhammad by the angel Gabriel. Something is known of how these revelations first came to Muhammad from verses in the Quran itself. First Muhammad saw a glorious being stand erect high in the sky toward the horizon; then this being came closer and closer to him. At first Muhammad thought the being was God Himself, but later he recognized it as Gabriel. No one is sure which part of the Quran was first revealed to Muhammad. Many Muslims think it is this verse:

thou shrouded in thy mantle, arise, and warn!

Thy Lord magnify thy robes purify and defilement flee!

Give not, thinking to gain greater and be patient unto thy Lord.[314]

(Sura 74:1-7)

Every word of the Quran is held by Muslims to be the word of God. In fact, Muslims believe that God had earlier communicated His word through other prophets, those recognized by both Jews and Christians. Muslims believe that over time the messages of these earlier prophets became distorted. So Muhammad was made the “Seal of the Prophets,” or the last one, to warn men one final time of their wrong ways and again to provide them with God’s word “in clear Arabic.”

Any translation from one civilizational tradition to another is treacherous, but a comparison with Christianity is useful here. The Quran should not be seen as precisely the equivalent of the Bible. Christians, or anyway most Christians, see the Bible as a record of the prophets and of Christ, but not directly as God’s word, as Muslims see the Quran. This is why many Muslims, even those who do not speak Arabic, place such great emphasis upon comprehension of classical Arabic and regard translations of the Quran as mere guides to its meaning rather than substitutes for the original. For Christians (or again, most Christians) it

is the person of Christ, the Son of God, that personifies God because Christ is God. In contrast, the Quran insists that Muhammad is merely the messenger of God. Some Muslims, especially certain mystics, have admittedly considered the person of Muhammad to be a saintlike figure, but most Muslims go no further than to consider Muhammad to be the most perfect of men. In fact, the tomb of Muhammad was destroyed in the late eighteenth century by zealous Wahhabi Muslims intent upon avoiding a personal veneration of the Prophet or of any other figures in Islam.

Clearly the belief in the Quran and the eternal nature of its exact message are important components of the Islamic tradition, but the word of God as embodied in the Quran is made meaningful to Muslims in different ways according to time and place. Problems of revelation and the legitimation of political authority, to take only two major practical examples, are interpreted in various ways throughout the Muslim world.

A Moroccan qadi, or religious judge, had this to say to me concerning how the Quran should be interpreted:

How can ordinary men, no matter how much they study, understand by themselves the words of the Quran? Those are high words, the words of God. Instead, you must look at what the Prophet did, the sayings of the Prophet, and the conduct and decisions of the Muslim community in the past. These tell you what is the sliarFa (the law of Islam or the “straight path”).

He then drew two parallel lines on a sheet of paper and explained that conduct within the two lines was permitted by Islam and that all else was not.

Since the Quran cannot be a direct guide to man’s conduct, one must turn to what is traditionally done by Muslims. Such a belief is not prevalent everywhere in the Muslim world but is an example of one of the ways in which the ideological notion of the immutability of Islamic belief can be maintained yet adjusted to accommodate local traditions. Much of what is considered to be Islamic practice depends upon consensus (ijma^ca) of morally upright Muslims, especially those considered to be religious scholars, in any part of the Muslim world. The notion of consensus has precise legal connotations in Islam, but here I am primarily concerned with indicating popular conceptions of religious tradition.

Every Muslim considers himself to be part of the umma, the community of living Muslims everywhere who are committed to what Hodgson has called the “venture of Islam.” The sharFa, the straight path of the ritual observances required in principle of Muslims, is only the most visible component of that venture. Muslims differ as to

who legitimately succeeded Muhammad in the leadership of the Muslim world—Sunni Muslims accept in principle the notion that any Muslim

could be Muhammad’s successor in all matters except prophecy, while the ShFa, principally located in Iran, East Africa, India, southern Iraq, Lebanon, and parts of the Arabian peninsula, feel that succession rightly belongs only to the descendants of Muhammad through his daughter Fatima and his son-in-law ^cA1I. There are many elaborations and intermediary positions of these principal themes. Despite these differences, Islam is thought of by Muslims as imparting a tone and style to all aspects of their lives—familial customs, sociability, learning, even for some Muslims styles of personal grooming. Shanna can be translated as “law,” but it is much more than the concept of law in English usage. Religiously speaking, the shari^ca governs all aspects of one’s conduct as a Muslim.

There are five “pillars” (pl. arkan) of Islamic faith incumbent upon most Muslims; I say most because some Muslims modify or deny the normative nature of even these pillars because of their own interpretations of Islam. These five pillars are the declaration of faith, the five daily ritual prayers, almsgiving, fasting, and the pilgrimage to Mecca.[8]

®There are a number of accounts of these obligations. One of the most concise is Gustave E. von Grunebaum, Muhammadan Festivals (New York: Henry Schuman, Inc., 1951). Another is contained in a handbook written for English-speaking Muslims, Muhammad Hamidullah, ed., Introduction to Islam, enlarged edition, Publications of the Centre Culturel Islamique, Paris, No. 1 (Hyderabad, India: Habib & Co., 1959). The account below of the pilgrimage, the fifth pillar, is based primarily upon von Grunebaum, Muhammadan Festivals, pp. 15-49; and the Aramco World Magazine, 26, no. 6 (November-December 1974).

The declaration of faith (shahada) is quite simply that there is no god but God and that Muhammad is His messenger (rasul). Like any living tradition, Islam in practice has varied enormously as it is constantly in the process of becoming. This simple declaration of faith has had the advantage of being so elemental that all Muslims can agree upon it, whatever other differences they may have had for thirteen and a half centuries.

The second pillar of Islam is the salat, or five daily ritual prayers. All Muslims are supposed to cleanse themselves ritually, face Mecca, and pray at dawn, noon, midaftemoon, sunset, and dusk. In towns, prayer-callers climb to the top of minarets, even when loudspeakers are prevalent today, and announce each of the prayers. Muslims may pray where they want; the use of mosques is not obligatory, although many believers congregate in mosques at least on Fridays for the midday prayers. The obligatory prayers are fixed in form and content, although personal invocations to God may be added to them upon their completion. The uniformity of these prayers is said by many to symbolize man's equality before God as well as the community's submission to His will.

Almsgiving (zakat) is the third pillar. In some countries at certain periods the zakat has been an obligatory tax upon all Muslims who can afford to pay it. The Quran enjoins the wealthier to set aside at least part of their wealth for the destitute of the Muslim community. Most almsgiving throughout the Middle East remains personal and direct; the donor has a more direct contact with his clients, unlike the anonymous pattern of giving which prevails in our own society.
